This is an evolving EBook - updated regularly to reflect recent developments in our understanding of capitalism and its exponentially growing impact on the social and natural environments which have sustained humanity through the past 10,000 years.

Minor revisions/additions occur regularly as new relevant studies appear and are integrated into the text - often as footnotes.¹

All versions are regularly updated to reflect these changes.

Chapter Headings

- 1.Introduction
- 2.Ideology, The World Economic System and Revitalization Movements
- 3.An Explanation and History of the Emergence of Capitalism
- 4.How Born Again Christians Rescued Capitalism
- 5.The Virtuous Capitalist, The Poor and the Wasteland
- 6.Capitalism and Work: the White Man's Burden
- 7.Capitalism and its Colonies
- 8.Global economic forces, Western realities:
From Protectionism to Neoliberal Free Markets
Do not go gently into that dark night!
- 9.Global Capitalism, Third World Development
- 10.The Nature and Importance of Public and Private Credit
Only Believe...

11. The Looming Catastrophe: Is this the way our world ends?
(Not with a bang but a whimper!)
12. Participatory Democracy: It is time to Reconstitute The Commons
13. A 'Perfect' Solution: Hypersonic Warfare
(Is **this** the way our world ends?)
14. The nature and limitations of our most vaunted capability, 'Human Intelligence',
15. Epilogue - What Drives Western People to Commoditize their World?
16. Addendum: We're All Equal! Independence and Exchange

Chapter 1: Introduction 🚀

 (05/05/21) (18/08/21) (14/05/22) (24/11/22) (26/01/24) (29/02/24) (29/01/25)

It is said that the aphorism 'Know Yourself' was inscribed in the forecourt of the Temple of Apollo at Delphi. Finding out who we are can be an unsettling experience.

Not only do human beings gild memories of experiences in their own lifetimes, they are extremely adept at reinventing those of their historical past. It can be an educative experience to strip away what the French philosopher Voltaire called the 'fable upon which we are all agreed'.

It's time we, living in capitalist countries, got ourselves into perspective ².

Over the past three centuries, people living in Western (capitalist) countries have increasingly imposed their understanding of reality on others. Now, they are becoming aware of a growing antipathy toward 'The West' around the world. Henry Hyde's view of the problems facing Western countries is not isolated,

Let us begin by accepting there is no single enemy to be defeated, no one network to be eliminated. Al-Qa'eda is but our most prominent opponent, but its outlook is shared by many others who are equally committed to our destruction... we know now that we have permanent, mortal enemies who will seize upon our vulnerabilities to bloody us, to murder our citizens, to commit horror for the purpose of forcing horror upon us...

*(US House of Representatives Committee on International Relations
October 3 2001)*

For the past decades the West has confronted what it perceives as a growing 'climate of terror' around the world. While estimates vary, it is reasonable to say that thousands of lives have been lost and billions of dollars have been spent in pursuing, capturing and killing those deemed a threat to the security of Western nations.

It is time to take stock. Before continuing to pursue phantoms and shoot at shadows (and, in the process, alienate thousands caught in the crossfire) we need to understand what is producing this apparently burgeoning antipathy toward Western capitalist countries.

Western capitalist nations, over the past several centuries, have attempted to re-organize the world to reflect their understanding of reality. Although we often fail to recognize it, this requires a far-reaching reorganization of people's lives in non-Western countries. It would be surprising if there was not, sooner or later, a reaction against such activity.

So, what is capitalism? What gives people living by capitalist understandings of the world such a determination to reorganize the rest of the world to their understanding? And, what impact does this attempt to reorganize the world have on people living in non-Western regions?

People living by capitalist understandings of the world have, over the past four centuries, felt driven to compel those who do not think and live as they do, to change. They have committed their lives to a refashioned world, to a capitalist world. So, what is it that has produced in Western people such a deep need to dominate and change the world?

Human beings (including members of Western capitalist nations) believe that they interact with 'objective reality', that is, a reality that exists independently of themselves and is perceived in the same way by all human beings. In every community, models are built from that assumed objective reality which, in the opinion of those who order their lives by them, provide the best ways of organizing life to make the most of the reality in which they live.

Western people hold a peculiar understanding of objective reality and believe they have a duty, a responsibility, to reorganize other people and communities to live by the understandings they hold. When people in other communities are subjected to Western capitalist demands for change, based on very different presumptions about 'objective reality', their understanding of their environment and of themselves in terms of their environment decreasingly 'makes sense'. They lose their sense of identity and self-worth as their indigenous status and prestige systems break down and brutality, despotism and corruption escalate in their communities.

Over time, people begin to realize that the problems they face and the disorientation they experience are connected to Western activity within their regions. Inevitably anti-Western sentiment grows.

We need to understand the nature of this very Western understanding of objective reality. To do so, we need to trace its emergence over the past thousand years of western European history.

Unless we do, not knowing our history, we might well, as Edmund Burke suggested, unwittingly repeat it.

This is the age of Capitalism.

In the following chapters I attempt dispassionately to explore the nature and history of capitalism ³. I leave it to you to decide whether it heralds a future of blessings or cursings.

The book starts with an examination of the nature of ideology and, more specifically, capitalist ideology. It is essential to start by examining the nature of ideological frameworks in human thought, interaction and action. This will enable us to get capitalism into contextual perspective.

With questions of the nature of primary and secondary ideology dealt with in Chapter 2, in chapter 3 we launch into an explanation and history of the emergence of capitalism in western Europe. We pose and attempt to answer the question:

★ How have the most basic presumptions which underpin Western understandings of life been shaped by history, becoming seen as features of the real world, the unfocused backdrop to secondary ideological disputes?

This exploration takes us from the 10th century to the start of the 18th century; the century when, in western European thought, 'the economy' became clearly differentiated from 'the social', a distinct environment with its own laws and interests.

In chapter 4 we explore the century in Western European history when the turmoil of previous centuries had distilled into a new version of 'objective reality' for those who held the reins of power.

Most importantly, it was the century when capitalism gained its evangelical fervor as millions of people, threatened with economic and social ruin, became 'born-again' Christians, the 'moral majority' of Western communities.

This was the century in which they would take responsibility for transforming the rest of the world to live by the reality they now lived in - starting with their own, home grown 'savages'. It was also the century in which the justification for natural laws shifted from divine decree to the innate characteristics of environments in a self-existent natural world.

In chapter 5 we investigate how capitalism became 'virtuous'. The 18th was the century when the merchant, trader and banker moved to center stage, the period when the newly respectable, and often 'born-again', capitalist became morally and socially respectable. As Adam Ferguson, a Scottish gentleman, explained,

... in the progress and advanced state of his art, his views are enlarged, his maxims are established: he becomes punctual, liberal, faithful, and enterprising; and in the period of general corruption, he alone has every virtue, except the force to defend his acquisitions. He needs no aid from the state, but its protection; and is often in himself its most intelligent and respectable member.

Adam Ferguson (1767 Pt 3, Section 4)

It was also the century in which, as Thomas Jefferson claimed, Western Europe,

...divided their nations into two classes, wolves and sheep. I do not exaggerate. This is a true picture of Europe. ...man is the only animal which devours his own kind; for I can apply no milder term to the governments of Europe, and to the general prey of the rich on the poor.

(Thomas Jefferson, 1787)

With the distillation of a new objective reality for Western Europeans - now recognized as 'capitalism', in Chapter 6 we examine the ways in which Western European responsible people set out to ensure that the indolent, the 'lazy poor', pulled their weight and learned to work. As Western Europeans gained control of the rest of the world, it would also be time to teach 'natives' the same lesson.

In the 19th century, it was time for Western Europe, in search of resources to feed its rapidly expanding industries and needs and wants, to invade the rest of the world. By 1914 it controlled more than 80% of the earth's surface.

This was the time of European empire. The time when Western European nation-states would attempt to become global in extent. In Chapter 7 we examine the establishment of 'nation states'. Western Europe's colonies were assumed to be the 'overseas' extension of its nation states. Their acquisition and reorganization enabled Western people to continue and increase their accumulation of material wealth and expand consumption.

Finally, we arrive at the 20th century, the century of electricity, of streamlined industrial production, of capitalist control of the world. In Chapter 8 we examine the experiences of Western communities and nations as they moved from:

- free markets, patchy welfare capitalism and piecemeal welfare legislation;
- to protectionism, regulation, and welfare states and then back
- to neoliberal free markets, scaling back of state welfare provision, and globalization of economic activity.

Following this exploration of Western economic realities in the 20th and 21st centuries, Chapter 9 turns the focus back to non-Western nations and communities and examines their experiences over the past seventy years. In the era of global capitalism, why are there so many 'failing states'?

The final five chapters deal with core issues in understanding the nature of Western capitalism in the early 21st century.

Chapter 10 examines the nature and importance of 'credit' in democratically organized and in *laissez faire* Western capitalist societies.

Chapter 11, entitled 'The Looming Catastrophe: Is this the way our world ends? (Not with a bang but a whimper!)' suggests that, in their drive to dominate their material and social worlds, Western capitalists have set a deeply unsustainable course into the future. They have, indeed, over the past two hundred years, myopically set about changing the world to their short-term 'advantage', discounting warnings which might require them to change their behavior. Now, it is increasingly clear that they have, finally, gone a step too far. The consequences for the world in which we live are already being written into the environments we share.

Chapter 12 examines the prerequisites for a truly democratic capitalist nation.

Chapter 13 focuses on the relationships which have developed, within the 21st century United States of America, between its president, Pentagon and the increasingly 'Western' military industrial complex.

Chapter 14 focuses on the the nature and consequences of Human 'Intelligence'. We fashion our worlds to reflect and reinforce our understanding of 'reality' and that 'reality' is community specific. It is a reality which has been historically fashioned by communities to enable their members to successfully interact with each other and with the environments in which they live. 'Multipolarity' is the Human condition which, over centuries, Western nations have assailed in a futile bid to enforce their 'reality' on the whole world.

Chapter 15 examines the nature of commoditization. It suggests that capitalism is the process of commoditizing reality. The world becomes a global marketplace where commoditized objects take pride of place. Everything can be bought and sold, and the driving force behind this buying and selling is the commoditized value of the objects, rather than their inherent use values.

Finally, Chapter 18 examines the peculiar definition of exchange which lies at the core of Western capitalism. It concludes that the economic models of capitalism are ideological models which incorporate all the most basic presumptions about the world and about human beings which are extant in Western communities.

Chapter 2: Ideology, the World Economic System, and Revitalization Movements †

Introduction

Human Beings organize Life using Historically Constructed Models

- Categorizational Models are Unique to Each Community
- Models Have Unique Combinations and Qualities of Relationships
- Primary ideology
- Secondary ideology
 - World economic system
 - Imposition of Western secondary models: The breakdown and revitalization of communities

Revitalization movements and fundamentalism

- Revitalization and dissident groups
- Non-Western revitalization movements
- Western revitalization movements

Conclusion

Introduction 🦋

 (23/12/17)

Those who live in capitalist communities have, over the past century, introduced their ways of organizing and interacting with the environment to people throughout the world. In doing so, they have set about re-organizing other communities to conform to the requirements of life in a capitalist world.

Vast amounts of 'aid money' ⁴ have been spent in other communities assisting them to develop capitalist institutions and practices. Development experts, trained in Western ⁵ universities, have dedicated their lives to improving the lot of 'under-developed' and 'less-developed' communities ⁶. Yet, the consequences of all the dedication, effort and resources committed to 'Third World development' seem to have produced very mixed results around the world.

To understand the process of 'development' and its consequences in non-Western communities, we need to understand the ways in which people organize themselves and their surroundings.

Human Beings organize Life using Historically Constructed Models 🦋

 (19/07/24)

Human beings are natural model builders. Before they can begin to interact with their world it must be imbued with meaning and that requires a set of criteria for categorizing and classifying experiences ⁷, and for connecting the classified experiences with each other.

If every individual had, from birth, to invent his or her own categorizational criteria, human beings would forever be trapped at the dawning of sentience. Meaningful communication between people would be severely limited. So it should be no surprise that newborn babies are not left to develop their own criteria for categorizing experiences.

Just as human beings teach their young to speak their native language, so they teach them, from birth, the indigenous criteria for categorizing their experiences and interconnecting those categorized experiences.

The criteria used in building a community's categorizational models are historically determined. So, to the extent that the community is isolated from other communities, its categorizational models will be unique to the community (just as a community's language is unique).

This is one of the reasons why anthropologists recognize that they should [handle apparent similarities between communities with extreme caution](#). One should never assume that 'models of kinship' or any other forms of social organization and structure can be applied across communities.

Categorizational Models are Unique to Each Community 🦋

 (04/10/23)

Consider, for example, the kinship categorization (or 'definition') of the 'elder brother' and 'younger brother' in Confucian Chinese families. The categorizational criteria that produce these related categories of persons are quite different from those that determine the definitions of older and younger brothers in, say, Anglo-Celtic Australia.

Few people in Anglo-Celtic Australia recognize the kinship elements 'elder brother' and 'younger brother' as categorically distinctive, carrying their own prescribed characteristics and sharing formalized rights and responsibilities (or reciprocal duties) that are distinctive to those two categories of persons.

Both sets of communities recognize the existence of older and younger brothers. After all, brothers, as male siblings of the same parents, exist in all communities. However, the characteristics they recognize and the relationships they presume between them are very different.

Kalman Applbaum (1998) sums up the Western understanding of 'horizontal' ⁸ relationships:

... [Western] individuals may be seen in relation to other individuals as free actors, free choice makers, whose unfailing goal of satisfying primordial needs and achieving the construction of self-identity are not compromised by such interferences as filial duty or custom.
(Applbaum 1998)

The chief characteristics of such persons are that they are autonomous and independent. They recognize rights and responsibilities as incentives and constraints channeling the pursuit of their independent 'needs and wants'.

The focus is on individuals attaining 'needs and wants' and the regulatory structures defining legitimate attainment of them (i.e. in economic terms - or is it ^{ae}*Star Trek terminology*? - the 'rules of acquisition'). The focus is only secondarily on other persons (whatever their kinship relationships might be) with whom one might or might not interact in achieving one's needs and wants.

The consequences of accepting the centrality of filial and other forms of reciprocal duty, as in Confucian China, may however, (as Confucius 500 BC ⁹ suggested) require that individuals are not seen as *free actors* pursuing individual needs and wants. Rather, they should be seen as *interdependent members* of a community who can only understand themselves and ensure their needs and wants through understanding and accepting their kinship and other communal responsibilities.

Confucius summed up the major formal focuses of reciprocal responsibility (which provide templates for other focuses of reciprocal responsibility¹⁰) in traditional China like this:

The duties of universal obligation are five and the virtues wherewith they are practiced are three. The duties are those

- between sovereign and minister,
- between father and son,
- between husband and wife,
- between elder brother and younger,
- and those belonging to the intercourse of friends.

Those five are the duties of universal obligation.

Knowledge, magnanimity, and energy, these three, are the virtues universally binding. And the means by which they carry the duties into practice is singleness.

Some are born with the knowledge of those duties; some know them by study; and some acquire the knowledge after a painful feeling of their ignorance. But the knowledge being possessed, it comes to the same thing. Some practice them with a natural ease; some from a desire for their advantages; and some by strenuous effort. But the achievement being made, it comes to the same thing.
(Confucius 1893)

'Unity in diversity' and 'harmony without uniformity' presume a shared 'universe' within which all entities are united.

At heart, the 'duties of universal obligation' presume two mutually reinforcing qualities or characteristics:

A deep and constant unity of all involved which pervades the whole of which **individual entities are expressions**; and

the separate identities of all involved, expressed through the reciprocal rights and responsibilities which guarantee 'harmony without uniformity': that 'unity in diversity' which binds all together.

To understand the nature of any reciprocal relationship (such as 'between sovereign and minister';... 'those belonging to the intercourse of friends') one needs to realize the essential, subliminally presumed unity of those involved.

It is that essential unity which underpins the necessary reciprocal rights and responsibilities which ensure the separate, unique identities of interacting individuals, groups and communities. Individual entities are defined by the particular qualities they share stemming from 'the duties of universal obligation'.

And, of course, the presumed reciprocities expressed in social relationships are always culturally specific, there is *no universally defined set of reciprocities* infusing 'human' relationships. As **Zhang Lihua says**, 'the cultural values of a country [and of its constituent communities] influence its national psychology and identity'

If a Western person is not aware of the very different relational presumptions built into Confucian ideas of reciprocal duty, he or she is likely to presume that the independent pursuit of needs and wants is central to involvement in such relationships.

Robert Westwood does this when he sums up the Confucian position from a Western perspective. He assumes that all individuals are 'free actors' who 'lose freedom' when they are required to accept super-ordinate or subordinate hierarchical status. It is this that allows him to speak about relative 'power' in hierarchical, interdependent relationships:

Challenges to authority and the 'natural' order are not countenanced. This is encapsulated in the Confucian precepts of the so-called 'Five Cardinal Relationships' or wu lun, which delineate a hierarchical power structure over key societal relationships. The wu lun are dyadic sets of unequal, mostly hierarchical relationships between emperor - minister, father - son, husband - wife, older brother - younger brother, friend - friend.

Although the power structure is differentiated and unequal (except for the latter), mutual obligations and reciprocities are inherent in the relationships. The person in the dominant position expects and receives obedience, deference and compliance, but in return should

respect the dignity of the lower party and provide appropriate care and concern.

(Westwood 1997, p. 459)

Tsui, Farh and Lih, however, sum up the differences in the following way:

... Chinese often view themselves interdependent with the surrounding social context, and it is the 'self in relation to other' that becomes the focal individual experience. This view of an interdependent self is in sharp contrast to the Western view of an independent self.

The latter sees each human being as an independent, self-contained, autonomous entity who (a) comprises a unique configuration of internal attributes (e.g. traits, abilities, motives, and values) and (b) behaves primarily as a consequence of these internal attributes (Markus & Kitayama, 1991).

This divergent view of self has implications for a variety of basic psychological processes (e.g. cognition, emotion and motivation) and may be one of the most fundamental differences between the East and the West in social relations.

(Tsui et al. 1997, p. 59)

Jerry Grey, a British-born Australian living in China since 2004, gives an enlightening explanation of some of the implications and consequences of 'this fundamental difference between the East and the West in social relations' in a video presentation entitled

^œ[*What is 9/9/6 and why does it cause so much consternation in the West?*](#)

The ^œ[transcript of the video is available here](#). As he concludes:

China is different to the west, people outside of China who don't understand this will complain and suggest that China is wrong to do this but the bottom line is that most of the people who do it in China do it for a reason and probably wouldn't change it even though they could.

A commenter pseudonymed *azharidris7092* expanded on this:

...this applies to all countries in the Asian pacific.. the level of twisted narrative by the west that has been [hurled] at the Asian pacific to belittle the Asian is quite nauseating.. another thing that make me sick is they also associate a certain type clothing with backwardness.. in Malaysia and Singapore some Chinese women walk around in what looks like pajamas.. they interpret this as the Chinese can't afford proper clothing.. I personally know a millionaire who walks around in flip flops and t shirts.. cultural detail like these should be taught in western schools..

Models have Unique Combinations and Qualities of Relationships

The categorizational models held in different communities not only have distinctive sets of categories and idiosyncratic placement of elements within categories, they also have unique combinations and qualities of relationships through which categories and their elements are interconnected.

It is very easy for a researcher or commentator to apply his or her own understandings of the nature of relationships to those observed in other communities. Westwood (1997) does this when he assumes that

hierarchical relationships must involve dominance and subservience, relative power and powerlessness.

These are features of relationships between individuals who define themselves as 'free actors'. They see relationships of dependence in terms of costs and benefits and degrees of loss of independence¹¹.

The independent self is quintessentially Western. The interdependent self, in one guise or another, is found in communities where individuals know who they are through the forms of relationship they recognize between themselves and other members of the community. They perceive rights and responsibilities as *qualities of the interactants* rather than inhering in the 'objects' of interaction (as rules of acquisition).

In such communities the rights and obligations of individuals in exchange relationships remain with the interactants rather than being attached to the objects of exchange. So, the other party in an exchange is the focus, rather than the needs and wants of the interactants.

In one case, the process of exchange (or interaction) tends to emphasize the separate identities (and, therefore, motivations) of the exchangers (leading to a stress on *independence*). In the other, it tends to emphasize their relatedness and reciprocal responsibilities (stressing *interdependence*). The qualities of the relationships invoked in exchange in the two orientations are very different.

Such interactional orientations tend not only to 'flavor' recognized relationships between people but permeate relationships connecting both elements within categories and categories themselves throughout the primary ideological frames (see 'Primary ideology' - below) of the communities. Not only are perceived relationships specific to communities, so too are the perceived qualities that inhere in relationships.

By definition, two individuals living in different communities will, therefore, have quite distinctive 'understandings' from each other. How similar their understandings are will largely depend on the nature of the historical connections that have existed between their communities and the degree to which the hegemonies¹² of their communities have interacted over time¹³.

Throughout their lives, people in communities are constantly corrected and disciplined whenever their interactions or their understandings do not conform to those considered accurate in their community. To quote Confucius, 'some acquire the knowledge after a painful feeling of their ignorance' through a process of 'teaching and learning'.

In order to understand the ways in which communities build their categorizational models and then from them construct models of community organization and individual interaction, we are going to address two related sets of structures. These determine how human beings, in any community, see 'reality' and then organize their communities in the 'best possible ways' to make the most of the reality they live in.

Primary ideology

The first set of structures is the set of categorizational models that all members of a community (or set of related communities) hold in common. If they did not hold these models in common they would find it very difficult to make sense of each other's organization, interaction, behavior and communication. We are going to call these fundamental organizational models *primary ideology*.

Processes of categorization require frameworks of categories and rules (in language these would be called 'grammars') for both the placement of elements of experience in those categories and the interconnection of the categories and of the elements of experience contained in them. The interconnections are, of course, 'relationships'.

Not only are the categories and the framework of those categories unique to a community (or set of related communities), so are the sets of interactional relations and the 'qualities' that are invested in those relations.

The criteria that produce both the categorizational framework and its internal categories and relations are *primary ideological presumptions*. These are the most basic understandings people have of their worlds, in terms of which categorization proceeds. Any attempt to alter these understandings attacks the ability of people who hold them to think, and therefore to interact meaningfully with their environments.

Most people, when asked to explain their understanding of primary ideological presumptions, find it very difficult (just as they find it difficult to explain why they place words in a particular order in their sentences or why certain words should always, never or only in certain contexts appear together).

One of the features of the presumptions is that they are taken for granted. Those who hold them often find it difficult to identify their features and usually presume that they are so 'self-evident' that they need no explanation or justification.

This makes it very difficult to research primary presumptions since people, anywhere, will consider questions related to the definition of the assumptions to be inane. One should not question the obvious, particularly when the people being questioned find it difficult to express their understandings or even focus on the issues being raised.

It needs to be remembered, however, that primary ideological presumptions are not universally held understandings of the world. They are the understandings that are required by the most basic categorizational models of the community. So, not only should they not be questioned, they cannot easily be altered. Changes in such assumptions occur over hundreds of years and produce strains and tensions in communities experiencing the changes ¹⁴.

People in any community inherit the primary ideology of their community in the same way that they inherit the language of their community. It is taught to them from birth or as Confucius put it 'some are born with the knowledge...'.

Every time a child makes inappropriate connections between objects, people or experiences, those around the child, who feel responsible for its upbringing, correct the child. They are ensuring that its 'understanding' (i.e.

its sets of categories, categorization within those sets and their inter-relationships) of the world approximates the understanding of the world held by the responsible people in the community (members of the hegemony).

All communities develop a range of acculturative processes and structures squarely aimed at ensuring that the primary ideology of the community is learned. People, throughout their lives, live by and conform to the presumptions of the fundamental categorizational models of their community. Even trivial deviations will be subjected to correction, in much the same way as people are corrected when their speech patterns deviate from accepted practice in their community.

Where the models are not held consistently or life is not organized in ways required by the primary ideology of the community, those involved are usually defined as socially or mentally defective in some way. They are, to one extent or another, in need of re-education or 'correction'.

Those who do not readily respond to correction are often considered dangerous - very often isolated from the rest of the community, or even killed (especially when community cognitive models are under attack and people feel a need to reassert the fundamental certainties of life, as in the *revitalization movements* we will consider shortly).

For some three to four hundred years Western Europeans became increasingly aware and fearful of the effects of madness as the fundamental presumptions of their primary ideologies were challenged and altered¹⁵. As Laura Nader put it:

Foucault (1967) demonstrates how changes in the concept of madness led to changes in diagnosis and treatment of the insane and of social attitudes toward them. He describes how changing perceptions of madness in parts of Western Europe from the medieval times to the end of the 19th century led to the separation of 'mad' persons from the rest of society, their classification as deviants, and finally their subjection to social control. He focuses on the cultural controls that led to the social controls; ideas about madness led to asylums for the mad.

(Nader 1997, p. 719)

In any community, members are certain that their primary ideology is not simply a set of categorizational models but is, in fact, the way the external world is ordered. After all, they have viewed and interacted with their world through that model since birth. Whenever something in the 'real' world seems not to fit their models (i.e. their understanding) they, usually subconsciously, change it so that it does. (This is what Westwood (1997) does in his description of relationships in Confucian Chinese communities.)

There is a continuous, but subliminal *ideological management of reality*. So, whenever people in a community investigate the 'real world' to see whether it fits their most basic understandings of life, they, inevitably, find that it does. As Nader says of the ways in which people understand 'the body' in different communities:

Images of the body appear natural within their specific cultural milieus. (Nader 1997, p. 719)

The primary ideology of individuals and communities is fundamental to the way they think and understand themselves and their worlds. They instinctively apply their primary ideological presumptions in classifying new

experiences and objects. Human beings, in applying their primary presumptions to new phenomena, inevitably reorganize 'reality' to fit their models rather than reorganizing their models to fit 'reality' (i.e. they act to *conserve* their understanding of their world and themselves) ¹⁶.

Secondary ideology 🐦

The second set of structures is derived from the common primary ideology of members of a community. These structures start from the presumption that the primary ideology is not a subjective set of categorizational models held by members of the community. It is the way the external world is organized, it is 'objective reality'.

The purpose of this second set of structures, which we will call *secondary ideology*, is to spell out the best possible ways of organizing community life, given the constraints of 'objective reality'.

There can be any number of secondary models in a community. What they all have in common is that they take the primary ideology and its presumptions, from which they are built, for granted. It is the unquestioned, *organized*, backdrop to life.

This second level of model building, as Claude Levi-Strauss explained, is not only designed to ensure that communities are organized and individuals interact in the 'best possible ways'. It is also designed to reinforce and perpetuate the fundamental features of their primary ideologies. According to Levi-Strauss:

[C]onscious models... are by definition very poor ones since they are not intended to explain the phenomena but to perpetuate them. Therefore structural analysis is confronted with a strange paradox well known to the linguist, that is: the more obvious structural organization is, the more difficult it becomes to reach it because of the inaccurate models lying across the path which leads to it.
(Levi-Strauss 1963, p. 282)

Many of the 'explanatory' models of communities confirm Levi-Strauss' observation. They affirm and reinforce the central presumptions of the primary ideologies of the communities in which they are built ¹⁷.

Community members 'instinctively' understand, and are cognitively committed to the basic presumptions upon which the secondary models in their community are built. They can readily weigh up the advantages and disadvantages of the secondary models available to them and so choose which of the models they will support and which they will oppose.

This, in Western communities, is known as 'political', 'social', 'economic' or 'religious' (or any mixture of these) deliberation, debate or activity. These are the models of which community members are conscious and about which they enter into dispute with and support one another.

It is taken for granted by those who espouse a model and organize life by it that their model is all about organizing the real world to maximize benefits to community members and protect the most important basic principles of life in their communities (the fundamental presumptions of their primary ideology). It is the other models, those they do not endorse, which are defined by them as 'ideology'. As Philip Williamson explains of the British conservative movement of the late 20th century:

Conservative politicians, intellectuals and publicists confused matters by denying they had any such thing, whether ideology, creed or doctrine; their concern was the real and the practical, 'ideology' being an infection among their opponents which it was their task to resist.
(Williamson 2003, p. 270)

In Western communities, since the collapse of the Soviet Union in the late 1980s and early 1990s, there is one dominant secondary ideology - capitalism, with a variety of derived models that offer variations on the major themes of capitalism ¹⁸.

People in Western communities, convinced that their dominant secondary ideologies are not ideologies but are the best ways of organizing objective reality, have imposed and continue to impose them, often with considerable force, on the rest of the world. This set of imposed Western secondary ideological models underpins and constitutes the world economy, perpetuated and reinforced by the almost irresistible hegemonic forces of globalization.

This imposition of Western secondary ideological models on non-Western communities (which have very different primary ideologies) leads almost inevitably to their disruption. Since human beings require a primary ideology in order to think and interact with their worlds, the imposition of secondary models which do not fit their primary ideological understandings, leads to mental and social confusion.

However, both those imposing the new models and those on whom they are being imposed do not recognize the existence of primary ideological models. Both assume that the dominant and apparently 'successful' Western secondary models are the most efficient and 'practical' ways of organizing a shared objective reality.

So, it is assumed, the problem for the victims of this hegemonic imposition is one of lack of 'education' and/or lack of 'discipline'. They, therefore, sponsor and accept educational and restructuring programs (which are based on the primary ideological understandings of the hegemonic powers) to tackle the burgeoning chaos. This exacerbates the problems of social and mental confusion in the receiving communities.

Many communities around the world, suffering the consequences of enforced reorganization of their worlds to fit the requirements of capitalism, are in various stages of disintegration - victims of the globalizing forces of international capitalism. As ^{ae}Wallerstein (1991) claimed, the imposition of economic organization and activity on the rest of the world by Western nations is not new.

Since the 16th century Western Europeans (and those First World countries that have their hegemonic roots in Western Europe) have become increasingly militarily dominant around the world. They have required the rest of the world to accept reorganization of their models and understandings. In doing so they have established and maintained a 'world economic system'.

World economic system 🌐

To understand the ways in which people live and organize their lives in the early 21st century we need to understand the nature of this world economic system. Unless we do, many of the most important influences on the lives of people in communities will be missed or misinterpreted.

Over the past fifty years there have been many attempts to explain the presence of this system. As Immanuel Wallerstein (1991) has said:

its peculiar feature is that it has shown itself strong enough to destroy all other [world-systems] contemporaneous to it.

In this article, Wallerstein provides a brief discussion of the nature of the 'world-system' as he understands it. His article is a response to an earlier article by Andre Gunder Frank, which was, itself, a critical response to a 1990 article by Wallerstein.

Wallerstein says that his 1990 article ^œ'[L'Occident, le capitalisme, et le systeme-monde moderne](#)' was written as a rebuttal of the belief that the world-system is an 'economic miracle' of Western industrialism. He says, those who claim this:

believe two things simultaneously: (a) something distinctive occurred in (western) Europe which was radically new somewhere in early modern times; (b) this 'something' was a highly positive or 'progressive' happening in world history. My position is that (a) was true but that (b) was distinctly not true.
(Wallerstein 1991)

Capitalism is based on an individualized, status-driven, open-ended accumulation and consumption of goods and services, requiring open-ended production. The basis for social status and self-definition in Western communities is peculiar. Systems of status and self-definition in other communities are equally peculiar to them.

Imposition of Western secondary models: The breakdown and revitalization of communities

Feudalism, while unique to medieval Europe, shares many of the characteristics of patron - client forms of communal organization and interaction around the world. It was a territory-based, patron - client system in which those higher in the hierarchy took responsibility for those below them. They 'parented' those who depended on them.

Feudal communities presumed an 'interdependent self' rather than an 'independent self'. The political organization directly mirrored the social system, and councils of people of similar hierarchical position met to determine affairs of their dependents ¹⁹.

On the other hand, capitalism is based on individual independence; the acquisition of an ever-expanding set of needs and wants and promotion of the individual rather than his or her responsibility for dependents. Its political frame, therefore, is democracy.

If one insisted on a feudally organized community accepting democracy as its political frame, this would directly undermine the 'parenting' responsibilities of hierarchically superior members of the community.

Democracy requires communities to be organized in terms of an 'independent self', not an 'interdependent self'. It is no more a universally applicable model of governance than is feudalism, and when communities are compelled to reorganize in 'democratic' ways, all their other understandings of life are automatically challenged.

If, in patron - client organized communities, those in superior hierarchical positions were freed from their parenting responsibilities, those who depend on them would find the world a very insecure and inhospitable place. Far from improving the lot of the poor, the imposition of democracy can disenfranchise them and strip them of those supports that have protected them in the past. Interdependent relationships are disrupted, redistributive processes dismantled, and poverty, anomie and violence escalate in their communities.

Thomas More (1516), in his book *Utopia*, described the consequences of such disenfranchising of the peasantry of England in the early 16th century, during the shift from feudalism to capitalism. The hero of his book, Raphael, was the guest of the 'Archbishop of Canterbury, Cardinal, and Chancellor of England':

One day when I was dining with him there happened to be at table one of the English lawyers, who took occasion to run out in a high commendation of the severe execution of justice upon thieves, who, as he said, were then hanged so fast that there were sometimes twenty on one gibbet; and upon that he said he could not wonder enough how it came to pass, that since so few escaped, there were yet so many thieves left who were still robbing in all places.

Upon this, I who took the boldness to speak freely before the cardinal, said there was no reason to wonder at the matter since... 'The increase of pasture,' said I, 'by which your sheep, which are naturally mild, and easily kept in order, may be said now to devour men, and unpeople, not only villages, but towns; for wherever it is found that the sheep of any soil yield a softer and richer wool than ordinary, there the nobility and gentry, and even those holy men the abbots, not contented with

the old rents which their farms yielded, nor thinking it enough that they, living at their ease, do no good to the public, resolve to do it hurt instead of good.

They stop the course of agriculture, destroying houses and towns, reserving only the churches, and enclose grounds that they may lodge their sheep in them. As if forests and parks had swallowed up too little of the land, those worthy countrymen turn the best inhabited places into solitudes, for when an insatiable wretch, who is a plague to his country, resolves to enclose many thousand acres of ground, the owners as well as tenants are turned out of their possessions, by tricks, or by main force, or being wearied out with ill-usage, they are forced to sell them.

By which means those miserable people, both men and women, married and unmarried, old and young, with their poor but numerous families (since country business requires many hands), are all forced to change their seats, not knowing whither to go; and they must sell almost for nothing their household stuff, which could not bring them much money, even though they might stay for a buyer.

When that little money is at an end, for it will be soon spent, what is left for them to do, but either to steal and so to be hanged (God knows how justly), or to go about and beg? And if they do this, they are put in prison as idle vagabonds; while they would willingly work, but can find none that will hire them; for there is no more occasion for country labor, to which they have been bred, when there is no arable ground left.

One shepherd can look after a flock which will stock an extent of ground that would require many hands if it were to be ploughed and reaped. This likewise in many places raises the price of corn.'
(More 1516)

A major problem in Third World (and, increasingly, in 'developed') countries is now not simply the grinding poverty of the poor, but the continuing costs of the conspicuous consumption of the rich. The imposition of forms of democracy (based on presumed independence rather than interdependence) and economic organization required by the world economic system have reduced increasing numbers of people in Third World countries to penury, with diminishing political, economic and social protection.

The imposition of democracy has been responsible for dismantling traditional forms of land tenure and utilization. It has eroded and disrupted social organization and communal support mechanisms.

In patron - client systems of governance it has disrupted the parenting responsibilities of hierarchically superior members of the community. This, in turn, has allowed those in positions of responsibility to accumulate wealth with less and less acceptance of patron - client responsibilities for former dependents (i.e. for *redistribution* of goods and services). ²⁰

There has been a considerable inflation of expectations and a very great increase in conspicuous consumption amongst some groupings in non-Western communities. This inflation of the material requirements of status positions is in many ways, though not all, similar to that which occurred in Western Europe from the late 15th century with the denial of hierarchical feudal responsibilities by those who controlled resources ²¹.

The effects of the 'trickle down' development policies of the 1960s and 1970s show how readily the requirements of status positions can be inflated. Particularly those which are primarily determined through non-economic criteria but reinforced by the acquisition and/or consumption of material goods and services.

One of the unfortunate consequences of the 'trickle down' policies of Third World Development projects and programs and the 'globalization' activities of the past 50 years has been that high-status people in many Third World communities have had the material requirements of their positions greatly inflated by the massive injection of capital into their countries.

Since they were not primarily geared to Western forms of open-ended production ²², the injected capital was diverted into existing social template activity and those of high status found themselves able to buy Mercedes Benz cars, live in mansions, have overseas assets, and engage in many other forms of excessive conspicuous consumption. Over the past half century the ownership and consumption of these luxury goods has become institutionalized.

As the injection of outside funds dried up with the failure of 'trickle down' policies, those who require these possessions to underscore status have had to find other sources of funds to obtain them. This has resulted in a 'trickle up' effect. Those of low status, dependent on high-status people in a variety of ways, have, through lowered wages, decreased returns on produce, decreased welfare support, and increased pressure on land and other income generating possessions, borne the brunt of the inflated expectations of elites.

In many non-Western communities and countries, as a result of the 'development' activities of the past half century, the relationships between lower and higher ranks of hierarchically ordered systems of status and community organization have become severely distorted. By insisting on the 'democratization' of communities run by 'dictators', the lowest ranks of hierarchical systems have effectively been disenfranchised ²³.

In almost all traditional patron - client systems wealth initially flows from the base (the peasantry in feudal Europe) upward through the hierarchy, creating concentrations of wealth in the higher reaches of the pyramid. Patrons, having accumulated wealth, take responsibility for the well-being of those below them, redistributing goods and services as needed and, in doing so, ensuring the continued and strengthened interdependence of patrons and clients in the hierarchy.

When such communities are 'emancipated' by Western development enthusiasts, the land and resources, having been vested in the upper reaches of the hierarchy, become their possessions and clients find themselves no longer entitled to the land and resources on which they have always relied. The lowest rankings of status hierarchies therefore find themselves facing very similar problems to those faced by the peasantry of Western Europe during the transition from feudalism to capitalism ²⁴.

Revitalization movements and fundamentalism

The consequences of this impoverishing distortion of status requirements and erosion of communities have been profound. The primary ideological presumptions of many non-Western communities have been challenged and organizational features of their secondary models dismantled.

Increasing numbers of people see the growing problems of their communities and uncertainties of their individual lives as stemming from Western-based activities in their countries and involvement of national leaders in Western forms of organization, activity and consumption. Eqbal Ahmad, in 1996, gave vent to his opinion of Western involvement in Muslim regions:

Our first encounter with democracy was oppressive. Democracy came to us as oppressors, as colonizers, as violators. As violators, they spoke in the language of the Enlightenment and engaged in the activities of barbarians

Historically the United States has spoken of democracy and has supported Somozas, Trujillos, Mobutu Sese Seko, Suharto of Indonesia, the Shah of Iran, Zia ul Haq of Pakistan

Therefore, our first experience with democracy was one of outright oppression, and our second experience with democracy was one in which [the West] promoted fascism, global fascism in some cases ²⁵.

They perceive the breakdown of law and order and the escalating violence that surrounds them largely as a consequence of Western intrusion and influence in their countries and communities.

Inevitably, as the perceptions crystallize, resentment of and resistance to Western forms of organization and activity mount. This, in turn, is reflected in Western attitudes and Western peoples become increasingly aware of a world of:

mortal enemies who will seize upon our vulnerabilities to bloody us, to murder our citizens...
(Hyde 2001).

Having lived through the second half of the 20th century in Western countries, with their increasingly hedonistic biases, I am impressed by the mounting fundamentalism of both Western and many non-Western communities. When life becomes increasingly difficult and apparently dangerous, then communities and individuals search for the reasons and for ways of reasserting order and security in their worlds.

People in the later medieval period in Western Europe became aware of, and increasingly vociferously denounced corruption and simony in their communities ²⁶, leading to the 16th century reformation wars. Similarly, very commonly, the problem in non-Western communities is seen as 'corruption': the loss of morality and/or commitment to the central principles of life in their communities.

The answer is seen to lie in determination to 'reform' their communities, to reaffirm and recommit themselves to the most important fundamental understandings of life, the central presumptions that underpin and give coherence to their primary ideologies, spelt out in one or more sets of secondary ideological models.

When those presumptions that are central to people's lives are perceived as being threatened, people everywhere reaffirm their commitment to the values which they know are necessary to ensure that life remains secure and ordered. They very readily become involved in activity aimed at reinforcing the forms of organization, interaction and understanding that are required by the fundamental presumptions of their primary ideologies.

They attempt to *revitalize* both communal and individual life. Inevitably, they do so through commitment to and enforcement of secondary ideological models derived from their primary ideological presumptions. These models are usually developed and promoted by a charismatic leadership, which demands and obtains from the bulk of the population unswerving loyalty to the principles of the espoused secondary ideology.

In writings on the late medieval world of Western Europe, the revitalization models and the movements associated with them have been referred to as 'The Reformation'. Their leaders were, almost without exception, identified with religious causes.

In the late 20th and early 21st centuries, examples of such movements abound in both Western and non-Western communities and countries: from the Ayatollah Khomeini and the Taliban (identified as religiously motivated); to George Bush in the United States in its early 21st century commitment to rooting out terrorism around the world and reaffirming and reasserting Western values wherever they appear to be under challenge.

Revitalization and dissident groups

The fact that the revitalization leadership promotes a particular secondary ideological model means that, however committed the bulk of the population might be to that leadership and the requirements of the model it promotes and protects, there will always be opposition from community members holding alternative secondary ideological frames.

Outside forces can, and do, exploit those minority groups in attacking the legitimacy of the movement. This, in turn, can result in the oppositional groups being considered in league with immoral, corrupting external forces.

Khomeini (1979) provided an excellent illustration of this when he described the emergence of factions within Iran, promoted and supported, he claimed, by foreigners:

[U]nfortunately we see that some differences are created within the opposition, that is between the secular and the Islamic factions. I must point out that the origin of these parties which have appeared in Iran since the beginning of the constitutional revolution, as one understands it, is that they were, without themselves knowing it, founded by foreigners, and some of them have served the foreigners...

When the foreigners see that there are people who are useful (for the country), people who, it is hoped, will be able to reform the country, they use all their energies to set them against each other; consequently, these people quarrel with one another, each one's writings oppose the other's, and they reject one another's ideas.

Some of them have done such things knowingly and were the primary agents of the foreigners, while others were not aware of what was happening, were not aware that they were being dragged down a road which went against the interests of their own country.

(^œKhomeini 1979 - accessed 26th July, 2010)

The 'Coalition of the Willing', comprising the United States, Great Britain and sundry camp followers, in its war against the Taliban in Afghanistan and the regime of Saddam Hussein in Iraq (2003 - ...), and in its fomenting of opposition to the fundamentalist leadership in Iran, has exploited such dissident groups.

However, to conclude that these dissenting groups are committed to Western secondary ideological principles, as many commentators in both the United States and other Western countries have, leads to unrealistic presumptions about the consequences of backing their overthrow of fundamentalist regimes ²⁷.

They also build their secondary ideological models from the basic presumptions of the common primary ideological frame which informs the models of the revitalization movement they oppose. They might, in order to win and maintain support from outside forces, speak the language of those forces from which they want support. However, it is foolish and naive to believe that the rhetoric employed for this purpose is indicative of the principles and models they are committed to promoting.

This failure to realize that the motivations of opposed factions within a country are derived from their particular understandings of themselves and the world is not recent in Western engagements with the rest of the world. It underlies most Western support of particular warring factions against others since the dissolution of Western empires following World War II.

A great deal of the Western literature on the Western invasions of both Afghanistan and Iraq demonstrates this continued presumption by commentators. They assume the commitment of dissident groups within those countries to the fundamental capitalist principles of the countries they are courting for support.

Non-Western revitalization movements

Among the many non-Western revitalization movements of the past fifty years one must include both the fundamentalist movement led by Ayatollah Khomeini in Iran from 1979 and the Taliban movement of Afghanistan in the 1990s. In one of his 1979 speeches Khomeini described those who supported the Shah and would try to reintroduce Western ideas to Iran:

Xenomaniacs, people infatuated with the West, empty people, people with no content! Come to your senses; do not try to Westernize everything you have!

Look at the West, and see who the people are in the West that present themselves as champions of human rights and what their aims are. Is it human rights they really care about, or the rights of the superpowers?

What they really want to secure are the rights of the superpowers.
(²⁸Khomeini 1979 - accessed 26th July, 2010)

Revolutionary Iran became an enemy of nations and communities that have their hegemonic roots in Western European history.

The United States, with Western European and Soviet support, fomented a war between Iran and Iraq, and supplied both weaponry and military training to Iraqi forces. For ten years revolutionary Iran endured a prolonged and savage war with Saddam Hussein's Iraq in which deaths, on both sides, numbered more than a million people.

It is the nature of revitalization movements that they often go to extremes. Those involved feel deeply threatened by 'corruption' within and by outside forces that promote immoral values and threaten their security and well-being.

They root out immorality among their own people and introduce often draconian measures to ensure compliance with the central presumptions of their moral code. They look for traitors - the enemy inside the walls - and attempt to weed them out. In the process there is, all too often, great human suffering.

So long as the threat of outside intervention continues to be perceived as real, hard-line fundamentalists gain a ready audience and strong support from the populations they lead.

Western leaders are as driven by their understandings of reality as are the leaders of non-Western revitalization movements. They are just as committed to protecting and reinforcing what they see as the most important fundamental principles of life. These Western understandings are often identified by non-Western revitalization leaders as forms of corruption against which they must fight.

All-too-often, Western leaders react to the resulting extremes and make the perceived threat a reality - as happened to Iran from 1980 to 1989 (and is now happening again) and as happened to the Taliban in Afghanistan in the first decade (and more) of the 21st century.

When they do so they ensure that the fundamental extremism they oppose is prolonged and strengthened. As the perceived threat from outside forces diminishes and the revitalization leaders become increasingly secure in their leadership, fundamentalist movements tend toward moderation²⁸. Max Weber (1947) described this process as the *routinization of charisma*.

Western commentators all-too-often misread that moderation as Westernization and trumpet the downfall of 'extremist leaders'. The ultimate democratization of Iran is an almost universal theme in Western literature dealing with the liberalizing tendencies in Iranian society (i.e. the processes of *routinization*)²⁹.

Western revitalization movements 🇺🇸

📅 (23/04/17) (26/03/19) (27/09/19)

The Western preoccupation with terrorism in the early 21st century is a fundamentalist reassertion of basic Western values. So is the declared determination to stamp out terrorism and reimpose 'democratic' principles of social and political life on those countries and communities that display or encourage anti-Western sentiments.

As with all such movements, the leadership demands loyalty not only from its followers but from all within the boundaries of its control. Alisa Solomon described the domestic climate of the 'war on terror'³⁰ in the United States:

Like any avalanche, this one started at the top, and likely dates back to the moment after 9/11 when President Bush warned the world's nations, 'Either you are with us or you are with the terrorists'. From Bush on down, in the months that followed, government officials drew limits around acceptable speech.

White House spokesperson Ari Fleischer told Americans to 'watch what they say'. Such words gained force when the Patriot Act gave the

government extensive new powers to spy, interrogate and detain. When civil libertarians began to protest the curbing of constitutional rights, Attorney General John Ashcroft offered a forbidding rejoinder:

To those who scare peace-loving people with phantoms of lost liberty, my message is this: Your tactics only aid terrorists.

These kinds of remarks from our government's top leaders, says Anthony Romero, executive director of the ACLU, have granted ordinary people license 'to shut down alternative views'. The Administration has fashioned a domestic arm of its new doctrine of pre-emption.

(^œ[Solomon 2003](#) - accessed 27 July 2010)

An editorial in *The Economist* (2003) described the mindset of the neo-conservatives who wielded considerable clout in the second George Bush presidency,

They see the world in terms of good and evil. They think America should be willing to use military power to defeat the forces of chaos.

Martin Sieff, in a *United Press International* (2003) commentary on the aftermath of the Iraq invasion of 2003, explained the ambition of those who championed the 'war on terror',

[S]o confident were Office of the Secretary of Defense planners and their neo-conservative allies of the coming oil bonanza from Iraq that they openly advocated using it, as Judis wrote in *The New Republic* 'to remake the Middle East in our democratic, capitalist image...'

(Sieff, United Press International 2003)

John Judis explained their ambitions clearly:

...the neoconservatives inside and outside the administration take a radical, even revolutionary, view of what is possible and desirable in the region; they see turmoil as inevitable and desirable. Says one senior administration official, "Upheaval is on its way. We might as well get in front of it." They see Saddam's ouster not just as a means of preventing a future nuclear threat but of remaking the entire region along democratic, free-market lines....

The neoconservatives don't worry about offending potential critics in Iran, Saudi Arabia, or Syria because they think of them as enemies who should eventually be swept aside by the installation of a democratic, free-market Iraq on their borders. They reject U.N. or multilateral participation in a post- Saddam transition.

Says one senior official,

This is the moment where our ideas will be vindicated, or we can walk away. You can't count on the international community to establish a new democratic or political order.

The way it would work is that the reigning power would distribute power and businesses, and which people it chooses to deal with are automatically made into kings. Do we want to be the kingmaker, or do we want to default that over to the U.N.? I am not sure we want to cede it.

I would bet the U.N. would seek the acquiescence of Iraq's neighbors-all of which have vested interests. There are three that would be problematic: Riyadh, Tehran, and Damascus. And the U.N. would work through them.

(John B. Judis, ^œ[Over a Barrel](#), *The New Republic*, January 20, 2003)

 (25/04/17)

Fifteen years later, the problems posed by neoconservative [hijacking of US instruments of power](#) remain potent. As Judis explained, 'neoconservatives inside and outside the administration take a radical, even revolutionary, view of what is possible and desirable' around the world. And, with weak, seemingly rudderless leadership in Washington, they have, once again, moved to assert their influence and ambitions on those who seem incapable of formulating coherent plans of their own ³¹. The Project for a New American Century has been superseded by the ^œ[Foreign Policy Initiative](#), but, as its website has explained, its stated aims remain unaltered.

William Rivers Pitt has bleakly summed it up:

...The ragged remnants of the neo-conservative cabal that came together under George W. Bush is still out there, plotting and scheming, concocting novel new ways to light the world on fire for power and profit.

The Project for a New American Century (PNAC), think-tank mothership for every bad neocon idea that led us into Iraq and a wider conflict in the Middle East, never died; it just got new offices down the block. Unlike their counterparts in the current administration, the neocons know how the gears of government work, where the levers are, and how to actually get things done.

Combine the wild fervor of Trump's band of wreckers with the ice-eyed competence of the neocon assassins, and the result could be horrific beyond any known measure.

(William Rivers Pitt, ^œ[The Looming Neocon Invasion of Trumpland](#), *Truthout*, Op-Ed, April 22, 2017)

Neo-conservative leaders of the United States of America, and their allies in other Western countries, *know* that capitalism and democracy are not ideological models, but the way the objective world is (or must be) organized. They have a duty to ensure that wherever dark, dangerous and irrational forces are at work, attacking democracy and capitalism, those forces are challenged, their supporters eliminated ³².

 (18/01/16)

As Western communities feel themselves threatened by the growing influence of what the United States' President George W Bush called 'the axis of evil' they know that, at all costs, the evils of anti-capitalism and anti-democracy must be challenged and beaten back³³.

Henry Hyde, Chairman of the US House of Representatives Committee on International Relations spelt it out, on October 3 2001, weeks after the destruction of the twin towers of the World Trade Center in New York:

Let us begin by accepting there is no single enemy to be defeated, no one network to be eliminated. Al-Qa'eda is but our most prominent opponent, but its outlook is shared by many others who are equally committed to our destruction.

If we believe that our safety can be secured by destroying any one organization or any single person, we will only ensure that we will remain unsafe and unprepared once again. For we know now that we have permanent, mortal enemies who will seize upon our

vulnerabilities to bloody us, to murder our citizens, to commit horror for the purpose of forcing horror upon us....

Our strategy, plans, and actions must be comprehensive, deliberate and formulated for the long-term. We must be prepared not only to protect ourselves from new assaults, not only to intercept and frustrate them, but to eliminate new threats at their source. This must be a permanent campaign, similar to the ancient one humanity has waged against disease and its never-ending assault upon our defenses.

(^œ[Hyde, October 3 2001](#) - accessed 27 July 2010)

 (29/02/16)

In such times, human beings feel the need to reassert and reinforce those principles that they instinctively know to be central to a properly ordered and secure world. Equally, they know, beyond any doubt, that unless they resolutely and uncompromisingly confront the enemy, intent on destroying it, it will destroy them.

As Henry Hyde (2001) claimed, one of the major terrorist threats against Western nations at the start of the 21st century has been perceived as coming from Al-Qa'eda ³⁴. For Hyde and most other Western leaders the organization is a network of terror and evil, master-minded by a Saudi Arabian, Sheikh Usamah Bin-Muhammad Bin-Ladin.

Bin-Ladin spelt out his reasons for seeing the activities of the United States (and Western countries in general) as a plague, destructively consuming the resources of his country, undermining the most important central understandings of life, and threatening the unity, security and well-being of his people and his world:

The Arabian Peninsula has never - since God made it flat, created its desert, and encircled it with seas - been stormed by any forces like the crusader armies now spreading in it like locusts, consuming its riches and destroying its plantations. All this is happening at a time when nations are attacking Muslims like people fighting over a plate of food. (Bin-Ladin, ^œ[Text of Fatwa Urging Jihad Against Americans](#), 1998 - accessed 20/03/2016)

Just as Henry Hyde insisted that the enemies of democracy and capitalism must be eliminated, so Bin-Ladin insists that those who threaten the existence of his world must be eliminated.

The more threatened people feel, the more strongly they recommit themselves to those fundamental primary ideological principles, which they *know* will reassert order and security within their communities and lives.

In the West, people during the threatening years of the 1970s and 1980s recommitted themselves to fundamental economic doctrines. In the early years of the 21st century, under the fundamentalist leadership of the second George Bush and his coterie of 'born again' believers in the efficacy of 'Western democratic principles', Western communities remained committed to globalization, privatization, economic growth; reducing public expenditure; re-imposing democracy (the political frame of Western capitalism) wherever it has been weakened or displaced and to eliminating those who most vociferously oppose their activities.

Because Western people organize their lives through economically focused social templates, the forms they re-emphasize in times of stress and threat focus on economic issues and are aimed at rectifying economic processes

and bolstering economic performance on the presumption that this will alleviate the perceived problems.

In the last decades of the 20th century Western countries and communities recommitted themselves to the fundamental principles underpinning free-market capitalism. Since that time they have also recommitted themselves to ensuring that the fundamental principles of capitalism and its political frame - democracy - are enforced and reinforced wherever 'anti-Western' sentiments seem to be mounting and capitalism seems to be losing its influence.

In 2016, a newcomer has joined the pantheon of evil-doers against which the West must wage relentless war. Al-Qa'eda, still active in the continuing destabilization of both Iraq and Syria, has become an 'almost moderate' insurgency, paling into the background as ISIS, the 'Islamic State of Iraq and Syria', has become the new face of international terrorism.

Now, the West, and The United States of America, as champion of 'Western values', is preoccupied with 'home grown' terrorists, inspired by or belonging to the new 'Islamic State'. The 'war on terror' has become domesticated within Western territories.

As Henry Giroux has explained,

The United States is now addicted to violence because the "war on terror" relies on an extreme fear and hatred of those considered enemies. As a result, it feeds the machinery of permanent warfare by constantly inventing a demonized Other. I think basically that terror is now such a central part of the political nervous system in the United States that it's become the major organizing principle of society.

The discourse of war, violence and fear now largely mold our conception of ourselves, our relations to others and the larger world. The defining vocabularies of American life undercut the possibility of challenging the assumption that violence is the most important tool for addressing social problems.

In this instance, the "war on terrorism" has created a war culture that works through various cultural apparatuses from the schools to the mainstream media to produce what amounts to a society steeped in violence. The United States is a country saturated in the discourse of war and violence, and this is partly evident in the widespread use of metaphors of war, extending from the wars on drugs and crime, to the "war on terror" and the so-called war on Christmas.

(Leslie Thatcher, interview with Henry A. Giroux, [œHenry Giroux on State Terrorism and the Ideological Weapons of Neoliberalism, Truthout](#), 28 February 2016)

The first Western leader in the second half of the 20th century to steer her country determinedly toward a Western fundamentalist future as a means of arresting and reversing the moral decline of the nation was the [British Prime Minister, Margaret Thatcher](#).

As a prime minister representing the newly energetic right wing of the Conservative Party (the 'Dries', as they later called themselves, as opposed to the old-style moderate Tories, or 'Wets'), Thatcher advocated greater independence of the individual from the state; an end to allegedly excessive government interference in the economy, including privatization of state-owned enterprises and the sale of public housing to tenants; reductions in expenditures on social services such

as health care, education, and housing; limitations on the printing of money in accord with the economic doctrine of monetarism; and legal restrictions on trade unions.

The term Thatcherism came to refer not just to these policies but also to certain aspects of her ethical outlook and personal style, including moral absolutism, fierce nationalism, a zealous regard for the interests of the individual, and a combative, uncompromising approach to achieving political goals.

(^œ[Encyclopedia Britannica](#) [accessed 27 May, 2018])

The following readings provide an insight into the kinds of social reorganization that Western people felt they had to undertake in order to ensure that life was secure and that the world remained 'sane' in the latter part of the 20th century.

Milton Friedman (with Rose Friedman) (1980), the theoretical mind behind a great many of Margaret Thatcher's policies in the early years of her British government (1979 - 1990), provided an explanation of the essential requirements for:

... building a society that relies primarily on voluntary cooperation to organize both economic and other activity, a society that preserves and expands human freedom, that keeps government in its place, keeping it our servant and not letting it become our master.

(^œ[Friedman & Friedman 1980](#))

^œ[Stelzer \(1992\)](#) described the 'decline' of Britain between 1945 and 1979 and gives a very positive summing up of the achievements of the Thatcher Government in reversing that decline. As Irwin Stelzer says:

It was individual responsibility, rather than reliance on government, that now became the accepted standard against which to measure policy initiatives.... Thatcher restored to the UK a sense that appropriate policies and driving entrepreneurialism can produce steady increases in material well-being.

(Stelzer 1992)

^œ[Stuart Hall's \(1988\)](#) analysis of Thatcherism provided a Marxist perspective on the precursors and consequences of Margaret Thatcher's privatization policies.

As we suggested earlier, within any community of people who share a common primary ideology, there will be a range of secondary ideological models. Friedman and Stelzer provide explanation of how the world should be organized and people interact with each other from the perspective of one set of Western secondary ideological models. Hall presents an alternative, dissident way of organizing the world.

Both perspectives share a common set of primary ideological understandings. Underlying both neo-conservative (right) and Marxist (left) emphases and perspectives is a level of common understanding:

- ★ All share similar understandings of the nature of time and of the ways in which it should or should not be 'used'.
- ★ All accept that there is an economic sphere or domain or environment within which people interact in order to achieve greater personal well-being.

- ★ All accept that the aim of government is to organize the 'public arena' to ensure improved economic organization and performance.
- ★ All assume that there is a 'private' realm or environment within which individuals interact. The disagreements concern the relative duties and responsibilities of private and public spheres.
- ★ All assume that human beings are 'free actors' and that human relationships are based on independence not interdependence.
- ★ All assume that prime aims in life include earning a cash income; improving one's material position; 'developing' oneself.
- ★ All assume that there is a 'formal' economy and that, necessarily, people will interact in terms of that economy in the ways which are spelt out as 'legitimate' and 'appropriate'.
- ★ All presume the 'rule of law'.

Conclusion 🐦

Commentators on life in non-Western communities and countries always have been, and always will be faced with the problem of disentangling themselves from their own primary and secondary ideological commitments in order better to understand the primary and secondary ideological presumptions and commitments of the people amongst whom they are undertaking research.

This has never been more important than it is in the early 21st century. Despite (or, more likely, because of) the driving commitment of Western communities to globalization and democratization in countries and communities around the world, increasing numbers of people in non-Western communities are seeing people of the West not as harbingers of good, but as exploitative, immoral, and intent on destroying the most important fundamental understandings of life in their communities.

People in the West are certain that their understandings and forms of organization and interaction are derived from the nature of objective reality and provide the most efficient, equitable means of ensuring individual (and therefore communal) development and well-being. Forces that oppose Western forms and understandings are therefore irrational and dangerous to the well-being of human beings everywhere.

So, they are determined, wherever they find 'fundamentalism' and its associated 'terrorist' activity to oppose them and finally displace these evils by those forms of organization and interaction to which they are committed. That Western determination to impose their own fundamentalist agenda on the rest of the world, if the reasoning contained within this chapter is valid, ensures the perpetuation and deepening of the forces they oppose.

Like it or not, Western people live in a world of diverse primary and secondary ideologies (which only make sense in terms of the primary ideologies from which they are derived). Every attempt to impose Western secondary ideological models on people who do not share Western primary ideological understandings guarantees the disruption of their communities and ultimately the emergence of revitalization movements aimed at reasserting and reinforcing their own understandings of life.

Chapter 3: An Explanation and History of the Emergence of Capitalism †

The emergence of Capitalism

People and recognized 'environments'

- The 'economic' environment

The development of systems of law

- The Feudal 'Secular Domain '
- The Feudal 'Spiritual Domain'
- The Investiture Conflict
- The need for Written, Centralized, Secular Systems of Law
- The Aquinas Solution: Natural Law Distilled from Secular Experience

'Money-making' patron-client networks and an emerging emphasis on quantification

Autonomy and systems of law

The separation of states and commerce

From personalized, cooperative hierarchical relationships to object-oriented, competitive oppositional relationships

The alienation of property and stress on legally bounded confrontation

- Using Law to Rob the Poor and Dispossess the Weak

Private ownership, consumption and accumulation

From the subversion of tradition to plotting the future

- 'Public' V 'Private': Oppositional Couplets; Categories of Likeness
- They should Become "Habituated to Labor and Fatigue"

Conclusion

In a way which is common to people in all societies, people in Western communities, when considering the fundamental rights and responsibilities of community members towards one another, speak in ideological terms.³⁵

While each Western secondary ideological frame spells out a particular version of 'reality', they all presume certain fundamental understandings about the nature of individuals, communities, the environment, and the metaphysical realm, and about the forms of relationship found in and between them.³⁶

It is from these less than consciously held basic presumptions that individuals and communities construct their own particular variants of 'ideal realities' (or secondary ideologies)³⁷.

To communities which do not share Western primary ideological presumptions, the confrontations among competing Western secondary ideologies will appear less than rational. Because their own forms of secondary ideology are based on their own primary ideological presumptions about life, which are likely to be very different from the basic presumptions contained within Western primary ideology, it is very difficult for them to enter into a dialogue with Western people.

Rather, as has happened during the last half century, people become opposed on the basis of subconsciously held basic presumptions about life, rather than on the basis of variant secondary ideologies. So, we speak of the confrontation between 'Islam and the West', rather than about a confrontation between Shiites and capitalists. What we have is a confrontation between primary rather than secondary ideologies.

Through this century, as non-Western communities become increasingly self-assertive, we are likely to find that confrontations will occur between communities holding variant primary ideologies - variant sets of basic presumptions about the meaning, purpose and organization of life ³⁸. These presumptions, being reflections of the basic cognitive frames of communities, will be poorly expressed. Those who attempt dialogue based upon such confrontations will find the explanations and basic positions of their adversaries rationally and logically unconvincing.

Before we can grapple with the confrontations which are already occurring and will repeatedly re-occur throughout this century, we need to comprehend the basic presumptions underpinning Western capitalist understandings of life. In this discussion we will attempt to do this through exploring the historical experiences which shaped and molded Western European communities over the past thousand years as they moved from feudalism to capitalism.

How have some of the most basic presumptions which underpin Western understandings of life been shaped by history, becoming seen as features of the real world, the unfocused backdrop to secondary ideological disputes? ³⁹

Here I will examine:

- ★ the ways in which 'the economy' became separated from other 'environments' in Western thinking ⁴⁰ ;
- ★ the emergence of an emphasis on 'market exchange' as the 'correct' form of exchange between individuals and groups;
- ★ the reasons why formal economies are so strongly bound by legal frames and supported by both legal and fiscal bureaucracies;
- ★ the nature of 'consumerism' and its historical underpinnings;
- ★ and why those who became committed to Western ideologies became so missionary-oriented, focused on the material world and convinced of the need for the whole world to be organized according to their ideological understanding ⁴¹.

In the examination of these issues I am going to look at some of the historical experiences of Western Europeans which have, over more than eight hundred years, produced the consumer culture of today. To understand the present we have to know the experiences of the past which shaped and molded Western European thinking and action and produced the primary ideological presumptions which underpin interaction, meaning and organization in Western communities.

People and recognized 'environments' 🐦

Fundamental to understanding Western primary ideological presumptions is an understanding of the ways in which people conceive of and interact with their *environments*. In order to grapple with the ways in which Western Europeans conceive of themselves in relation to their environments, we need to understand several important fundamental assumptions ⁴² from which they operate.

- ★ First, all human beings are *individuals* who *independently* interact with the various environments within which they live, and develop their own unique personas through that interaction.
- ★ Second, these independent individuals are autonomous fashioners of their environments, which are passive, being molded by, and reflecting, human activity.
- ★ Third, individuals interact with a number of quite distinct environments:
 - ✳ There is the *physical* or *material* environment, bound by *natural* laws. For Western people, the 'natural world' can be controlled and directed by mastering sets of laws which relate to its various aspects - those of physics, chemistry, geology, botany, and so on.
 - ✳ There is the *social* environment bound by *social* laws, again controlled and directed through understanding and applying sets of laws - the economic, political and social. The search for, and outlining of, such sets of laws has produced a reification of these aspects of social life, so that most Western people think of each area as a self-existent whole, as an environment with its own *raison d'être*, and, its own logic.
 - ✳ And there is, for many Western people, approximately eighty per cent of the population in most Western national censuses, a spiritual, or religious, or *metaphysical* environment bound by its own quite distinctive sets of laws.

The set of laws ordering each environment is self-contained. The rules for interaction with, and in, each environment can be spelt out, providing people with all the necessary information for interacting in the best possible ways with each of those environments.

This belief has led Western people to assume that the sets of laws can be 'discovered', understood and mastered through research and education. Through mastering the principles and rule requirements for interaction with each environment, the best possible forms of behavior, attitude, organization and interaction for individuals and groups can be determined. Once those best possibilities have been outlined and people commit themselves to living in accord with those possibilities, both individuals and communities become 'developed'.

Once Western researchers have determined the fundamental laws for interaction with each recognized environment, they are able to *prescribe* the *best* forms of activity and organization for any community. They are therefore able to evaluate the performance of any community in terms of their prescriptions.

The sets of prescriptions reflect, of course, the secondary ideologies of Western communities. The presumption of the existence of a range of separate environments with which people interact is, however, a *primary*

ideological presumption, one which is basic to the ways in which Western people think and organize their lives, no matter what secondary ideology they might subscribe to.

So, the keys to *development*⁴³ are:

- research to ascertain the principles underlying human interaction with each Western environment, together with the ways in which the environments might be reorganized for individual and community advantage;
- establishment of the bureaucratic frameworks through which the activities of individuals can be focused and channeled to the requirements of those prescriptions;⁴⁴
- and education of people to live by those principles, so ensuring physical, social, political, economic and spiritual well-being.

Rathbone Gregg, in the 1870s, put the need for education very clearly:

The lot of man ... is in his own hands, from his being surrounded by *fixed laws*, on knowledge of which, and conformity to which, his wellbeing depends. The study of these and obedience to them form, therefore, the great aim of public instruction. Men must be taught:

- 1.The *physical laws* on which *health* depends.
- 2.The *moral laws* on which *happiness* depends.
- 3.The *intellectual laws* on which *knowledge* depends.
- 4.The *social* and *political laws* on which *national prosperity* and *advancement* depend.
- 5.The *economic laws* on which *wealth* depends.

(quoted in ⁴⁵Holyoake 1896, p. 85)

Western people find it *natural*⁴⁵ that all activity should be circumscribed by rules and regulations. Rarely, if ever, has there been such an acceptance of and compliance with systems of rules and regulations as exists in Western communities⁴⁶. But, because those rules are applied by impersonal bureaucracies, they are not seen as intrusive.

Western people regard rules and regulations as necessary for the protection of their individuality and a guarantee of their right to interact with their environments for their private ends⁴⁷. Since the 12th century, Western Europeans have increasingly committed themselves to uncovering *systems of law* governing the various environments, and to educating people to live in accordance with them once they have been uncovered.

Among the reasons for the phenomenal success of Western Europeans in imposing their world views on others throughout the 19th and 20th centuries is their absolute certainty of the superiority of their 'knowledge' of how the physical, social and spiritual worlds 'really work', and their ability to impose on others well-organized systems of law and government, centered not on individual personalities but on impersonal bureaucracies.

Western people have come to believe that, whereas all other people live in the mists of superstition and dubious rationality, governed by the whim of their rulers, they have discovered the 'laws' of the physical, social and spiritual worlds. So, they can act 'rationally', ensuring that all their behavior,

interaction and organization conform to those principles which underpin the rule-bound systems they are in the process of uncovering.

When Europeans imposed themselves upon the rest of the world during the 19th and 20th centuries they took with them the 'best' ways of using the physical environment, of organizing communities, and of ensuring individual 'development' and a successful life in the next world. They therefore set about changing the worlds they encountered in terms of their understandings.

The physical environment could (and should) be dominated, managed and organized to 'realize its potential', that is ensure high yields, whether of minerals, crops or anything else which Western people might consider a 'potential' for that environment (e.g. 'tourism').

The social environment could (and should) be managed and organized to 'realize its potential', to ensure individual development (defined, of course, in terms of the particular secondary ideology of those holding the power).

And the spiritual environment could (and should) be managed and reorganized to ensure high rates of conversion and commitment to the religious forms and beliefs of Europe (which would not only ensure life in the next world, but also orient people to be responsible citizens in this ⁴⁸).

Not only were Western Europeans committed to systems of laws, rules and regulations, they also strongly emphasized the use of mathematics to measure success by quantifying results. This emphasis on quantification coincided with yet another emphasis, that on material possessions, on the accumulation of goods and the generation of material wealth.

Industry and frugality would inevitably produce riches. The demonstration of these virtues, in turn, would inevitably bring respect and status. So, in order to attain and maintain status and respect, one needed to demonstrate that one had gained wealth *by one's own efforts* - *that one had realized one's own potential and the potential of the environments within which one lived*.

One's material *worth* is most easily ascertained by giving cash values to possessions so that a total value can readily be calculated by interested others. This led 'naturally' to conspicuous consumption and ownership, demonstrating the wealth of the person. And so there emerged, in Western Europe, apparently paradoxical emphases on hard work and frugality on the one hand, and increasing conspicuous ownership and consumption on the other.

Of course, Western Europeans are convinced that these emphases are 'logical', and necessary for the 'rational' direction and control of the environments within which they live.

Whereas almost all other people are bound by 'tradition', by forms of organization, interaction and behavior which have their roots in the historical experiences of their forebears, Western people believe that they organize life in terms of *rational* constructs, derived not from tradition but from scientific investigation of their environments. As they uncover the principles governing their natural and social environments, they gain control of them and are able to manage them to produce the best possible returns for people.

We need to confront this belief.

Do the constructs and understandings of Western Europeans come from their scientific investigation of substantive environments, or is the nature and form of those 'environments' the result of reification of aspects of the natural and social worlds, required by the historical experiences of Western people?

Are the environments with which Western people interact objective features of the world which are recognized as such by all people everywhere, or are they only real to Western Europeans?

In the following historical sketches I suggest that the environments which are recognized are consequences of the historical tensions and confrontations of Western Europe. They are, in fact, understandings which are derived from, and required by, Western historical experience. They are as shaped and determined by 'tradition' as any other system of knowledge and understanding in other communities. The presumption that there are sets of laws waiting to be uncovered for the control of each environment is, equally, a consequence of particular historical experience.

The Western European conviction that they have 'got it right', while others have not, is based in their certainty of the validity of their view of the world, and the effectiveness with which it allows them to manipulate their environments in engaging in forms of activity and organization which are required by Western industrial social templates.

Western communities, no less than any other communities, have *inherited* their understanding of how their world is organized and the ways in which they relate to the environments in which they live.

A key and fundamental difference between Western communities and most other communities lies in the Western presumption of the existence of *separate environments*, each of which operates in terms of its own logic and its own set of operational principles or laws. Before any such sets of laws can even be anticipated, one must recognize the existence of the separate environments to which they relate.

For people not brought up in Western communities, and therefore not thinking in terms of Western presumptions, the existence of the identified environments, let alone the rules for interaction with them, is unlikely to be recognized.

In the same way that Western people take the existence of separate environments as a subconscious given, something which needs no justification, other people take their own understanding of the environment within which they live for granted, together with their understanding of their interaction with it.

When they are required to organize life in terms of Western European understandings, they inevitably warp the organized environments within which they are required to operate towards their own, quite different presumptions about their environment. This effect is most clearly seen in what, for Western people, is the dominant social environment, the economy.

Before I begin an examination of the historical emergence of this Western view of environments governed by systems of law, a few qualifiers are necessary. When investigating historical trends one has to start somewhere. The important primary understandings of any community do not suddenly appear. They are shaped over hundreds of years and through a multitude of interacting variables and circumstances. So, one has somewhat arbitrarily to decide on a starting point in time and on the variables which one will

investigate. What is described in one century will have its roots in preceding centuries.

The influences on community understanding which I highlight are, themselves, modified and focused through a wide range of other variables and circumstances on which I have chosen not to dwell. However, for our purposes here, those issues I investigate do seem to be central to understanding how Western Europeans came to conceive of life as being lived in a number of distinct environments, governed by systems of law, and subject to quantification and evaluation in terms of material returns for individual endeavor.

The 'economic' environment 🐼

Elsewhere I have suggested that many people in non-Western communities make no clear distinction between their 'economic' and their 'social' (or any other) environments ⁴⁹. So, when they engage in 'economic' activity, they, quite naturally, without needing to think about it, integrate their activity with social responsibilities and concerns. This integration produces a very different form of activity from that presumed to be 'economic' by Western people.

Because of this 'confusion' (in Western terms) of environments, the presumptions in terms of which they organize activity are also very different (and they are highly unlikely to have developed detailed sets of economic rules and regulations defining and governing activity and impartially applied across communities ⁵⁰).

Their economic activity does not match that anticipated and required by Western people. They seem to be indulging in 'informal', or even 'illegal', economic activity, that is, activity which falls outside the scope of 'legitimate' economic activity for Western people.

Even when they have attended the West's best teaching institutions, through which the 'necessary' forms of legislation, organization and activity are inculcated, all too often, once back in their home countries, they seem to 'warp' and 'distort' the forms they have learned.

In order to sketch the emergence of primary ideological presumptions underpinning economic organization and activity in Western communities I am going to have to examine the ways in which those presumptions became established in late medieval Europe. As will become clear, the understandings and organizational forms of the period were very different from those of Western communities in the 20th century.

Unfortunately, given the constraints of this discussion, the sketches must necessarily be brief and therefore inadequate. The focus will also have to be limited, bypassing the emergence of particular metaphysical understandings, and the emergence and establishment of the various 'disciplines' for uncovering systems of law operating within the recognized environments.

The development of systems of law 🐼

 (07/03/17)

In the feudal period of the 10th to the 12th centuries, western Europeans saw the world as divided into two domains: a spiritual domain and a secular one, which included political, economic, social and material environments as

now understood in Western communities. These were hierarchically interrelated, with the spiritual domain dominant and the secular domain subject to spiritual oversight and direction.

The spiritual domain was dominated by the Roman Church, with the pope at its head and bishops as representatives of the pope within territorial districts. In their own districts, in all normal matters, bishops took final responsibility, only referring to Rome when something out of the ordinary needed definition, or when they needed support in the face of challenges to their authority.

The Feudal 'Secular Domain' 🐦

The secular domain was the arena within which the Church exercised authority. In the secular domain, feudal princes held political power within hierarchically organized territories. As Maitland has described, feudalism was:

... a state of society in which the main bond is the relation between lord and man, a relation implying on the lord's part protection and defence; on the man's part protection, service and reverence ...

The national organization is a system of these relationships: at the head there stands the king as lord of all, below him are his immediate vassals, or tenants in chief, who again are lords of tenants, who again may be lords of tenants, and so on, down to the lowest possessor of land.

Lastly, as every other court consists of the lord's tenants, so the king's court consists of his tenants in chief, and so far as there is any constitutional control over the king it is exercised by the body of these tenants.

(quoted in Macfarlane 1987, pp. 182-3)

Although Western capitalism depends on a division of the world into private and public arenas, feudal Europe did not require such a division. As Macfarlane, quoting Maitland, says:

The English lawyer Bracton [in the mid-13th century] knew of the distinction of 'private' and 'public', yet 'he makes little use of it. This was because

feudalism ... is a denial of this distinction. Just in so far as the ideal of feudalism is perfectly realized, all that we call public law is merged in private law: jurisdiction is property, office is property, the kingship itself is property; the same word *dominium* has to stand now for *ownership* and now for *lordship*.

(Macfarlane 1987, p. 182)

While the distinction between public and private made little sense in the feudal world, it was during the feudal period that the Western European emphasis on the importance of publicly formulated law, governing private interactions, developed. As Tay and Kamenka explain:

The feudal compact, in keeping with Germanic tradition, was not an act of authority but a voluntary agreement between independent legal persons - one agreeing to serve, the other to provide and protect. It was an enforceable contract which bound the king or lord as much as it bound the subject or leigeman.

In a very important sense, it brought the whole basis of political authority and obedience into the area of private law, of relations between individuals capable, for the purposes of law, of abstract equality and of rationally and freely seeking their individual well-being and subordinating themselves voluntarily. Those not capable of such freedom, e.g. serfs, were not fully legal persons.

(Tay & Kamenka 1983, p. 69)

Although feudal relationships did not require a distinction between public and private realms, the concept of '*free*' *legally defined* individuals entering into *contracts* with one another was born in the feudal period. It became greatly expanded and provided a basis for understanding the nature of the relationship between the individual and society during the 17th century, but it underpinned the development of feudal law.

It also provided one of the rationales for the emergence of a wide range of common-interest groupings during the medieval period. During this period numerous 'associations', 'unions', 'guilds', 'fraternities', 'communities', 'colleges', 'leagues', 'nations' ⁵¹ and other forms of common-interest grouping developed, managed by those who constituted the group and designed for mutual protection and self-help ⁵². Interaction among individuals within these groups was fraternal, with most exchanges being based on cooperation rather than competition.

This form of egalitarian, common-interest grouping is usual in hierarchically organized communities. It allows those who see themselves as being in a similar relationship within a hierarchy to join with others of like mind in promoting and protecting their interests.

As feudal organization became increasingly distorted during the medieval centuries ⁵³, these groups became increasingly important. Amongst the most important were those which brought educated people together to protect their interests against others, and those which emerged amongst the 'money-making' people of western Europe.

Together, these two groups were to challenge and finally displace feudal leaders, and, with their displacement, introduce an entirely different rationale for the organization of society, new forms of interpersonal relationship, and new understandings of the meaning and purpose of life. And, for a variety of reasons, some of which will be sketched here, these forms of reorganization required a very different set of primary ideological presumptions.

Western Europe, over a period of eight hundred years, with enormous difficulty, learned to think in ways which were foreign to people who lived in the feudal communities of the 10th to 13th centuries.

While the sense of legitimate, approved feudal hierarchy within the society was strong, the dominance of hierarchically determined social position over membership of such groupings ensured the subordination of group interests to those of the wider society. Whenever, for whatever reason, the cohesion of the wider society was suspect, these common-interest groupings became more demanding, leading to strikes, riots and other forms of social challenge.

So, in the period when we begin our story, people lived in hierarchically organized communities, with their primary social and political status defined by their relationship to land. Those of similar status within the society recognized egalitarian bonds of common interest, and tended to support

one another and make demands of each other on the basis of their shared identity. But, equally, they recognized those who were hierarchically superior as leaders who both required and deserved their allegiance. In fact, they recognized common-interest association only in terms of these hierarchical responsibilities.

At the base of the hierarchical pyramid of feudal communities were the peasants who, though they held some land, usually held too little to ensure their livelihood. Few peasants could have lived off the land they held within an estate alone. As Ganshof has described for the later medieval period:

... However great its contribution to livelihood, agriculture had by no means altogether displaced the very ancient practices of pastoral life, hunting, and food collecting. By his fields alone the peasant literally could not have lived. All about the area more or less permanently cultivated and, when under crops, held in strict individual or family possession, he required access to immense stretches of common waste left in its natural condition.

These moors and marshes and forests did not merely furnish necessary food for his cattle. His own nourishment depended on them; for wild vegetables and fruits were even more important in his dietary than wild game ...

In villages where there was no lord, or where the lord's power was a late growth, the village community sometimes retained absolute control of these common lands; it owned them, in feudal phrase, *en alleux*... But throughout the greater part of Europe, where common was essential but still only a sort of annexe to the arable, the lord almost always extended his power over commons as well as over fields ...

[However] it is no doubt vain to look for the true medieval 'owner' of the commons.

(Ganshof 1971, pp. 281, 282)⁵⁴

Land was held by families who owed allegiance to those above them who provided not only access to land but also political and other forms of protection and a sense of community to those under their jurisdiction. And a great deal of the land in an area was 'common'; that is, it had no legal owner.

European feudal organization was not based on the need to ascribe individual ownership to all existing land. In this feature, it has a lot in common with many non-Western communities before the imposition of Western forms of organization in the 19th and 20th centuries. When land is not primarily seen as a wealth-creating resource, and people are not primarily geared to the 'wealth-creating' use of their environment, there is no strong compulsion to claim ownership of 'un-owned' land.

The West, as a result of experiences to be sketched here, came strongly to believe in the necessity for all land to be legally and exclusively held by identifiable 'real' or 'artificial' individuals, and used to generate increasing cash income for its owners.⁵⁵

The Feudal 'Spiritual Domain'

The communities in which medieval people lived were serviced by clergy who belonged to a hierarchically organized Church and claimed very important rights and responsibilities within the communities they serviced.

The metaphor which emerged to describe the relation between pope and emperor, between clergy and laity, was that of the soul and the body. The body without the soul is of no consequence. It is the soul which animates the body. Equally, the Church ensured the spiritual life of the secular world. The Church was, therefore, central to life in the medieval world. It therefore claimed authority over the secular world and reinforced its claims with legal statutes based upon written, historical evidence accumulated over the centuries ⁵⁶.

This assumption of the superiority of the soul over the body, of that which is life over that which is a 'container' for that life, was to become significant in the emerging belief in the independence of self-contained, pre-social individuals from the 17th century onwards.

Then, with the material and the spiritual thoroughly separated, a similar separation was to be assumed between human beings and the material environments they controlled. Individuals were to be perceived as separate from and superior to the material world, over which they rightfully exercised dominion. Just as the Church believed it had a mandate from God to direct the medieval world, so Western individuals came to believe that they had a mandate to 'realize the potential' of the resources of the material world wherever they might be found.

The Church's power came from two sources. It held large tracts of land controlled by bishops and abbots who, as feudal lords, had authority in the secular domain, and it was also perceived to hold a very real power to condemn people to hell.

If one could, as the Roman Church after Augustine (354 - 430 AD) claimed (cf. Warfield 1970, p. 122ff), be saved only by belonging to the Church, then to be excommunicated was to be consigned to eternal damnation. In an age when people were convinced of the existence and potency of a spiritual realm, one placed the destiny of one's soul at risk by challenging the Church.

However, there were long periods, particularly following the disintegration of the ninth-century Carolingian empire, when the papacy was politically weak, dominated by local Roman families, and unable to assert its claimed authority.

 (06/10/17)

During the 10th and 11th centuries increasing numbers of the secular rulers of western Europe extended their authority over bishops within their territories. This situation came to a head with the accession of the Duke of Saxony, Otto the Great (912-973), to the German throne in 936. Otto, ostensibly to rescue Pope John XII, conquered Italy and received an imperial coronation from the pope.

As part of his strategy for securing his reign, Otto had made an alliance with the German Church. Bishops and archbishops were given lands and immunity from some of the royal claims on landlords in return for full support of Otto's reign. With the papacy very weak, another way of ensuring support from the ecclesiastical hierarchy was to appoint it (cf. Hayes, Baldwin & Cole 1962, p. 142ff).

The Investiture Conflict 🐦

 (12/03/17)

The situation was similar throughout northern and western Europe during the 10th and 11th centuries. It was brought to a head by Pope Gregory VII in 1075 when he prohibited any form of lay investiture of the clergy. Gregory, calling on legal precedent as established within the Church canons (laws), denied the right of secular leaders to appoint ecclesiastical office holders. He argued that, on the contrary, the pope had the right both to anoint and to depose secular leaders.

Henry IV (1050-1106), King of Germany from 1056 and Holy Roman Emperor from 1084, opposed the decree and called on the pope,

...now not pope, but false monk, [to]... relinquish the Apostolic See which you have arrogated.
(Koenigsberger 1987, p. 166)

The pope responded by excommunicating him, and, faced with resultant challenges to his authority, Henry was forced personally to petition the pope for absolution and reinstatement to his position as emperor.

An entry in the *Encyclopaedia Britannica* (1902) described it:

...There [at the castle of Canossa, where Gregory was residing] occurred the famous scene in which Henry, the highest of secular potentates, stood for three days in the courtyard of the castle, clad in the shirt of a penitent, and entreating to be admitted to the pope's presence. No historical incident has more profoundly impressed the imagination of the Western world. It marked the highest point reached by papal authority, and presents a vivid picture of the awe inspired during the Middle Ages by the supernatural powers supposed to be wielded by the church.
(*Encyclopaedia Britannica* (1902), 10th ed, vol. XXVIII, Henry IV, Holy Roman Emperor (1050-1106))

The pope had demonstrated that he held very real political power within western European territories. Secular leaders, very aware of the way in which Henry had been humiliated, felt a need to counter this power in some way. This confrontation marked the start of growing conflict between the papacy and secular rulers throughout western Europe, a confrontation which has come to be known as the *Investiture Conflict*, which finally climaxed in the 16th century Reformation.

The Roman Church argued that, since kings were established in their kingdoms through the Church's administration of the ritual of Unction ⁵⁷, religious authority was superior to secular authority. As Ullman (1965, p. 86) says, 'It was that act alone which made the king'. The stage was set in the 10th and 11th centuries for mounting conflict between secular and religious leaders. The political history of this period is that of fluctuating but constantly increasing papal fortunes and claims to ascendancy and authority over secular rulers.

The Roman Church underwrote its political dominance through appeals to canon law, established over the centuries, and taking its form from Roman law, defined by the legal works of Justinian, compiled in the sixth century. Such appeals depended on the maintenance of a strong legal framework and of people schooled in interpreting both the canons and the legal prescriptions of Roman law as defined by Justinian.

From the 11th century onwards, as Murray points out,

popes, legates and councils saw the evils of their age as "contempt for the canons". They sought to revive the Church's ancient legal framework, with a few surreptitious accretions (Murray 1978, p. 214).

This revival of the Church's legal framework, coupled with its use as a justification for political claims, led to legal expertise, and the development of legal frameworks, being widely perceived as of great practical importance within both secular and religious spheres. For the Church,⁵⁸

Mankind is ruled by two laws: Natural Law and Custom. Natural Law is that which is contained in the Scriptures and the Gospel. (d'Entreves 1965, p. 33)

Natural law was canonical law; all other law was of suspect quality and should be altered to conform to the canons of the Church. Secular leaders, ruling by custom, should, themselves, be subject to the natural law of the Church. All legal statutes of states and nations should conform to canonical law.

The clash between Henry II, King of England, and Thomas a Becket, Archbishop of Canterbury (1163 - 1170 AD), resulting in Thomas's death, was a product of this conflict:

... when the king had drawn up sixteen "Constitutions", which he said embodied the "Customs of the Realm", the archbishop denounced them as contrary to canon law, and refused to seal them. (Ward 1905, p. 47)

With the Church's legal framework revived and a new stress placed on legal training within the Church, increasing numbers of legally trained scholars passed out of the schools and universities of medieval Europe.

One paradoxical result of the canonical revival and the burst of education which followed it, was that kings could now lay their hands on learned officials. (Murray 1978, p. 217)

What followed, with many slips for kings who were initially forced to rely on scholars who had been dedicated to and trained for the Church, was a burgeoning emphasis on the study of Roman law throughout the late 12th century.

The Need for Written, Centralized, Secular Systems of Law 🦋

The Investiture Conflict underscored a need for secular rulers to have alternative legal frameworks to those employed by the Church. One way to do this was to develop alternative interpretations of Roman law, based on scholarship, countering the interpretations of the Church.

However, if they were to break the shackles of the Church by challenging canonical law, they had, first, to give the concept of 'natural law' a new meaning. It had to be something other than simply 'the laws of the Church'. The study of law had begun in earnest.

William Blackstone would explain this new justification for secular law-making in the 18th century:

... [A]s man depends absolutely upon his maker for every thing, it is necessary that he should in all points conform to his maker's will. This will of his maker is called the law of nature.

(Blackstone, 1765, *Commentaries on the Laws of England*,
Introduction, Section 2 pp. 39-40)

During the following three centuries secular bureaucracies were developed which were firmly anchored in written legal decrees and statutes. If anything was not legally defined, it was suspect. The basis for legitimacy was to be found in *written statutes*.

The Investiture Conflict convinced the people of western Europe of the need for the independent development of centralized, secular legal systems, maintained, refined and applied by state bureaucrats and bureaucracies, with all documentation stored within state archives, to protect and assert the interests of rulers. They needed to be able to beat The Church at its own game.

F. W. Maitland, in a 1902 contribution to the *Encyclopaedia Britannica*, explained it well:

In English jurisprudence 'legal memory' is said to extend as far as, but no further than the coronation of Richard I (3 September 1189). This is a technical doctrine concerning prescriptive rights, but is capable of expressing an important truth.

For the last seven centuries, little more or less, the English law, which is now overshadowing a large share of the earth, has had not only an extremely continuous, but a matchlessly well-attested history, and, moreover, has been the subject matter of rational exposition.

Already in 1194 the daily doings of a tribunal which was controlling and moulding the whole system were being punctually recorded in letters yet legible, and from that time onwards it is rather the enormous bulk than any dearth of available materials that prevents us from tracing the transformation of every old doctrine and the emergence and expansion of every new idea.

If we are content to look no further than the text-books - the books written by lawyers for lawyers - we may read our way backwards to Blackstone (d. 1780), Hale (d. 1676), Coke (d. 1634), Fitzherbert (d. 1538), Littleton (d. 1481), Bracton (d. 1268), Glanvill (d. 1190), until we are in the reign of Henry of Anjou [Henry II], and yet shall perceive that we are always reading of one and the same body of law, though the little body has become great, and the ideas that were few and indefinite have become many and explicit.

Beyond these seven lucid centuries lies a darker period. Nearly six centuries will still divide us from the dooms of Aethelberht (c. 600), and nearly seven from the Lex Salica (c. 500)...

(*Encyclopaedia Britannica*, 10th ed., supplement (1902), vol. XXVIII, pp. 246-53; 11th ed. vol. IX, pp. 600-7.)

As such legal systems became elaborated, they inevitably affected the lives of people throughout Europe. Génicot described some of the effects:

... the local and traditional tribunals were more and more replaced by superior courts run by *doctores* who were not known and whose integrity (not without reason) was suspect, and who practised a new, the Roman, law, rather than the ancient customary one.

The state now advanced a claim, mainly under cover of this *jus*, to the entire ownership of waste, forest and water, and to their exclusive use, or at any rate the right to regulate arbitrarily their utilization. The

villages also had to submit to orders from above and from distant places, and to officials sent from outside ...
(Génicot 1971, p. 701)

As states developed legal systems to protect the interests of rulers against the claims of the Church, those involved in developing statutes extended the legal rights of rulers over more and more of the activities and properties of their subjects.⁵⁹ So, in succeeding centuries, conflict was to develop not only between Church and state, but also between the state and its people. As a result, emphasis was to be placed on the legal rights of individuals within the state against the state itself.

Increasingly, people and state were to become defined in *oppositional* terms.⁶⁰ This change in emphasis was brought to a head in the 17th century in the writings of the Protestant jurist-theologians, chiefly by Hugo Grotius, whose principal work, *On The Law of War and Peace*, appeared in 1625. As Roscoe Pound (1921, pp. 89, 90) put it:

Grotius and those who followed him made reason the measure of all obligation. They conceived that the end for which law exists is to produce conformity to the nature of rational creatures

... at the very time that a victory of the courts in the contests between the common law courts and the Stuart kings had established that there were fundamental common-law rights of Englishmen which Englishmen must maintain in courts and in which courts would secure them even against the king, a juristic theory of fundamental human rights, independent of and running back of all states, which states might secure and ought to secure, but could not alter or abridge, had sprung up independently and was at hand to furnish a scientific explanation when the next century called for one.

By a natural transition, the common-law limitations upon royal authority became natural limitations upon all authority; the common-law rights of Englishmen became the natural rights of man.
(quoted in Grotius 1957, p. xiv)

Increasingly, during the medieval centuries, *customary* obligations and rights between people, not supported by written, legally acceptable documentation, could successfully be challenged by appeal to this developing system of legal statutes.

Of course, the experiences of various western European regions differed. In England there was no 'violent breach between folk-law and jurist law' (Cam 1957, p. 13) as experienced in some other areas of Europe with the establishment of Roman law as the law of the land and the supervision of customary law.

There seems to have been a stronger sense of independence amongst English law makers and practitioners, with the result that, by the reign of Henry VIII, common law had become separated from both Roman law and the canons. As Maitland observes,

Roman law was by this time an unintelligible, outlandish thing, perhaps a good enough law for half-starved Frenchmen. Legal education was no longer academic - the universities had nothing to do with it.
(see Cam 1957, p. 125)

English law had accommodated the 'customs of the realm'. In doing so, it provided rulers with a centralized, bureaucratically developed legal system

which differed widely from the Roman law upon which Church authority and canons were established.

Henry II had set England on a legal course which resulted in an alternative base for legal authority to that used by the pope and by many of the monarchs of Europe. By the reign of Henry VIII, the king was able to appeal to this body of law as legal justification for independence from the Church. Common law had incorporated customary law, and in doing so had become immediately relevant to people at all levels of society.

For the English, to a degree found in few other regions of western Europe, both formal and informal mechanisms of dispute settlement involved attorneys and recourse to courts of law. Justices of the Peace were accessible to all or most members of society, and

...the total impression is that the multitude of overlapping courts and laws penetrated right down to the level of the lowest inhabitants, and that ordinary people had a good working knowledge of the national system of criminal law...
(Macfarlane 1987, p. 74)

and their own legal rights. Macfarlane claims that in Westmoreland, between 1550 and 1720, large numbers of villagers personally initiated complex legal actions against their fellows, which were heard in the central courts of England. 'English society was based on, and integrated by, two principal mechanisms - money and the law'.

The continuing conflict between Church and state in western Europe produced:

- ★ strong emphasis on the development of centralized legal systems spelling out the rights and responsibilities of individuals towards each other and to the state, and greatly expanding the state's powers over its members;
- ★ a growing sense of the need to separate Church and state: each with its own independent set of laws and regulations governing life within the secular and spiritual domains; its own bureaucracy to promulgate and administer legal statutes; and its own set of archives to preserve the documentation upon which the developing systems of law were predicated;
- ★ an expansion of the concept of law to cover an ever-increasing spectrum of daily life;
- ★ a recognized need to separate the rights of the state over its members, and the separate rights of those members, independent of the state;
- ★ and a burgeoning emphasis upon the importance of education.

Education became an alternative avenue to status attainment. Feudal lords became increasingly dependent on educated people to run their bureaucratic machinery, and citizens increasingly needed access to legal expertise to protect themselves from the claims of both the state and fellow citizens.⁶¹ And with this emerging means of status attainment came an increasing emphasis on money income.

Since western Europe in this period was feudally organized, it was inevitable that key positions in the emerging bureaucracies were filled in the feudal manner, through the patronage of the royal household, rather than on the basis of educational training or legal expertise. So, within bureaucracies one had 'political' appointments to key positions, and people employed for their expertise and training under them.

Over succeeding centuries this arrangement was to produce increasing tension between educated 'experts' and feudally appointed principals. By the 17th century this tension had hardened into a strong conviction on the part of the educated (who, by allying themselves with various other protesters of the period, gained increasing power) that principal positions within state bureaucracies and private enterprise should be filled on the basis of educational achievement and demonstrated 'expertise', not on the basis of patronage.

In later years placement on the basis of education was to be regarded as *achieved*; placement on the basis of patronage was to be considered *ascribed*. Of course, feudal appointments were just as 'achieved' as those of the modern period within the capitalist framework; only the kind of activity through which one achieved was very different.⁶²

The Aquinas Solution: Natural Law Distilled from Secular Experience

As seems common at crisis points in western European history, at the time when Church and state confronted each other most directly, a person emerged who provided a philosophical construct from which both Church and state could argue.

Thomas of Aquinas (1225?-1274) was able to focus the debate and provide a logical construct which appeared to sum up and resolve the problem of the relationship between Church and state in the Church's favor. However, it was not long before princes, and those who worked for them, found in Aquinas's construct a justification for a separation of Church and state, each with its own set of laws, and each with its own independent rationale for existence.

Western Europe experienced a growing fascination with the work of Aristotle from the mid-12th century onwards. Aristotle's focus upon categorization of the particular within the sensible world was to result in the re-emergence of a focus on human beings as part of the natural world. As Ullman has suggested:

It was as if a new continent had been discovered - the discovery of man's real nature - and a new subject-matter was revealed. With every justification has it been said that there was a Renaissance, a rebirth of the long-forgotten natural man.

(Ullman 1965, p. 167)

This was a natural man firmly placed in his supernatural context. The medieval fascination with Aristotle received impetus when scholars recognized that he offered a means of defining a new kind of law - *natural law* - law which God had established as the principles through which the natural world was organized and sustained.

This new definition of natural law directly challenged the traditional understanding of natural law as canonical law. It seemed that a confrontation was brewing between Church and state. If Aristotle could be

seen as inspired, as spelling out the natural laws of God in the natural world, then people who sought bases for secular law which were different from those underpinning Church, or supernatural, law could appeal to him.

Aquinas's new model and definition of natural law would provide a way of resolving the looming confrontation. Both were legitimate. The emerging definition of natural law referred to a subset of God's laws, those relating to material existence.

The term 'supernatural' was coined in the 13th century, at the time when there arose a strong need to differentiate clearly between two separate realms (cf. Murray 1978, p. 12). The spiritual realm was governed by spiritual laws, and the natural realm, and people, as creatures within that realm, were governed by natural laws. Human beings within society were governed, or ought to be governed, by laws which reflected those laws of nature.

God makes everything perfect. He had established laws for the governance of the spiritual realm, *canonical law*. He had also established laws for the governance of the secular world, *natural law*. Each set of laws would be found to be self-contained and perfect in its organization and functioning ⁶³.

So, it was the responsibility of people in the secular realm to uncover the *laws of nature*, established by God for the smooth running of the secular realm, just as it was the responsibility of the Church to uncover and apply the laws God had established for the running of the Church and the spiritual realm. So Aquinas argued:

Now in human affairs a thing is said to be just from being right according to the rule of reason. But the first rule of reason is the law of nature ...

Consequently every human law has just so much of the character of law as it is derived from the law of nature. But if in any point it differs from the law of nature, it is no longer a law but a corruption of law. (Aquinas 1952, Pt 1: 2, Q. 95:2)[⁶⁴]

Whereas the Church had defined 'natural law' as a set of rules spelt out in Scripture and Church canons, Aquinas affirmed the validity of the emerging definition of natural law which came from Roman jurisprudence ⁶⁵ and Greek philosophy. To develop legal systems which reflected natural law, it was necessary to understand the 'nature' of human beings.

The claim by Aristotle, that civilization is based on people ordering their lives by instincts implanted in each individual, ⁶⁶ resurfaced in the high Middle Ages. But the definition of those instincts reflected the recognized needs of medieval society. ⁶⁷

In Aquinas's model we have a melding of the concepts of Roman jurisprudence and orthodox theology. The laws of nature should be sought, but, when found, would be discovered to be a coherent, immutable whole. If natural laws could be uncovered by examining the material world, the material world, in turn, would be found to be governed by sets of immutable laws established by God. By conforming to the laws established by God for the optimal performance of his creation, people could reasonably expect burgeoning prosperity. ⁶⁸

Human beings bridged the natural and spiritual realms. Spiritually, they were governed by laws of the spirit, and, naturally, they were governed by laws of nature. As Aquinas put it,

To the natural law belongs everything to which a man is inclined according to his nature.

(Aquinas 1952, Pt 1: 2, Q. 94:4)

An understanding of natural law required comprehension of the nature of human beings, and the nature of human beings could be determined by observing them within their social setting.

Aquinas's construct made Church law 'supernatural law' and laws of the state 'natural law'. According to Aquinas, there were natural laws to which all creation conformed, which were implanted in human beings and in a subservient relationship to divine law. Those who conformed to natural law conformed also to the will of God, as expressed in the natural order.

Natural and divine law were hierarchically related, not opposed to each other. And it was possible for people to live according to the dictates of natural law, with a this-worldly, secular focus to their lives, and yet be living in tune with the will and purpose of God. For the natural world was a law-directed whole, composed of parts which were perfectly placed within the whole through the operation of that law.⁶⁹ So, Aquinas observed:

... natural processes develop from simple to compound things, so much so that the highly developed organism is the completion, integration, and purpose of the elements. Such indeed is the case with any whole in comparison with its parts.

(^œGilby 1960, p. 369)

The natural and supernatural wholes were logically prior to their elements, which only existed as parts of the whole. Without the whole, there is no point or purpose in the existence of its elements. The parts were created because they were necessary to the whole. Individuals did not exist in or for themselves. They only existed as members of a society.

A perfect creation required perfect parts. It was, therefore, the responsibility of all people to live as God had intended they should. Otherwise, they could be held accountable for the trials and troubles visited upon people in this life. And the perfect society was that which, in all its forms and functions, conformed most closely to natural and spiritual law.

Aquinas set western Europe on the search for natural laws governing every area of life in this world. From this time onwards, western Europeans increasingly accepted that if a natural law was discovered, people had a moral and spiritual duty to live by it.

It was this quest which set western Europeans on a path which led to the eventual change from natural laws legitimized by God, to natural laws legitimized by rational logic⁷⁰, a move already prefigured in Aquinas's model. And, finally, as the secularism of the 18th and 19th centuries unfolded, to natural laws legitimized statistically⁷¹. This made the elements primary and the characteristics of the wholes constructed from them determined by the characteristics of the elements⁷².

By the 17th century, although it was still accepted that natural law had been established by God, it was increasingly accepted that any phenomenon in the sensible world could be explained by reference to natural laws. The natural realm was a self-contained, self defining whole. So, one could 'explain' phenomena in the natural world without recourse to the divine. There were no exceptions.

Understanding of natural laws, coupled with rational extrapolation from those laws would provide a full understanding of the possibilities and potential of the natural realm. One could also, by rationally extrapolating from known laws, determine the likely existence and character of associated natural laws.

And all the while, western Europeans became increasingly aware that individuals had a moral duty to 'make the most' of themselves, to fulfill their lives, to 'develop their potential'.

With devout people proving their sincerity and morality through a life focused within this world, the responsibility of each person to strive for perfection through self-development became the prime obligation of life. They had to 'fulfill their potential' - as defined by 17th century 'responsible people'.

It was, equally, and for the same reason, their responsibility to ensure that they realized the potential of the resources placed in their hands. People who misused the 'talents' given to them by God could expect the fate of the indolent servant in Jesus' parable of the talents ⁷³. Richard Baxter, in 1678, spelt this out very clearly:

If God show you a way in which you may lawfully get more than in another way (without wrong to your soul or to any other), if you refuse this and choose the less gainful way, you cross one of the ends of your Calling, and you refuse to be God's steward, and to accept his gifts, and use them for him when he requireth it; you may labor to be rich for God, though not for the flesh and sin.
(1838, p. 377)

Then the greatest of all sins became, as Foucault has eloquently described, the sin of Sloth. To waste the life which God had given, or the resources he had placed in your hands, was not only a sin against oneself; it was a sin against society.

Initially, given the concerns of the age, the focus on natural law was a focus on social organization and activity. Natural was social, and the focus of intellectual inquiry, strongly influenced by the Investiture Conflict, was political.

Within a generation of Aquinas's teaching, those who had been seeking legal and philosophical foundations for the independent rights of kings from popes succeeded in separating natural law from canonical law and arguing for their entirely independent legitimacy and efficacy.

God had created separate, self-consistent, natural and supernatural worlds, each with its own set of laws defining the correct interrelations among the parts. It was in the interests of civil powers to insist on, and to provide philosophical justification for, the entirely separate development and efficacy of civil law. ⁷⁴

Over succeeding centuries this process was to produce recognition of a whole range of separately existing bodies of law relating to specific areas of the natural realm. Western Europe became convinced of the importance of written law as sets of basic principles through which elements in any whole could be perfected and combined and through which the whole gained its identity. To control the natural world, one needed to discover the sets of laws for such control. Knowledge of laws was power.

The search for systems of laws defining the correct interrelations among parts of logically constructed wholes had begun in earnest. And, because in the medieval world all law was enshrined within a guardian bureaucracy, the search for laws assumed such bureaucratic underpinning. Where a body of laws was uncovered there should be a bureaucratic body to safeguard, preserve and apply those laws.⁷⁵

By the end of the 12th century western Europeans were already becoming aware of the potential political value of an understanding of the natural world. Alexander Neckham (1157-1217) claimed that when

the subtle truths that lurk in the very bosom of nature' had been uncovered, 'what enemies could withstand the kingdom that was able to triumph over [i.e. master] the sciences?'
(quoted in Murray 1978, p. 124).

With Aquinas's new interpretation of 'natural law', Western Europe quickly came to believe that, by uncovering the laws for the organization of the material environment, people could gain power to manipulate it in their own interests.

From the outset the recognized importance of establishing secular law as an independent, self-contained system was based on a pragmatic determination to use it in establishing secular independence, empowering the state. Knowledge of laws, and the ability to manipulate them, was power. The search for natural laws was, from the outset, accompanied by a belief that those who found them and learned to master them empowered people to exploit to the full the domains or environments governed by them.

During the later medieval period people became increasingly aware of both religious and secular corruption, as those with access to legal expertise used their power to disinherit those who had no access to it.

People felt less constrained by social obligation as hierarchical relationships became challenged with the growing abuse of power and authority in the medieval world. They therefore felt free to pursue private gain without the need for social justification. In fact, if one could gain an advantage through appeal to law, one could claim 'legitimacy' in making the most of that advantage.

Over succeeding centuries people increasingly learned to manipulate legal statutes to increase their private wealth, accepting fewer and fewer social responsibilities which were not required by written law. By the 17th century, people were able to challenge many of the customary responsibilities of earlier centuries in this way. Joseph Lee, a succinct spokesman for the cause of enclosure and independence espoused by new landowners in that century, could say:

Let it be granted that our land and businesse lying nearer together fewer servants will be kept; are any bound to keep more servants than are needful for their businesse; or may they not cast how to do the same businesse with least labor ... Is a man bound to keep servants to pill strawes or labor in vain? By what law? ...
(quoted in Appleby 1978, p. 61)⁷⁶

'Money-making' patron-client networks and an emerging emphasis on quantification 🐦

Prior to the 13th century, merchants were constantly on the move in an unending pursuit of profit. They were fringe dwellers, outside normal society, who challenged many of the central moral presumptions of the feudal period and were regarded with suspicion by upright citizens ⁷⁷. In an endeavor to contain them and yet, at the same time, attract them to establish their bases in their territories, states established rules and regulations both governing their activities and defining the necessary obligations of people who interacted with them.

They formed a common-interest group who regulated their affairs amongst themselves on the basis of cooperative rather than competitive exchange. Because of their exclusion from feudal society, they formed parallel, informal networks of patron-client relationships among themselves. Over time, there emerged an informal ranking of the 'money makers' of western Europe and an intermeshing of their interests. They then used their wealth and collective power increasingly to subvert the feudal system. (Eight hundred years later, financial deregulation and 'globalization' of capitalism are similarly [subverting national sovereignty and Democracy](#).)

By the 13th century the relationship between feudal leaders and the wealth holders of western Europe was increasingly based on transfers of wealth in return for feudal position. ⁷⁸ Those who gained wealth were able, from the outset, to use it to purchase position and recognition within feudal society. As they increasingly gained the upper hand, they were finally, in many regions of western Europe, to displace the feudal hierarchies with their own, alternative networks based on patron-client relationships.

Of course, as they gained political power, they increasingly influenced the exercise of government and the formation and implementation of law. By the 17th century, the foundations had been laid for the transformation of feudal structures into those which we now realize are required by capitalism.

The intermeshed patron-client networks of those engaged in wealth-accumulating activities remained important throughout Western Europe during the succeeding seven hundred years. Muldrew (1993: 163) has shown that during the early modern period, those who identified each other as engaged in similar activity within the marketplace 'stressed credit relations, trust, obligation and contracts' amongst themselves rather than unbridled individualistic profit making. They acted as common-interest groupings within patron-client networks.

Western European merchants travelled throughout the Mediterranean, into Egypt, through central Asia, and throughout western and northern Europe. They were not scholars. They were morally suspect adventurers, willing to incorporate any ideas or practices which might increase the profitability of their ventures.

Above all, what they needed was a clear, simple method of accounting and calculation. During their travels they encountered Muslim traders, who had gained a new form of calculation from northern India, based on the abacus. The abacus required a base-ten number calculation system which employed the zero to retain all place columns throughout calculation. Traders who accepted this new system gained great advantages in bargaining and exchange.

The ponderous Roman numbering system, enshrined in the literary, legal and political worlds, was cumbersome, made any attempts at either multiplication or division extremely complex, and was inappropriate to the

use of the abacus. It was, however, for a variety of reasons, strongly supported by scholars.

Scholars, remaining wedded to the Roman system, had great difficulty in mastering the principles of the new mathematics - principles which required the use of the zero as a place holder. This produced a clear divergence between money makers and scholars, with the money makers of Europe gaining increasingly independent control over financial matters as their expertise outstripped that of people tied to the use of the Roman numbering system.

The new mathematics of the late medieval period was important in driving a wedge between scholarship and practical bookkeeping which has been reflected in the Western separation of the humanities from the sciences and commerce, ever since. It was also to mark the beginning of a developing interest in numeracy as a prime means of expressing the quantitative evaluation of individuals and groups (required by the emerging 'modern' social template which needed means for comparing the material worth of individuals).

While scholars depended on the existence of feudal society for their success, since scholarship was a means of upward mobility, merchants gained greater freedom of activity as feudal society weakened.

These developments occurred at the time when secular rulers were seeking increased independence from religious domination and were looking for people with the necessary skills to help them to become truly independent. High on the list of those who were most valued were those who had developed successful mercantile ventures. They were able to support secular rulers financially and to provide the kinds of skills necessary for the more efficient development of taxation and other forms of revenue earning and accounting. As Murray claims,

Authorities needed arithmetic because they, like merchants, had counting houses.
(Murray 1978, p. 195)

In western European capitals the expansion of legal bureaucracy was paralleled by the expansion of fiscal bureaucracies, and an area of law emerged, focusing on commercial activity.

By the reign of Henry II the English administration of finances was already being formally systematized, with its own sets of laws and regulations. This organization was spelt out in a descriptive handbook entitled the *Dialogue of the Exchequer*.

Similar developments occurred in both France and Germany, while in Italy a range of very sophisticated commercial techniques were developed, supported by handbooks of commercial practice. Those from the rest of Europe who wished to master the intricacies of double entry bookkeeping or buying and selling on credit travelled to Italy, where they were able either to enter employment in established business firms or to study the new methods of accounting and banking at schools and universities.

Regionally based administrations became stronger as the hierarchical interrelationships of feudalism weakened. They also became more formally organized and economically viable as the political structures supported by the administrations increased in stability.

The development of legal and fiscal institutions provided a base for bureaucratic government which had not existed in medieval feudal Europe. Over time, a rationale for government emerged which was different from that of feudalism, based on control of legal and fiscal bureaucracies and systems of law rather than on the personal allegiances of land holders.⁷⁹

Autonomy and systems of law 🦋

Through the later medieval period, towns arose as centers of commerce and trade. Europe was being reorganized to serve the patron-client interests of increasingly politically dominant 'money-makers'. This provided people (who were being displaced by the subversion of feudalism to serve money-making interests) with new means of livelihood. Merchants needed bases, markets, merchandise and security. They were to find all these in the newly forming urban areas.

As trade increased, the need for artisans grew to provide the merchandise for trading. Towns, gaining their prosperity from trading, consciously provided support to their traders and encouragement to merchants to relocate to their districts. Rural dwellers from estates near towns gravitated to them and became involved in the production of goods or in the provision of various services to other urban dwellers.

Most larger towns managed to distance themselves from feudal lords and laws, developing their own sets of laws and bureaucracies to administer them. The legal statutes of towns spelt out the rights and responsibilities of citizens, the legal relationships between towns and rural land holders, and the 'freedom' of citizens from the claims of rural lords and statutes.

In most towns there was a gradual evolution towards equality before the law and this equality came to be extended to unfree persons who settled in towns. "Town air makes free" became an important principle in medieval law.

(Koenigsberger 1987, p. 146)

In most towns of western Europe it became accepted that residence for a year and a day set serfs free from their obligations to the estate owners under whom they formerly served. In the minds of the inhabitants of western European towns, freedom and 'progress' became closely associated. Equally, rural laboring, servitude and domination by 'tradition' became conflated. For a laborer to better himself, he should do what the fabled Dick Whittington did in ^{oe}[the folktale](#) - go to town to seek his fortune⁸⁰.

Since urban areas became identified with freedom from servitude and increased material wealth, and towns emphasized the importance of merchant activity, the merchant, from the mid-13th century onwards, slowly emerged as more of a hero than a rogue. In the minds of western Europeans, country life became equated with serfdom and tradition, town life with freedom and self-improvement.⁸¹

As Hertz observed,

the feudal disintegration of the central government .., gave many towns the opportunity of winning an almost republican independence. (Hertz 1972, p. 57)

Where any region, however small in territorial extent, could successfully establish and maintain autonomous legal and fiscal bureaucracies for the government of the people, it could claim autonomy on the basis of the

existence of these structures. The state became identified with control of bureaucracies which applied systems of laws and regulations. Those who controlled the bureaucracies controlled the state. Any territory which could successfully establish such bureaucracies and legal systems could claim autonomy.

The weakening of feudal institutions resulted in a range of demands on kings as pressures for self-government of regions within their territories mounted. Not only were regions within kingdoms claiming limited autonomy, they were also insistently demanding the limitation of legal prerogatives of the Crown.

While the Magna Carta was an unusually sweeping charter, similar limitations on the rights of rulers were being negotiated throughout western Europe.

Nearly everywhere in Europe kings acceded to such demands for the sake of peace at home and support for their foreign wars ...
Everywhere rulers granted charters to cities in their territories, allowing them varying degrees of self-government.
(Koenigsberger 1987, p. 233)

The separation of states and commerce 🦋

During the 13th and 14th centuries there arose, in western Europe, as in England, groups of well-to-do merchants, wealthy professionals and rural property holders. Either through direct purchase or through the judicious use of credit, they were able to gain control over increasing areas of land. Over time they developed into a country gentry with resources of their own on which they might call.

Landlords, where they claimed power over common lands, could see in them sources of revenue through sale which would in no way diminish the size of their domains. They increasingly claimed title to these lands and sold them to the highest bidders. Rural small holders, who required access to common land in order to supplement the inadequate returns from their holdings, found their access being denied, and increasing numbers were forced from their lands.

From personalized, cooperative hierarchical relationships to object-oriented, competitive oppositional relationships 🦋

One could no longer, in the later medieval centuries, speak of any simplistic division of rural society into lords and peasants. Rather, there were some large landlords who controlled estates of considerable extent, with large numbers of resident villeins, and there were landowners with very small holdings, working for themselves and eking out a living which was little different from that of the feudal villein.

Between these extremes there was a large group of landlords who controlled estates of varying size, with varying numbers of dependent land holders, and with varying degrees of acceptability by those tenants.

Not only were there large and small property holders, there was also a growing number of property holders whose wealth came from commercial activity and who had strong links with towns. These land holders were 'owners' rather than holders. They had not acquired rights to property through feudal favor but through purchase.⁸² They therefore felt under less

obligation to accept feudal responsibilities, either towards those who were hierarchically superior or towards those inferior to themselves.

Most lived in the country but conducted their business activities in towns. Gaining status from their rural addresses and wealth from their town pursuits, they were in a position to play one off against the other to their own advantage. In the process they became defined as separate from both town and country, an independent group who became increasingly aware that they could, by manipulating various systems of law, gain an advantage for themselves.

This group, in succeeding centuries, became identified as a common-interest group, an incipient 'class' with interests of their own which they should pursue.⁸³ Their success in manipulating legal statutes to their own advantage made them a major force in western Europe and provided a class of 'owners', 'employers' and 'directors' as the emerging economic concerns of Europe became increasingly dominant.

Acting as the 'unions' and 'nations' of medieval Europe had acted, those who identified with the 'country gentry' saw themselves as having common interests, as sharing cooperative relationships with each other against opposing groups - the workers, the poor, the Crown, the 'idle rich'.

There was also a constantly expanding population of itinerant laborers who had lost access to land, or whose lands, without access to common land, were inadequate to meet their needs⁸⁴. They moved with the crops and seasons, employed, as needed, by land holders. They were coming to understand the world in terms which directly reflect the experience of those employed by others. As Thompson argues:

Those who are employed experience a distinction between their employer's time and their 'own' time. And the employer must *use* the time of his labor, and see that it is not wasted: not the task but the value of time when reduced to money is dominant. Time is now currency: it is not passed but spent.
(Thompson 1967, p. 61)

The relationship between the growing population of employed people and those who employed them was being transformed from one of hierarchical responsibility into one based on wage labor, with employers and employed, landowners and tenants being increasingly seen as opposed groups.

With decreasing populations in the later 14th and early 15th centuries, and opportunities abounding for material advancement for those who wished it, the emphasis on material returns for labor input greatly increased:

The Black Death ... brought a sense of urgency, especially in urban areas. The work day was extended and night work became common as merchants sought greater profits and workers, higher wages ...

Clocks and the rhythmic chimes of bells became more important than ever ...

By the end of the century, 'merchant's time', rather than 'the traditional conception of time in Christian theology', became the rule.
(Gottfried 1983, p. 81)⁸⁵

In the process, there developed a need for the determination of starting and finishing times in work.⁸⁶ It became a common practice, perpetuated over several hundred years, for early morning and curfew bells to be sounded to alert people to the start and end of the working day.

As one, by-lined P.Q., wrote in an item in the February 17th, 1838 edition of *The Mirror* : in 1644, Richard Palmer of Workingham had left a bequest to the town ensuring that in future the great bell of the Workingham Church was to be rung for half an hour daily at 4am and again at 8pm:

... that as many as might live within the sound might be thereby induced to a timely going to rest in the evening, and early arising in the morning to the labors and duties of their several callings, (things ordinarily attended and rewarded with thrift and proficiency)
... the same being done in most of the cities and market towns, and many other places in the kingdom.
(^œ*The Mirror* No. 879, 17th February, 1838, p. 98)

During this period of feudal decay the peasants of Europe, in the words of Blum, threw off:

... the bonds that held them in serfdom. Nonetheless, they still owed servile obligations to seigniors, and they were still subject, to a greater or lesser extent depending on the locality, to the jurisdiction and punitive authority of seigniors.

Some historians have made much of the fact that the dependence or servility of these peasants was not attached to their persons (as it was to the person of a serf). Rather, they argue that the dependence adhered to the land. It became part of the price the peasant paid for the use of his holding to the seignior who had the superior ownership of the land.
(Blum 1978, p. 33)

This progressive transference of rights and responsibilities from person - person *hierarchical* relationships⁸⁷ to person - property - person *oppositional* relationships, often confused and ambiguous during the 14th to 16th centuries in western Europe (and during the 17th to 19th centuries in much of eastern Europe), removed direct responsibility for the welfare of tenants from landlords and resulted in an increasing sense of alienation.

Landlords were increasingly able to demand servility as a cost to the tenant, and the land holder or rural laborer increasingly objectified such costs as the *price* of the land or of employment. This social distancing of rural poor and landlord distorted recognized social relationships, emphasizing the *differences* and decreasing the recognized *commonalities* between them. *Cooperative, interdependent* relationships were being displaced by *oppositional, independent* relationships, mediated through legal statutes governing the ownership and use of property.

During the 19th century Marx was to comment on these developments, arguing that, over time, the dependence of the serf on the lord of the manor became increasingly transformed into apparent independence with the individual 'hemmed in on all sides by material relations' (Fischer & Marek 1973, p. 57). Increasingly, the rights and responsibilities of individuals to each other became *legally spelt out* and *materially measurable*, objectified. These obligations could then be traded in the same way as other objects.

That is, the rights and responsibilities implicit in social relations could be treated as rewards and costs and the potential labor input of the obligation could be evaluated against labor inputs into commodities. One could calculate the money worth of social obligations. This development did not do away with the obligations; it only made the individual who owed them

appear to be independent of those to whom the obligations were owed. As Marx perceptively observed of the production of commodities:

... it is a definite social relation between men, that assumes, in their eyes, the fantastic form of a relation between things ...

This I call the Fetishism which attaches itself to the products of labor, so soon as they are produced as commodities, and which is therefore inseparable from the production of commodities.

(Marx 1887, p. 43)

Since the obligations were costs attached to the land worked by the tenant, the tenant could be seen as independent of the landlord to whom the obligations were owed. Previously hierarchical obligations and responsibilities were transformed into 'terms of rent' and attached to the property rather than to the people involved.

A social relation between individuals had assumed 'in their eyes, the fantastic form of a relation between things'. The focus of Europeans was being fixed on the *legal obligations* and *quantifiable costs* of social interaction, attached to or incorporated into the *object* of any exchange, rather than the persons involved in the interaction.⁸⁸

Increasingly, over succeeding centuries, people were to see all social relationships in terms of costs and rewards within a legalized framework of obligations and rights. What was *gained* and what was *lost* through social interaction became the determinants of social exchange.

The focus of interaction was on the *products* rather than the *participants*. One could now aim to minimize costs and maximize personal gains with less and less consideration of social responsibilities not spelt out in legislation. Social relationships were being reduced in form to commercial transactions.⁸⁹

The alienation of property and stress on legally bounded confrontation 🔍

The focus of life was increasingly on the gains and losses of interactions. This competitive calculation of costs and rewards was coupled with an emerging belief in the morality of 'realizing the potential' of one's resources; and with burgeoning possibilities of both attaining and enhancing status by accumulating wealth with which to purchase estates.

Business people and country gentry therefore saw it as more and more important to use their assets to generate increased wealth. In order for landlords to increase their personal incomes from their holdings it was necessary to rationalize land holding and land use practices.

This focus on reducing costs and increasing profits resulted in permanent reductions in the number of people living off the land, the consolidation of land holdings, and increasing farm size, together with alterations in land use practices. In turn, these developments could only lead to increasing tension between landlords and tenants and increasing alienation (see [16th Century Land Alienation](#) for a contemporary account of this alienation).

During the 15th century, as population increased again, increasing numbers of rural dwellers were displaced from their holdings. The number of itinerant laborers moving with the seasons, crops and availability of work escalated, and towns' populations rapidly expanded.

Increasingly, it became a fact of life that the person without an *inalienable legally recognized right* to property was at the mercy of those who controlled the means of livelihood. Any person who was *materially or socially dependent* on another gave that person material power over him or her. One needed to *own property* (that is, have written, legal entitlement to exclusive possession) in order to maintain social and material independence.

The small holders and laborers of western Europe were forced, by bitter experience, to re-evaluate their relationship to feudal hierarchies and find alternative bases for social and economic security. The natural direction in which this took them was towards the *personal legal ownership* of land and other means of livelihood, with all the rights and responsibilities of ownership spelt out in legislation and attached to the property.

Using Law to Rob the Poor and Dispossess the Weak 🐼

Europe was passing through a period of profound political, social, religious and intellectual change. And, as with all such fundamental change, affecting and being affected by alterations in the primary presumptions of thought and organization, people became less and less sure of themselves and those around them.

From the 15th century onwards, as Foucault so graphically describes,

...the face of madness has haunted the imagination of Western man.
(Foucault 1971, pp. 15) ⁹⁰

Nothing made any sense.

A contemporary comment from the 1350s paints a graphic picture:

justice and pity were powerless, so soon as it appeared advantageous to murder or poison rivals in power at the hospitable board. The science of finance was reduced to robbery, politics to perjury ...
(quoted in Nohl 1961, p. 96)

The miracle play of Theophil included sentiments which summed up the mood of the age:

O Thou thoroughly wicked God, if I could but lay hands on Thee! Truly I would tear Thee to pieces. I deny Thee, deny Thy faith and Thy power. I will go to the Orient, turn Mussulman, and live according to the law of Mahomet. He is a fool who puts his trust in Thee!
(quoted in Nohl 1961, p. 97)

People seemed able to apply the laws, established by God for the more perfect organization and functioning of society, to personal gain, to robbing the poor, to dispossessing the weak, to denying long-established social responsibilities. And the justifications they gave for their actions did not make sense in terms of the understandings of the feudal world.

While their actions could be justified by law, they contravened all the sensibilities of medieval people. They had long assumed that society was organized in terms of complementary, cooperative hierarchies, with the hierarchically superior taking responsibility for the welfare of those under their protection.

With the fundamental assumptions of communities in a state of change and disarray, people found it difficult to keep control of reality. There were too many conflicting and contradictory understandings of life, and it was

increasingly difficult to know who or what to believe. Europeans became increasingly aware, and fearful, of the effects of madness, of people whose view of the world did not 'make sense', who flirted with 'forbidden wisdom'. As Foucault says:

What does it presage, this wisdom of fools? Doubtless, since it is a forbidden wisdom, it presages both the reign of Satan and the end of the world ...

Apocalyptic dreams are not new, it is true, in the 15th century; they are, however, very different in nature from what they had been earlier. The delicately fantastic iconography of the 14th century ... where the order of God and its imminent victory are always apparent, gives way to a vision of the world where all wisdom is annihilated ...

Victory is neither God's nor the Devil's: it belongs to Madness ... On all sides, madness fascinates man.

(Foucault 1971, pp. 22,23)

During this period the movement towards the enclosure of common land and the rationalization of land holding and land use produced severe social distortions. As Polanyi has described:

Enclosures have appropriately been called a revolution of the rich against the poor. The lords and nobles were upsetting the social order, breaking down ancient law and custom, sometimes by means of violence, often by pressure and intimidation. They were literally robbing the poor of their share in the common, tearing down the houses which by the hitherto unbreakable force of custom, the poor had long regarded as theirs and their heirs'.

The fabric of society was being disrupted, desolate villages and the ruins of human dwellings testified to the fierceness with which the revolution raged, endangering the defences of the country, wasting its towns, decimating its population, turning its overburdened soil into dust, harassing its people and turning them from decent husbandmen into a mob of beggars and thieves.

(Polanyi 1957, p. 35)

Monarchies of the Reformation period, increasingly despotic, looked for support from the common population against an increasingly independent rural gentry who were challenging feudal responsibilities and insisting on the logic of what we now call 'economic rationality'. As Polanyi claims, the Tudors and Stuarts of England used the power of central government to relieve the victims of this transformation in property rights and, in the process, gained the increasingly vociferous opposition of those who stood to benefit from enclosure, the rural gentry.

The monarchies of western Europe and their bureaucracies were essentially feudal, not business-oriented. Political power in the 16th century still rested with hierarchies whose positions were legitimized by their relationship to the Crown, not by their control of material resources.

The 'money-making' gentry and the feudally oriented political hierarchies of Europe were increasingly seeing their interests in *oppositional* rather than *hierarchical* terms. This confrontation produced an expansion and elaboration of the centralized legal system, developed through preceding centuries, to incorporate rules and regulations governing relationships between state and rural gentry and commercial interests. Another

elaboration spelt out the relationships between landowners and tenants and between employers and employees.

The state, through its legal bureaucracies, became an intermediary between tenant and landowner, between employer and employee. Legal systems therefore became more detailed, spelling out the rights and obligations between subjects as well as those between subjects and princes.

Blum (1978, p. 60ff) has succinctly spelled out the consequences of this movement for peasants and seigniors on the European continent. Over time the obligations of tenant and landowner, employer and employee, became standardized, with labor commitment, tithe of produce, and cash payments becoming increasingly objectified by statute. Peasants or workers - who dared - could appeal to the courts if they considered themselves unfairly treated.

In England the scene was a little different. During the 15th century legal developments resulted in the spelling out of a comprehensive law of *contract*. According to Maitland, the bonds of family settlements through which land had been tied up within kin groups were loosened, so that each inheritor gained alienable title, and villein tenure was converted into the secure copyhold tenure of modern times (see Cam 1957, p. 126).

This removal of responsibility for the tenant's welfare from landlord to state, from the feudal *person - person hierarchical relationship* of the lord and tenant, to a *person - state bureaucracy - person oppositional* relationship profoundly affected medieval understandings of the world. It was part of a general movement towards the interpolation of a non-personal, apparently objective legal framework in terms of which interpersonal relationships (increasingly being identified as a body of interactions relating to a particular 'environment' - the economic) could be assessed and limited.

As the rights and responsibilities of interactants were legally objectified, knowledge of the law became a means of maximizing profits. One needed to know the statutes. Prest explained it well:

the Elizabethan and early Stuart gentry learnt their law ... from the various manuals and texts designed specifically to meet the needs of landlords and J. P.s.
(Prest 1967, p. 21)

Strong emphasis was placed on legal knowledge as a means of protecting one's interests against opposing groups.

Inns of Court, the principal legal schools of the period in England,

attracted two classes of students: those who sought to become lawyers, and those whose parents "do not desire them to be trained in the science of the laws, or to live by its practice, but only by their patrimonies".
(Prest 1967, p. 22)

Those who owned estates needed to know the law in relation to estate ownership. The Inns of Court had become 'the nurserie of the greater part of the gentry of the realme' (Prest 1967, p. 22).

While the poor had to hire the services of lawyers - whose fees, as we have already seen, were considered exorbitant - the gentry were being trained to defend their legal rights to property. Legal power was on the side of landlords and employers. And they were being trained to view relationships as based on legal definition and confrontation.

The 'modern' world would be one in which people identified themselves in terms of classes, hierarchically ranked through their former statuses within feudal society, with the 'higher' having access to legal expertise not available to the 'lower', and considering themselves the 'natural' directors of 'lower' classes. Society was becoming divided into *competing* common-interest groups, into embryonic classes, whose confrontations would be framed by state legislation.⁹¹

Private ownership, consumption and accumulation 🐞

As previously feudal relationships became legally objectified, the possibility of making demands of tenants and rural laborers without considering them as people became increasingly conceivable. With landlords and employers decreasingly needing to confront tenants and employees as persons with whom they shared direct social relationships, it became possible to whittle away the rights of the poor.

Jurists steadily reduced the tenants' right of freedom and movement; allowed landlords to raise their demands for labor service beyond long-accepted norms; and steadily weakened the security that attached to customary rural tenures. And employers successfully argued for state legislation compelling the poor to work.

This attenuation of recognized social obligation deepened the emphasis on freeholding and private enterprise so that, by the 16th century, as Christopher Hill observed,

when the business man of ... Geneva, Amsterdam or London looked into his inmost heart, he found that God had planted there a deep respect for the principle of private property.
(Hill 1966, p. 46)

Increasingly, to ensure social and physical well-being, people had to own what they needed. This requirement placed mounting demands on production, fuelling a growth in commodity output.

Demonstrating to others that one was materially independent or self-sufficient gave one increased status and prestige. It became increasingly 'obvious' that property *should* be privately owned, and that such ownership was ownership of the thing itself, not merely of socially approved rights to its use. The principle of private property was undeniably a *natural law* principle. Those who could demonstrate such ownership, demonstrated their moral and therefore social worth.

During the 16th century in much of western Europe (and a century or two later in most eastern areas), as Blum argues:

... monarchs had managed to divest the nobility of much of its political power as a corporate entity. Yet the nobles not only continued but were strengthened in their social position and in their claim to special privilege, and they retained and broadened their claim to the land, labor, dues, and subservience of the peasantry.
(Blum 1978, p. 197)

Monarchies managed to secure their own political positions and emasculate the political authority of the nobility and powerful landowners by granting legally sanctioned privilege to them at the expense of the poor.

The reduction of political responsibilities and the reaffirmation of legal and economic entitlements led in turn to the development of absentee landlords.

They left their estates in the hands of managers and lived in an increasingly profligate manner. This required excessive borrowing, often against either the future production of estates or the value of the estate itself. As McCracken described:

In the last quarter of the 16th century, a spectacular consumer boom occurred. The noblemen of Elizabethan England began to spend with a new enthusiasm, on a new scale. In the process they dramatically transformed their world of goods and the nature of Western consumption ...

They changed their patterns of hospitality as well, vastly inflating its ceremonial character and costs. Elizabethan noblemen entertained one another, their subordinates, and, occasionally, their monarch at ruinous expense.

(McCracken 1988, p.11)

This situation was tailor-made for the mercantile capitalists of the 15th and 16th centuries. Having inherited the entrepreneurial skills and the structures of medieval capitalism and mobile capital, they were able to relocate their enterprises and take advantage of the profligacy of nobility to accumulate sizeable fortunes. Yet, once having accumulated their fortunes and having purchased the rundown estates of those whose profligacy had been their undoing, they found themselves expected to live in the same extravagant manner.

There developed a tension between increasing consumption and conserving one's gains for further expansion of one's holding which required increased stress on the material productivity of estates. As Mukerji says:

... the hedonistic culture of mass consumption was probably as crucial in shaping early patterns of capital development in Europe as the asceticism usually associated with this era. Hedonism was to consumers what asceticism was to entrepreneurs: it provided the cultural rationale for increased interest and participation in economic activities.

(Mukerji 1983, p. 2)

The new emphasis on conspicuous consumption coincided with a strong expansion in commodity output, which provided burgeoning incomes to those who controlled commerce. In a period of rapid economic expansion, entrepreneurs could both indulge in the hedonistic consumerism of the age and greatly expand their mercantile interests, funded by the new wealth.

The rise of Antwerp as the financial capital of Europe in the late 15th and early 16th century coincided with the opening up of the Portuguese spice trade and the conquest of the Americas by Spain. These developments stimulated entrepreneurial activities throughout most of western Europe and further fuelled the growth of commercial activity. Western Europe entered into a prolonged economic boom which coincided with the growing emphases on conspicuous consumption, material independence, and the use of holdings to generate increasing surpluses.

This was an age of merchant houses, acting across territorial boundaries and developing their own sense of identity as semi-independent political, as well as economic, enterprises.⁹² Princes, seeing in the granting of monopolies to merchant houses another way of raising revenue and of tying merchant houses into the political structure, granted to them exclusive rights to trade in certain goods. Joyce Appleby described the process:

... the king had long had the power to grant monopolies, which took the form of issuing licenses for the exclusive public control of a product, a trade, or even a government service like the inspection of tobacco. James found the granting of monopolies a particularly facile way of increasing his income.

A typical Englishman, as Christopher Hill noted, lived 'in a house built with monopoly bricks ... heated by monopoly coal ... His clothes were held up by monopoly belts, monopoly buttons, monopoly pins ... he ate monopoly butter, monopoly currants, monopoly red herrings, monopoly salmon, monopoly lobsters' ...

With the growth of both the internal and external markets, monopolies distorted the whole pattern of trade.

(Appleby 1978, p. 33)

What started out as being to the advantage of mercantile entrepreneurs became another means of revenue collection, a further drain on business houses which already saw themselves as separate from, and using, the state in which they operated. As Appleby pointed out, increasing numbers of traders, who found their activities severely curtailed by monopolies, began insisting that the right to *free trade* (that is, the abolition of state controls on production and sale) was a basic human right, a *natural law* right which, since Aquinas, made it a legally required right.

Over a period of more than a century the money makers of western Europe came to oppose the granting of monopolies. They argued increasingly forcefully for the separation of political and economic activity and increased autonomy for merchant houses to act on their own, in their own interests without government prohibitions.

Free trade was to imply not only the right of traders to trade, but also the reduction of government restrictions on trade. Traders should not be subject to political or social restrictions on their activities. Rather, laws and regulations should be passed which guaranteed individuals and businesses freedom to pursue their own independent interests without interference from the state.

Increasingly, what we now unhesitatingly define as *economic concerns* became distinguished from the political and social concerns of the period, the province of a common-interest grouping which included country gentry, traders, merchants, financiers and manufacturers. They demanded greater *autonomy*, and government interests demanded greater *control* of this newly emerging environment.

The role of government was being redefined by this common-interest group as the provision of a secure fiscal, legal and social background to commercial activity, not the regulation of business. Business should operate under its own laws and regulations, those which applied to the economic world.

By arguing for the existence of a separate environment, a realm which was governed by its own internal principles and logic, those who saw themselves as operating within that environment could advocate its independence from state control. It should conform to its own laws. And such laws would necessarily facilitate business activity, providing a dependable set of rules governing business transactions which would ensure the consistency of economic decisions and planning. Inevitably, those rules and regulations reflected the emerging relationships of the period.

Many members of this business-oriented group looked with some contempt on those whose self-indulgence led to the dissipation of their inherited wealth.⁹³ It was clearly not in their interests to support monarchical regimes of similar temper which saw them as sources of ready income through taxation. Most either applied pressure on regimes for reform of business regulation and control or moved their centers of operation to areas where such reform was already occurring.

The Renaissance state of the 16th century supported bureaucracies which, from the 20th century perspective, would be considered very corrupt. No clear distinction was made between the office and the office holder, and the expenses of office were not clearly distinguished from those unconnected with the office.

The rulers of western Europe were not business people; they were traditional rulers, supported by a nobility which was feudally justified. While the emerging nations of Europe supported bureaucracies, those bureaucracies were organized in ways which facilitated patron-client access to the wealth, information and influence which they focused. The personalized bureaucracies of patron-client states are organized and operate on very different principles from those of Western industrialized states.

Bureaucratic posts were tied into the traditional systems of leadership and patronage. Those who identified with the business and new property interests of the period found themselves in conflict with the traditional, non-business-oriented claims and requirements of the bureaucracies with which they were forced to deal. It became increasingly 'obvious' to money makers that those appointed to bureaucratic offices were a drain on their resources, not there to facilitate their activities but to put obstacles in their way.

This belief led to an increasing insistence that the roles of bureaucratic offices should be clearly defined and limited, and that a clear distinction should be made between the bureaucratic office and the office holder. Holders of offices should be trained for their posts and paid stipends, and should not assume that they could use their offices as means of generating income.⁹⁴ As Trevor-Roper claimed:

To cut down the oppressive, costly sinecures of Church and State, and to revert, *mutatis mutandis*, to the mercantilist policy of the cities, based on the economic interest of society - such were the two essential methods of avoiding revolution in the 17th century.
(Trevor-Roper 1972, p. 77)

During the 16th century religious demands for reform of the Roman Church changed into demands for independence and for the removal of Church authority. By the 17th century there was a strong belief amongst Protestants, property holders and business people that 'responsible' people, primarily those who belonged to the educated and business communities, should be freed from state and Church interference. They should be able to 'develop' themselves, both spiritually and materially, unhindered by state and Church bureaucratic demands.

Entrepreneurs favored the decentralization of political control for business reasons and found themselves in accord with Protestant groups advocating decentralization for other reasons. Inevitably, the arguments of the various groupings became intermixed, with Protestants making claims which could more easily be understood from a mercantile position, and mercantile

entrepreneurs supporting arguments which seemed primarily religious in character.

The growth of mercantile power coincided with the decay of feudal structures and a decreasing acceptance of responsibility for the welfare of their tenants by landowners. By the turn of the 17th century increasing wealth, flowing from imperial expansion, coupled with expanded trade between regions of western Europe, provided a buffer against the unfolding effects of land enclosure and the appropriation of peasant holdings by landowners.

As rural people became displaced, many of them drifted into towns where they could obtain some form of employment. Movement into towns was traditionally linked with the freedom of the individual from obligation to landowners. A presumption of independence accompanied this movement, which naturally allied these displaced rural-urban migrants with a pragmatic Puritanism which emphasized the independent, private rights of individuals against both Church and state.

This sense of independence was coupled with a strong sense of injustice at being displaced from rural holdings which had long been their means of livelihood and identity. Those who should have provided feudal protection had failed them. Traditional authorities could no longer be trusted to protect the rights of the poor and, increasingly, they would be prepared to align themselves with those who opposed such authority.⁹⁵

From the subversion of tradition to plotting the future 🗓️

 (05/02/18)

By the turn of the 17th century there was a growing sense among business people, Puritans and the dispossessed that those who claimed authority on the basis of tradition, whether prelates, princes or bureaucrats, should be displaced by those better fitted to govern, who complied with the natural law requirements of the age.

They too should have the law applied to them, and people should be protected by law from the excesses of a leadership which seemed out of step with the pragmatic business concerns of the age. The 'property-owning, money-making' people of western Europe became increasingly aware that their interests did not coincide with the interests of those who controlled the state bureaucracies of Europe.

There was a feeling in western Europe that life was improving. The terrible uncertainties of the 15th and 16th centuries were being replaced by a dawning sense that the future would be better than the past. The awareness of an uncontrolled madness in the air, which Foucault described, was being displaced by a sense that Europeans, by devoting themselves to the reform of society, could take control of their own destinies.

But, as we have seen, the reform of society required, first, the reform of the person. Those who wanted to reform society recognized that such a change required the reformation of individuals. Individuals should apply themselves to self-development, to self-improvement. Then society would indeed be reformed.⁹⁶

While the world was still in turmoil, the primary ideological assumptions of the emerging dominant groups in western Europe were becoming more certain. Amongst 'responsible' people⁹⁷, those who were demanding increasing freedom and control in western Europe, the feudal thinking of the

past was being displaced by what we now term 'modern' ways of understanding the world. Now, if western Europeans could ensure that people lived by the laws being uncovered in the natural and social worlds they would surely usher in a golden age of prosperity.

Thinkers of the 17th century applied themselves to utopian schemes and dreams. Whether in the writings of Bacon or Campanella, Comenius or Dury, of Hartlib or Hobbes, social philosophy became the discernment of necessary alterations in the present to ensure the realization of a better future. And, it was assumed, the necessary alterations could be ascertained through reasoned consideration of the natural laws which underwrote all valid human activity and organization. The protesters of western Europe became increasingly sure of themselves, aware that they had a destiny to fulfill.

Samuel Hartlib (or possibly Gabriel Plattes), author of a treatise on the requirements of the 'perfect society', *A Description of the Famous Kingdome of Macaria* (1641), ⁹⁸quoting Petty (1649), claimed that the whole world should be reformed:

[T]hat ... the whole World may bee enhappined and all at last come to live in plenty and peace etc. and all warr's cease.

Such reformation could only happen, however, if those who were determined to ensure it had the political authority to set the necessary changes in place.

There was indeed a tide in the affairs of men which taken at its flood would lead to the millennium. The future would be better than the present - provided that society was reorganized to allow people to fulfill their own private destinies and, in the process, bring into being a perfect society based upon the natural laws established by God and being spelt out by Hugo Grotius⁹⁸ and other jurists.

If Aquinas was correct, and each person had a place and purpose in society, then society could only be reformed if individual people were reformed, 'realizing their potential' by living their lives in accordance with the natural laws which God had established. ⁹⁹ 'Responsible' Western Europeans (those who were becoming recognized as the 'middle ranks') were becoming conscious of the goal-oriented nature of life in this world. The individual life should demonstrate *progress*. An individual should aim at *self-improvement*, and self-improvement could only be judged through increasing mastery over the material world around one.

Over a period of more than three hundred years, economically oriented western Europeans moved to a focus on the future, a condemnation of tradition as a validation of action or organization, and an assumption that *progress in this world was inevitable for those who obeyed the laws of God*. Therefore, those who did not progress could be assumed to have not been obedient to the laws of God. As Gellner put it:

The consequence of a belief in progress ... is that time ceases to be morally neutral ... there is, at the very least, some predisposition to tie up *past* with *bad* (in one word: *backward*), and *future* with *good* (*progressive*).

(Gellner 1978, p. 3)

From the late 15th century onwards, with the writing of Erasmus and More, the responsibility of western Europeans for securing the future had become a preoccupation of western Europe. Europe was alive with millenarian

speculation and interpretations of the apocalypse. This time of turmoil and madness was surely the time preceding the return of Christ, and that would herald the arrival of the perfect age.

Before that day, the events spelt out in the Revelation of John ¹⁰⁰ would be fulfilled. The Anti-Christ would be bound and cast into a pit which would be shut and sealed over him for a thousand years. The Beast would be captured and cast into the 'lake of fire that burns with brimstone'. And those who had not worshipped the beast or its image and had not received its mark on their foreheads or their hands would reign with Christ in a perfect society of the blest for a thousand years.

For the subsequent four hundred years the social philosophers of western Europe were to focus on the required precursors of the millennial age which was surely almost upon the world. So institutionalized did this focus become that philosophers were to forget its origins, were to accept its societal assumptions, with their implicit religious underpinnings, without acknowledging them. Europe engaged in a quest for utopia - assumed to be attainable - and in a discovery of the necessary social alterations which must occur to ensure its arrival.

Europe became focused on the future - a real and yet, at the same time, an ideal future towards which the present should be molded. And, because people were now becoming recognized as self-developing, independent and opposed to one another, the attainment of the ideal depended on the diligence with which individuals ensured that they fulfilled the potential of their separate lives.

In the political arena, no less than the philosophical, there was an air of expectancy and of duty. As Trevor-Roper has eloquently put it:

[Oliver Cromwell] believed that a new heaven and a new earth were coming ... and that Christian men had a duty, while reforming the society around them, and gathering up their strength to beat back the temporarily triumphant Anti-Christ, to seek the key to the Scriptures, which were now being fulfilled: the vials that were being poured out, the trumps that were being sounded, and the inscrutable number of the Beast.

(Trevor-Roper 1972, p. 282)

As Hartlib claimed, Europeans were in the process of uncovering 'that model by which the whole world should be reformed' and of ensuring its practical outworking in this world.

Since the millennium was within reach of western Europeans, people had a duty to apply themselves to ensuring its arrival. For the next three hundred years the 'responsible' people of western Europe undertook to organize those who were 'not responsible', ensuring that they lived moral, productive lives. As Polanyi explained,

under Elizabethan law the poor were forced to work at whatever wages they could get and only those who could [demonstrably] obtain no work were entitled to relief.

(Polanyi 1957, p. 79)

The view that the able-bodied poor should be put to work reinforced an emerging belief in the need for employment as both an obligation and a duty. Those who were gaining political and economic control of western Europe were becoming convinced that the promised utopia would be realized only if people diligently applied themselves to whatever work was

available. The state should ensure that employment was available for those without work, and there should be no charity in the form of unearned hand-outs.

Yet, in the early 17th century, this was more easily said than done. As Foucault described:

Despite all the measures taken to avoid unemployment and the reduction of wages, poverty continued to spread in the nation. In 1622 appeared a pamphlet, *Grievous Groan for the Poor*, attributed to Thomas Dekker, which ... condemns the general negligence:

Though the number of the poor do daily increase, all things yet worketh for the worst in their behalf; ... many of these parishes turneth forth their poor, yea, and their lusty laborers that will not work ... to beg, filch, and steal for their maintenance, so that the country is pitifully pestered with them.

It was feared that they would overrun the country, and since they could not, as on the Continent, cross the border into another nation, it was proposed that they be 'banished and conveyed to the New-found Land, the East and West Indies'.

In 1630, the King established a commission to assure the rigorous observance of the Poor Laws ... it recommended prosecuting beggars and vagabonds, as well as 'all those who live in idleness and will not work for reasonable wages or who spend what they have in taverns'. They must be punished according to law and placed in houses of correction.

(Foucault 1971, pp. 49-50)

The necessity to work had become recognized either as a requirement of natural law which, of course, made it an inescapable obligation, or as a requirement of sanctification. As Foucault put it:

If it is true that labor is not inscribed among the laws of nature, it is enveloped in the order of the fallen world. This is why idleness is rebellion - the worst form of all ... the sin of idleness is the supreme pride of man once he has fallen, the absurd pride of poverty ...

In the Middle Ages, the great sin ... was pride ... All the 17th century texts, on the contrary, announced the infernal triumph of Sloth: it was sloth which led the round of vices and swept them on.

(Foucault 1971, pp. 56-7)

Joyce Appleby claimed that

laws were not seen as coming down from authority; rather they worked up from the propensities of people. Policy makers could best realize their aims by working with the known nature of man.

(1978, p. 96)

All people were ruled by the same natural tendencies and biases, so it was possible to formulate legislation which could be applied to everyone, no matter what their status or position. Good law was universally applicable.

Of course, since, as Roscoe Pound (1921) observed, the natural laws sprang from the common law rights of 17th century society, in fact they closely reflected the social circumstances in which they were formulated. Louis Dumont has said of this focus on the propensities of human beings as the basis for law that:

For the moderns, under the influence of Christian and Stoic individualism, natural law, as opposed to positive law, does not involve social beings but individuals, i.e. men each of whom is self-sufficient, as made in the image of God and as the repository of reason.

This is to say that, in the idea of jurists in the first place, first principles regarding the constitution of the state (and of society) have to be extracted, or deduced, from the inherent qualities of man taken as an autonomous being independently of any social or political attachment.

... in short, the hierarchical Christian Commonwealth was atomised at two levels: it was replaced by a number of individual states, themselves made up of individual men.
(Dumont 1965, pp. 29-30)

Those who were morally upright disciplined themselves, living by the natural laws which underwrote all reasonable human endeavor.

This emerging focus on independent individuals was strongly supported by Puritanical insistence on the independent rights of individuals to approach their God directly without relying on mediation by a professional hierarchy. However, the apparent consequences of this insistence on separate rights seemed to be social chaos.

Many people became disturbed by the apparent civil consequences of Puritanical insistence on the rights of independent individuals. Bertrand Russell has neatly summed up the fears of the mid-17th century:

Every community is faced with two dangers, anarchy and despotism.

The Puritans, especially the Independents, were most impressed by the danger of despotism.

Hobbes, on the contrary having experienced the conflict of rival fanaticisms, was obsessed by the fear of anarchy.

(Russell 1979, p. 539)

If one emphasized independent individual rights, one had, simultaneously, to spell out independent individual responsibilities.

Moral people abided by the terms of the social contract. Their lives conformed to the natural law requirements of all members of society. And those natural laws could not be challenged. They had been established by God. If, as Newton was to demonstrate and Galileo had already described, the planets obeyed natural laws when orbiting the sun, equally, members of society obeyed natural laws when they conformed to the moral rules of society.

By the mid-17th century, with the English revolution, political power in England passed into the hands of property owners. For almost two hundred years they had been arguing for the curtailment of power derived from tradition. Laws which stemmed from 'traditional' authority were increasingly regarded as suspect.

The legal systems of western Europe, but particularly of Britain, were being refashioned to reflect the basic assumptions underpinning what we now call 'democracy'. Protestant jurist-theologians provided the theoretical charter based upon the natural rights of human beings. This gave legitimacy to the individualism of Protestant and merchant groups and to an increasingly insistent demand for economic and political freedom to pursue one's own interests.

In the Europe of decaying feudalism, land ownership had become increasingly seen as ownership of the thing itself, with particular social and material costs and prices attaching to it. Not only was there an emerging recognition of the differences between government and people, there was a parallel recognition of the difference between people and their physical environments.

It was becoming increasingly certain to most western European landowners that people *used* land rather than being identified with and defined in terms of locality. It was becoming equally clear that the poor were potential labor and that, just as property owners had a duty to use their land resources productively, so government should ensure that this labor resource was prepared and able to be employed productively.

Sir William Coventry, somewhere round 1670, put it most clearly when he argued for the repeal of the Poor Laws and the development of workhouses 'where such as will not work for themselves may be compelled to work for others'.

'Public' V 'Private': Oppositional Couplets; Categories of Likeness

★ ...there is, at the very least, some predisposition to tie up *past* with *bad* (in one word: *backward*), and *future* with *good* (*progressive*). (Gellner 1978, p. 3)

Appleby has summed up the new mood well:

The emancipation of property owners from most forms of political control over the use of their land and money had shifted the source of economic planning from regulations shaped by the past to private decisions oriented toward the future.

Where earlier the disposal of a harvest or the pursuit of a trade had been conditional upon the likely social impact, the acceptance of near-absolute property rights had driven a wedge between society and the economy.

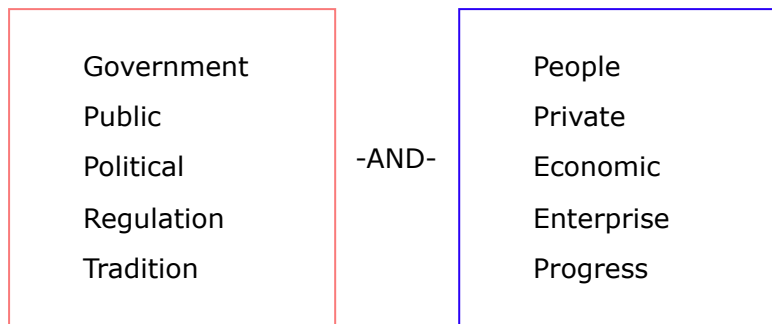

With the curtailment of political oversight over economic life, the formal link between the material resources of the country and the people to be sustained by them had been cut. The commonwealth had become an aggregation of private wealth.
(Appleby 1978, p. 151)

In western Europe, decentralization of political authority, reassertion of individual rights and responsibilities, and demand for deregulation of economic activity became interfused. These became increasingly seen in terms of oppositional couplets:

- ★ Government versus People;
- ★ Public versus Private;
- ★ Political versus Economic;
- ★ Regulation versus Enterprise;
- ★ Tradition versus Progress.

And, as perceptions matured, demands for clear separation between the social expressions of those oppositions became more forceful.

This separation was not simply a matter of recognizing and spelling out social oppositions. Not only were there oppositional pairs, there were also conceptual categories of likeness:

It became difficult to assert the need for the clear separation of one oppositional pair without, by implication, asserting the need for the rest.

Entrepreneurs became religiously and socially respectable. But they did not, for these reasons, become any less earthly-minded. It was their individualistic pragmatism which had brought them into alignment with religious protest groups. Each party in the alignment simply assumed their own orientation in those with whom they associated.

They should Become "Habituated to Labor and Fatigue"

The consequences of this new-found respectability and assumption of religious morality were not to the advantage of less fortunate members of society. Yet, as Wilson argues in focusing on the 18th century poor law,

The social legislators of the Restoration aimed at nothing less than making the poor a source of profit to the state by forcing them to work for reduced wages [but]

...what came to be regarded by later critics as a system of calculated brutality and repression arose in the first place not from unconcern or harshness, but out of a desire to protect the efforts of those local authorities who were trying hardest to improvise remedies.

(Wilson 1969, pp. 119, 134)

As property owners and their allies took control of government, they became increasingly insistent that the 'natural laws' which underwrote their activities should be applied to all people. So important did it appear to be to ensure that the poor became involved in productive activity that otherwise moral and upright people could entertain extreme measures to ensure that this happened.

A major problem among the poor was that there appeared little desire on their part to increase their material possessions or to indulge in work for work's sake. There was therefore little incentive to engage in continued labor beyond that which was required to supply their perceived needs ¹⁰¹. This attitude made labor inefficient and the laboring poor unreliable workers. They needed external stimulus to labor. In 1700, in setting out labor laws for the Crawley Iron Works, Crawley spells out his problem:

Some have pretended a sort of right to loyter, thinking by their readiness and ability to do sufficient in less time than others. Others have been so foolish to think bare attendance without being employed in business is sufficient ... Others so impudent as to glory in their

villany and upbrade others for their diligence.
(quoted in Thompson 1967, p. 81)

The poor felt that they were being employed for a particular set of tasks. Crawley felt that he had hired their *potential to labor*, and that they should 'put in a good day's work'. His solution was to provide external checks on the punctuality and performance of laborers:

Every morning at 5 a clock the Warden is to ring the bell for the beginning to work, at eight a clock for breakfast, at half an hour after for work again, at twelve a clock for dinner, at one to work and at eight to ring for leaving work and all to be lock'd up.
(quoted in Thompson 1967, p. 82)

Since there was no internalized discipline in these laborers, they had to be regimented and checked by those who could supply such discipline.

Over succeeding decades this problem of ensuring greater reliability and effort from the laboring poor was a perennial concern of those who wanted to harness the productive possibilities of the century. In order to ensure consistency, those in charge seemed to need to be constantly vigilant against a population apparently determined to impair their constitutions by laziness and dull their spirits by indolence (Thompson 1967, p.83).

Employers were looking for ways in which consistent effort could be guaranteed. One of the best seemed, initially, to compel laborers to conform to clock time. Factories had clocks built into their facades, which chimed the time so that laborers would know when to start work.

Schooling was quickly seen as one of the prime means by which people could be taught the importance of punctuality and sustained labor so that,

by the time the child reached six or seven it should become
"habituated, not to say naturalized to labor and fatigue".
(Thompson 1965, p. 84)

Inevitably, over time, less scrupulous employers started to manipulate their clocks, starting early and finishing late by altering the time shown:

... in reality there were no regular hours; masters and managers did with us as they like. The clocks at the factories were often put forward in the morning and back at night, and instead of being instruments for the measurement of time, they were used as cloaks for cheaterly and oppression.
(quoted in Thompson 1965, p. 86)

This practice, far from undermining people's reliance on measured time, made people increasingly conscious of 'correct' clock time, of working 'to the clock'.

However, all the measures adopted during the 18th century to retrain people to 'use their time productively' were of mixed success, and on into the 19th century employers and reformers continued to lament the indolence of the laboring poor ¹⁰².

In the second half of the 18th century, Townsend provided one of the more extreme solutions to the problem of compelling people to diligent work, which was to be taken up in the early 19th century:

...hunger is not only a peaceable, silent, unremitted pressure, but, as the most natural motive to industry and labor, it calls forth the most powerful exertions; and, when satisfied by the free bounty of another,

lays a lasting and sure foundation for good will and gratitude ...
(¹⁰²Joseph Townsend 1786)

To the bridle of time discipline was to be added the spur of necessity. If people's needs could be kept at a high level, then their efforts to supply their needs would ensure consistent long-term 'habits of industry'. The silent, unrelenting pressure of a constant threat of starvation, which could only be countered by engaging in wage labor, could be relied on to channel people into 'adopting those habits of industry, which always tend to steadiness and sobriety of conduct, and to consequent material wealth and prosperity' (Codere 1950, p. 24).

These means were to be reinforced by developing education for the poor. From John Bellers who, in 1696, suggested the establishment of 'colleges of industry' in which the 'involuntary leisure of the poor could be turned to good account' (quoted in Polanyi 1957, p. 105), to increasingly frequent attempts at the social education of the poor during the 18th and early 19th centuries. It became a recognized social responsibility of mature people to re-educate the morally suspect poor and to ensure, in the meantime, that they were gainfully employed.

By the middle of the 18th century, the primary ideological assumptions of modernity had become well established. Now, it seemed, to most well-educated, well-enculturated western Europeans that people were (or should be) undeniably separate, private, self-developing, acquisitive individuals whose moral and social worth could be calculated by observing the extent and nature of their private property.

It seemed equally certain that economic enterprise should be undertaken by private individuals and corporations, not by the state, but that the state had responsibility to ensure that the workforce was properly trained and that those who would not work were put to work.

Perhaps the most successful of the 18th century social philosophers was Adam Smith ¹⁰³ - not because he had anything particularly new or revolutionary to say - but precisely because what he had to say expressed the emerging primary ideological assumptions of western European industrialism when increasing numbers of British people were already organizing their lives and thinking in terms of them.

He made explicit, in an organized form, what people already unconsciously 'knew'. And, of course, he is recognized as the father of economics. He also, in a way which may now be difficult to understand if one reads his writings, became an immensely popular author. His work, particularly *The Wealth of Nations* (Smith 1974), which was first published in 1776, became the topic of drawing room discussion. People easily identified with his description of how the world was, or should be, organized, but that description was novel in the literature of the time.

Western Europeans did not become economically oriented because Adam Smith provided a systematized account of rational economic behavior. Those in control were already economically oriented. Adam Smith systematically described what was happening around him. The primary assumptions of those in control in the mid-18th century already assumed the existence of independent, self-interested, competitive, acquisitive, rational beings, focused on life within an economic environment.

Adam Smith made the inevitable, *moral*, by spelling out the system of laws which underwrote economic behavior. Since economic behavior was

governed by rational conformity to natural laws it could scarcely be otherwise than morally acceptable.

By the late 18th century, at the outset of what we now refer to as the *industrial revolution*, prosperous western Europeans *knew* that life should be lived in an economic environment, that they were private, self-promoting individuals whose lives were oriented to use of the material world, with the correct forms of relationship and organization spelt out in the 'economy'.

Moral people worked hard. The evidence of their morality was their increasing prosperity. Their increasing prosperity could best be demonstrated by increased accumulation of possessions and by increased consumption. The ways in which they should engage in economic activity were all spelt out by the 'principles' through which they could guarantee both individual prosperity and the wealth of the nation. Those principles had been distilled through five hundred years of history.

Moral western Europeans 'knew' that there were *natural laws*, and that, whether they had been established by God or not, conformity to them would lead to a better world. On the other hand, failure to live by them would bring chaos and poverty. Western Europeans had a moral duty to transform the world by reorganizing it to conform to the rules and regulations which guaranteed successful economic endeavor and burgeoning material prosperity.

Conclusion 🐦

The past two hundred years have seen the primary ideological presumptions of Western Europe become those of more and more of her people, whether in Europe or in colonized lands. And, as Western Europeans have become increasingly convinced that these presumptions are features of the real world, they have increasingly devoted their time to defining and particularizing the rules and principles of economic activity and organization.

The past fifty have been years in which Western 'experts' have increasingly insisted on reorganizing the rest of the world to engage in 'correct' economic activity and organization. This reorganization requires:

- ★ the establishment of institutions and bureaucracies to govern economic enterprise;
- ★ the reorientation of government to guarantee a secure fiscal, legal and social background appropriate to the self-interested, contractual activities of private individuals in pursuit of wealth and independence;
- ★ and the establishment of the statutes and regulations governing 'formal economic activity'.

One of the continuing problems for Western Europeans, who are as convinced of the need to transform the world as their forebears were, is that so little of the economic activity in Third World countries conforms to the prescriptions of formal economics. People seem, all too easily, to engage in forms of activity and develop forms of organization which are clearly 'informal' and 'illegitimate'.

As was said at the start of this discussion, the primary ideological assumptions of any community change through time. They both reflect

experiences of the past and modify those of the future. The primary ideological assumptions of Western Europeans have given birth to a number of competing secondary ideologies, and to a felt compulsion on the part of Europeans to refashion the rest of the world to participate in 'economic development'.

Both the Western assumption of the independent existence of an 'economic environment' and the equally accepted belief that there is an objective set of laws governing behavior in that environment come from, and reflect, the particular historical experiences of Western Europeans over a thousand years.

Every community has such a history, whether written or not. And all communities think and act on the basis of primary ideological presumptions which stem from their own unique history. It is as difficult to change the forms of organization and behavior of other communities which are based on their primary ideological assumptions as it would be for Western Europeans to live their lives in terms of the understandings of another society.

To the extent that Western 'experts' demand that other communities deny those basic features of their world which they 'know' to be true, and that they, instead, live by Western presumptions, they bring confusion and disorientation to individual lives and to communities. If these communities need to 'develop', that development must be on their own terms, based upon their own primary assumptions and filtered through their own secondary ideologies. Otherwise, advisers bring not 'development' but confusion to the lives of other people.

If there are increasing numbers of people who are becoming marginalized in non-Western communities, they are being marginalized by forms of organization, interaction and understanding which come from Western Europe's historical experiences. Only by allowing them to reorganize the world from their own perspectives can that marginalization be countered. Then, of course, Western Europeans will find themselves marginalized, unable to come to grips with the forms of organization and interaction which they experience when living in those communities.

If other communities, organizing life in terms of their own primary assumptions, become industrially organized, it may well be that some will prove to be better at the game of competitive profit making than the West. But the West is likely to find it difficult to understand what gives them their edge ¹⁰⁴. They are also likely to argue that the competitive advantage of those communities comes from their engaging in illegitimate forms of economic organization and activity.

Chapter 4: How Born Again Christians Rescued Capitalism †

They have divided their nations...

In Search of the 'Greatest Good' - The *Summum Bonum*

- *The Economy* : a new 'Environment'

The Need to separate Government and Commerce

A Deeply Religious Capitalist Revival

- Born-Again to Industry: the Conversion of the little gentry
- Born Again Manufacturers and Retailers

A New Moral Leadership and Support Network

- First The Savages at home, then the rest of the World!

★ ...they have divided their nations into two classes, wolves and sheep. I do not exaggerate. This is a true picture of Europe. ...man is the only animal which devours his own kind; for I can apply no milder term to the governments of Europe, and to the general prey of the rich on the poor. (Thomas Jefferson, 1787) ¹⁰⁵

The 18th century saw the crystallization of what, in later centuries, would be considered 'modern' forms of understanding and action ¹⁰⁶. This was the century of 'the enlightenment':

- ★ the time when western European educated and wealthy 'middle sorts' ¹⁰⁷ became increasingly convinced of the *material* nature of life in this world;
- ★ the time when they began to live life by truly 'rational' principles as independent, autonomous, self-interested individuals whose activities would inexorably produce both individual and social well-being;
- ★ the time when they took increasing responsibility for mastering and profitably 'using' the natural world;
- ★ the time when most of the remaining rural laborers and small farmers were dispossessed of their livelihoods and robbed of their access to land;
- ★ the time when the activities of Protestant evangelists, coupled with the catastrophic failure of small businesses and impoverishment of trades people (the 'little gentry'), dependent on the patronage of the 'poor', kick-started capitalism into an industrial revolution;
- ★ and the time when the 'middle sorts' finally took full responsibility for re-educating the 'indolent poor' ¹⁰⁸.

This was the century in Western European history when the turmoil of previous centuries had distilled into a new version of 'objective reality' for those who held the reins of power. It was the century in which they would take responsibility for transforming the rest of the world to live by the reality they now lived in - starting with their own, home grown 'savages'. It

was also the century in which the justification for natural laws shifted from divine decree to the innate characteristics of environments in a self-existent natural world ¹⁰⁹.

In social thought, independent, autonomous individuals became the 'atoms' of human interaction and society. As Louis Dumont put it,

the hierarchical Christian Commonwealth was atomised at two levels: it was replaced by a number of individual states, themselves made up of individual men.

(1965, pp. 30)

The material realm, also, would be found to be comprised of independent 'atoms' - the building blocks of a new reality resulting from the new understanding of the world. And a new 'environment' would be conceived, to contain and explain the newly apprehended natural laws found to be driving human ambition and the wealth of nations.

In Search of the 'Greatest Good' - The *Summum Bonum*

All the presumptions of the past concerning the nature and purpose of natural laws remained intact. It seemed absurd to question the *Summum Bonum* consequences of employing them in furthering human control of the material world ¹¹⁰. By conforming to and employing the principles being uncovered in daily life, human beings could look forward to living in the best of all possible worlds.

Immanuel Kant would explain this at the end of the century,

The realization of the *Summum Bonum* in the world is the necessary object of a will determinable by the moral law. But in this will the perfect accordance of the mind with the moral law is the supreme condition of the *Summum Bonum*.

(1788 Bk 2, Ch. 2, pt. 4)

For increasing numbers of the 'middle sorts' in the 18th century, individuals were self-existent, self-developing beings. The presumption of previous centuries, that "the state is by nature clearly prior to the family and to the individual, since the whole is of necessity prior to the part" (Aristotle, *Politics* Bk 1, Part 2) ¹¹¹ now seemed under attack.

To the intellectual protagonists of the century, the controversy between atomism (human beings can be thinking, rational beings independently of social relations) and holism (social relations are essential to human beings insofar as they are thinking, rational entities) was a real one, perceived as a confrontation between materialism and spirituality, between atheism and godliness. It was, however, the logical outcome of [Aquinas's model](#) in an age when life within this world became the dominant focus, with religion secondary in importance to material prosperity for those who held the reins of power.

Now, one did not start from a presumption of perfect wholes and distill the laws which enabled them and determined the nature of their parts. One started with the 'atoms' from which the wholes were extrapolated and determined the innate characteristics of those atoms. One then extrapolated from that information to ways in which the atoms could best be 'developed' and combined to yield their *potential* ¹¹².

For those 'on the side of God', human beings reaped the rewards of their morality. And that morality was summed up in obedience to the 'will of God' spelt out in the natural laws he had established to ensure the perfection of the natural world.

For those 'on the side of nature', human beings exercised their innate talents, pursued their own 'natural' interests, and reaped the rewards of successfully doing so. Conformity to the 'real' nature of human beings, it was assumed, must necessarily result in the *Summum Bonum*.

It is this implicit presumption of collective good being a necessary outcome of individual self-interest ¹¹³ which is the inconsistent heart of utilitarian philosophies of the period and of the gamut of utilitarian and economic models which have flowed from them.

œ[Bernard Mandeville's acerbic verse](#) on the ways in which the private vices of the bees of a hive produced prosperity for the whole, set the scene for confrontation between the two perspectives,

... every Part was full of Vice,
Yet the whole Mass a Paradise;
Flatter'd in Peace, and fear'd in Wars
They were th'Esteem of Foreigners,
And lavish of their Wealth and Lives,
The Ballance of all other Hives.

Such were the Blessings of that State;
Their Crimes conspired to make 'em Great;
And Vertue, who from Politicks
Had learn'd a Thousand cunning Tricks,
Was, by their happy Influence,
Made Friends with Vice: And ever since
The worst of all the Multitude
Did something for the common Good.
(1705, lines 155-168)

By the 1720s Mandeville's verses, together with a range of similar writings, were provoking a storm of protest from those who knew that the material gains of prudence and industry came not from self-interested greed but from correct application of and adherence to the laws of God which underwrote the natural world.

It seemed that the very basis for morality was being undermined. If Mandeville's assertions were right, then morality was a chain about the neck of society, and immorality was virtue well disguised. The fundamental principles underpinning the natural rights of human beings seemed to be under challenge as these thinkers pointed to greed and self-interest as the fundamental motivational factors leading to material success and the consequent *Summum Bonum*.

By the 18th century, there were a number of fundamental presumptions which 'responsible' western Europeans subconsciously employed in 'making sense' of their world ¹¹⁴ :

- ★ order was built into the 'structure' of the universe;
- ★ the material and sensible world was separate from and independent of the supernatural, governed by its own ordering principles;
- ★ human beings were separate from, and should control and 'develop' their material environments which, when developed, would yield their 'potential';
- ★ entities within any environment could be separated into their constituents which could then be recombined in a range of ways, limited only by human ingenuity and the laws governing form and process in each environment.
- ★ the principles upon which 'natural order' rested were not only explicable and immutable, but also, in their correct utilization, would inexorably produce social and individual well-being. Even if, in the short term, this did not appear to be the case.
- ★ there could be 'no gain without pain' ¹¹⁵. Not only did the responsible people of western Europe believe in the existence, and positive consequences of employing natural laws, they also firmly believed

that short term hardship is usually necessary in order to secure long term well being ¹¹⁶.

The Economy : a new 'Environment'

The search for natural laws, and determination to live by them, had been a preoccupation of western Europeans over several centuries. That search focused on phenomena which were identified as belonging within recognized 'environments' of the natural world. Sets of natural laws were derived from and legitimate within the domains within which they had been distilled.

By the 18th century, a number of distinct environments had been identified in the non-human material realm ¹¹⁷. However, in the realm of human existence in the natural world, no distinct environments had been identified. All human activity was considered contained within the 'social' domain, interconnected and subject to the same set of 'moral' laws.

At the start of the 18th century, the money-makers moved to center stage. Their behaviors became accepted as important to the well-being of all members of society and the nature of their activities became the focus of serious deliberation. Mandeville's observations might have been delivered with sardonic humor, but he meant what he said.

Natural laws were not merely important in explaining the operation of the natural world, they also justified what they explained. They provided legitimate, indeed, necessary means for successfully manipulating (for the common good) those areas of the natural world which western Europeans recognized as having objective existence. Now, however, it seemed as though the area of natural law which applied to human behavior was flawed. How could it be that the self-interested 'unsocial' behavior of those engaged in trade could contribute to the *Summum Bonum* ?

Attempts to explain this, were to produce recognition of the first social 'environment', anticipated in the 17th, but formally outlined in the 18th century - *The Economy*. Since its 'discovery', this new environment, through the laws and associated structures formulated and reformulated within it, has increasingly dominated and controlled life in Western European communities.

In the first half of the 18th century, the money-makers of Europe were in relatively secure political control. Their activities were accepted as fundamental to social and individual wellbeing by those who now dominated political life in Britain and Western Europe.

However, it became increasingly obvious that there were certain fundamental human behaviors which seemed to underwrite economic success, which were not in harmony with the moral laws which western European jurists had identified and spelt out in the 17th century ¹¹⁸. These behaviors had not been incorporated within the moral law structures developed in the 17th century and seemed, once they were identified, to challenge and often invalidate them.

Bernard Mandeville (1718) directly focused on this problem in his *Fable of the Bees*. As Harold Cook explained,

The book seemed to argue that what most people recognized as human vices were the main engines of the collective good.

Mandeville's critics,

correctly detected a view of reason that made it largely into a device for calculating ends rather than for developing inner moral wisdom. The essay began with a meditation on whether people really did act out of charity, defined as

that sincere Love we have for our selves ... transferr'd pure and unmix'd to others, not tied to us by Bonds of Friendship or Consanguinity.

Acts on behalf of friends and family, or to gain honor and public respect, were not counted as truly charitable by this definition. Nor were any actions arising from the passions of pity or compassion, which make us feel better when we indulge them.

Pride and Vanity have built more Hospitals than all the Virtues together,

Mandeville declared, referring sarcastically to the recent munificent gifts in the will of Dr. John Radcliffe.

Mandeville went on to declare that

Charity, where it is too extensive, seldom fails of promoting Sloth and Idleness, and is good for little in the Commonwealth but to breed Drones and destroy Industry.

He urged that while the helpless needed relief, most seeking charity should be put to work.

(1999, pp. 101, 104)

For the next fifty years controversy was to rage in gentry circles as to whether the recognized virtues of a social conscience *did* undermine sound economic management and promote sloth, or whether the apparent logic of Mandeville's assertions was nothing more than well phrased sophistry.

For those who believed that the moral virtues were primary and that life should conform to them, it was necessary to actively address the social problems of the age through education and a variety of forms of welfare. For those who saw the virtues of the age as undermining sound economic management, well-meaning people simply compounded the difficulties they sought to ameliorate. This was to be a theme which grew louder as the century passed, producing a range of policies aimed at ensuring that the gentry were freed to disciplined self-interest. ¹¹⁹

In the intellectual climate of the 18th century, it is scarcely surprising that someone should finally conclude that such behavior related to a particular realm of social life, an environment with its own internal logic and operational principles or laws. The necessary behaviors which underpinned success in this environment really did seem to conflict with the recognized moral virtues which applied to the rest of life.

Of course, if an environment was discovered, it would be found to be governed by its own set of natural laws, essential to successful endeavor in that environment, but illegitimate in other environmental contexts. Behaviors and attitudes which seemed to threaten the moral values of social and spiritual life, could be contained, insulated within the bounds of this new environment.

Appropriately, the nature of this new environment was to be distilled and explained by someone who had trained for the Anglican clergy and could be considered a morally responsible gentleman. As Adam Smith (1723-1790) explained, in a hugely popular text entitled *An Inquiry Into the Nature and*

Causes of the Wealth of Nations (1776), the apparent contradiction between moral virtue and the requirements of successful economic activity was due to a confusion of environments.

It could be traced to a failure to recognize that all *economic* activity conformed to sets of principles which were appropriate to *economic* behavior. There was a confusion of environments implicit in the observed contradiction.

Just as all other environments in the world were governed by natural laws which determined their characteristics, so was 'the economy' governed by a set of natural laws. These laws determined not only its characteristics, but also the kinds of behavior appropriate for individuals and groups *when engaged in economic activity*.

So, behavior which was highly appropriate in economic activity could still be regarded as entirely inappropriate in other spheres of life. On the other hand, to apply those values which related to non-economic activity within an economic setting would produce economic malaise.

'The economy' was a self-existent, self-sustaining environment, with its own peculiar characteristics and principles of organization and behavior. And, of course, if natural laws were found within this newly described environment, human beings had a moral responsibility to live by them. ¹²⁰

The movement of the money-makers of western Europe from the demonized periphery of the 10th and 11th century medieval world ¹²¹ to the sanctified center of the new modern world was complete. They not only could be considered moral by association with religious reformers, now they were moral because of the very behaviors and attitudes in which they engaged in making money.

Indeed, a new kind of immorality was to emerge, that demonstrated by people who, when engaging in economic activity, did not conform to the necessary behaviors and attitudes and so jeopardized not only their own activity, but the activity of all those with whom they associated. What Kant was to assert concerning moral law could be asserted with equal certainty of economic law, 'the perfect accordance of the mind with the [economic] law is the supreme condition of the *Summum Bonum*.' As Adam Smith explained, considering the activities of merchants,

... he intends only his own gain, and he is in this, ... led by an invisible hand to promote an end which was no part of his intention. Nor is it always the worse for the society that it was no part of it. By pursuing his own interest he frequently promotes that of the society more effectually than when he really intends to promote it.

I have never known much good done by those who affected to trade for the public good. It is an affectation, indeed, not very common among merchants, and very few words need be employed in dissuading them from it.

(1776, Book 4 Ch. 2)

Here was a solution which rescued moral virtue, while establishing the appropriateness, indeed, the *necessity* of self-interested behavior in economic activity.

In keeping with the times, Smith claimed to have distilled the laws of economics through an examination of the actual economic behavior of people ¹²². In doing so he seemed to satisfy both sides of the controversy.

He had distilled his laws from the 'real' world, but he had, at the same time, rescued moral virtue from the materialist assault. Both camps could accept the laws he presented without seeming to betray their own positions ¹²³.

The capitalist could, quite reasonably, be a self-interested individual intent on his own gain on Friday and a public spirited philanthropist on Sunday (or even at the same time in different contexts!) and remain a truly moral, consistent person throughout.

Inevitably, Adam Smith became the 'father of economics', the person who first spelt out the natural laws which underwrote economic organization and activity. At the same time, his writing reaffirmed, for Western European 'responsible' people, the correctness of both their understandings of the world and their preoccupation with economic activity.

Of course, when one distills the fundamental attributes of human beings from the current behaviors of oneself and one's compatriots, inevitably, those behaviors which stem from the primary ideological presumptions of one's own community become accepted as the fundamental attributes of all people.

Adam Smith did for economics what Pound (1921) claimed Grotius did for the "natural rights" of human beings ¹²⁴. Just as the common law rights of the English became the natural rights of all people in the 17th century, so the economic predilections of 18th century British gentry became the instinctive behaviors and economic motivations of human beings ¹²⁵.

From that time to the present, western Europeans, whether in their homelands or in their colonized worlds, have assiduously applied themselves to refining and expanding the 'natural laws' which underwrite economic activity and organization. Of course, the task is not yet, and never will be, complete. As we've already seen, the primary ideological presumptions upon which human understanding is founded are in long-term flux through a Heraclitean¹²⁶ dialectical interaction with the environments which human beings define and within which they live.

Over the last two hundred years western Europeans have attempted to reach a consistent and coherent explanation of the positive consequences of the exercise of both economic self-interest and moral virtue.

- Could it be that the apparently contradictory requirements of economic and moral law might, in some less than obvious way, or at some 'deeper' level of congruence, work together for good?
- Might human beings achieve much more in life through holding the requirements of moral and economic law in tension?

If this could be shown then, indeed, economic activity would receive its final validation ¹²⁷.

It was, perhaps, inevitable, that it would be the foremost Western European philosophical thinker of the late 18th century who would first convincingly draw the threads together. John Locke's philosophical validation and justification of modern primary ideological presumptions had established the early credentials of modern business ¹²⁸. Immanuel Kant, a century later, would explain why the apparently contradictory sets of economic and moral laws were *both* essential in reaching toward the *Summum Bonum*.

There is an innate antagonism between opposed human capacities which is mediated in human nature. Through a dialectical tension, or 'antagonism', between self-interest and sociability, all the finest qualities of human society and achievement are generated.

By antagonism, I here mean the unsocial sociability of mankind - that is, the combination in them of an impulse to enter into society, with a thorough spirit of opposition which constantly threatens to break up this society.

The ground of this lies in human nature. Man has an inclination to enter into society, because in that state he feels that he becomes more a man, or, in other words, that his natural faculties develop. But he has also a great tendency to isolate himself, because he is, at the same time, aware of the unsocial peculiarity of desiring to have everything his own way; and thus, being conscious of an inclination to oppose others, he is naturally led to expect opposition from them...

All the culture and art which adorn humanity, the most refined social order, are produced by that unsociability which is compelled by its own existence to discipline itself, and so by enforced art to bring the seeds implanted by Nature into full flower.

(Kant 1784 p. 147)

Human beings are 'compelled' by their unsociability to *discipline* themselves and from that discipline flow the enhancements and benefits of 'all the culture and art which adorn humanity'. [The corollary, of course, is that lack of self-discipline threatens the 'refined social order'.](#)

Human beings who wished 'to bring the seeds implanted by Nature into full flower' had a responsibility not only to be self-disciplined, but also to discipline those who seemed unable or unwilling to discipline themselves. Stifle that urge to unsociability, and one stifles human progress. At the heart of human progress lies disciplined independent individualism. The manure of competitive self-interest grows beautiful flowers! ¹²⁹

By the middle of the 19th century Kant's explanation had grown into a belief ¹³⁰ in the innate propensity of human beings, allowed to indulge in unfettered self-interest and self-promotion, to produce the common good. The moral virtues of an earlier age were to be displaced, for many western Europeans, by a belief that all things work together for good - provided self-disciplined individuals are freed to pursue their own self-interested ends.

Life was to be considered an evolutionary adaptation of individuals to their environments. Provided it was not distorted and choked by government regulation and direction, this would result in the best possible adaptation of not only individuals but of human societies to their environments ¹³¹.

The Need to separate Government and Commerce 🐞

Increasingly, as the 19th century unfolded, it was to be argued that social and political controls, regulations, and 'interference' in individual lives produced only social ill. The only role for government was that of ensuring that no-one and nothing interfered with the right of each self-disciplined individual to pursue his or her own self-interest uninhibited by social and political rules and regulations. The role of government would become seen as that of a 'watchdog' of private liberty and a stern school-master to those who threatened disciplined self-interest.

For those who took the new doctrine to extreme, and there were many very influential people in this camp by the latter half of the 19th century, governments should not get involved in trying to 'improve' society. Such attempts were doomed to long-term failure. The role of the state was the *protection* of those who, through their disciplined self-interest, had acquired the wealth which was its sure reward ¹³². The 'free market' would sort out everything else!

Thomas Huxley (1871) described the position of those who opposed legislative attempts at improving the lot of the poor in the second-half of the 19th century:

... the Education Act is only one of a number of pieces of legislation to which they object on principle;

and they include under like condemnation:

- the Vaccination Act, the Contagious Diseases Act, and all other sanitary Acts;
- all attempts on the part of the State to prevent adulteration, or to regulate injurious trades;
- all legislative interference with anything that bears directly or indirectly on commerce, such as shipping, harbours, railways, roads, cab-fares, and the carriage of letters;
- and all attempts to promote the spread of knowledge by the establishment of teaching bodies, examining bodies, libraries, or museums, or by the sending out of scientific expeditions;
- all endeavors to advance art by the establishment of schools of design, or picture galleries;
- or by spending money upon an architectural public building when a brick box would answer the purpose.

According to their views, not a shilling of public money must be bestowed upon a public park or pleasure ground;

not sixpence upon the relief of starvation, or the cure of disease.

Those who hold these views support them by two lines of argument.

They enforce them deductively by arguing from an assumed axiom, that the State has no right to do anything but protect its subjects from aggression. ...

These views are supported *a posteriori*, by an induction from observation, which professes to show that whatever is done by a Government beyond these negative limits, is not only sure to be done

badly, but to be done much worse than private enterprise would have done the same thing.

(^œAdministrative Nihilism (1871) in *Collected Essays*, 1893, p. 258-9)

133

In order to understand how these views could become so dominant one needs to understand the social and political tensions of the preceding century. The 18th century saw the flowering of the assertion of near-absolute property rights and the private aggregation of wealth, which had matured in the previous century. Self-interested pursuit of wealth and accumulation of property had become socially approved.

Over the next 150 years, the gentry pursued their own interests at the expense of all those who lacked the political or economic power to resist them. They dispossessed most of the small holders of Britain and completed the alienation of the commons ¹³⁴ from those who had for centuries relied on access to it for survival.

In the process, millions lost access to rural resources and were forced into relying on parish welfare support ¹³⁵. Then, because the burden became too great for the parishes to sustain in the long-term, the dispossessed were compelled to move to the emerging industrial towns of Britain. As the process compounded the problems of the poor, many were compelled to move to the 'New Found' lands which were rapidly becoming a destination for people who felt or found themselves disenfranchised by developments in the 'Home Country' ¹³⁶.

By the start of the 18th century, Britain, with most of the rest of western Europe to one extent or another, had in place all the necessary primary ideological understandings, motivations and organizational processes and practices which would produce both the discipline of economics and the 'industrial revolution'. What it lacked, was a deep religious commitment to capitalism.

The 'middle sorts' now thought and organized life as capitalists. However, their earthly-minded materialism, self-satisfied complacency and self-interested stripping of the livelihoods and entitlements from more than half the population could very easily have produced not an industrial revolution but a 'revolution of the proletariat'. Without the continued religious dedication and commitment to 17th century morality of a small minority of the gentry, the self-interested greed of the 'middle sorts' in the early 18th century might well have reduced capitalism to a footnote in European history.

A Deeply Religious Capitalist Revival 🇺🇸

 (18/03/16)

But for the peculiar consequences of the dispossession of small landholders and the consequent undermining of small business through much of Britain, capitalism might well have faltered in the 18th century, another 'blind alley' of history ¹³⁷. Those who held the purse-strings of Britain, in their self-interested drive to accumulate property and wealth, not only dispossessed 'the poor', they threatened the livelihoods and wellbeing of less affluent members of the middle ranks. Less wealthy households and individuals, who held to the same understandings and were motivated by much the same impulses as the financiers, stock-holders and large property owners, were being threatened by their activities with both social ruin and material destitution. ¹³⁸

These 'little-gentry' found themselves victims of policies and practices geared to enhancing the wealth and increasing the property of those with political clout. And, as they either lost their livelihoods or became fearfully aware of the possibility of becoming destitute, they found themselves being treated as though they were members of those 'lower ranks' who 'ought' to be subjected to the disciplines of the century. ¹³⁹

It would be easy to see battle lines drawn in 18th century Western Europe between the reforming 'middle ranks' and the oppressed 'lower ranks' of the century. But this would be a distortion of reality. Those consigned to the lower ranks of society had lived through the same centuries as the middle rank reformers. The growing influence and authority of the money makers of western Europe had not left them untouched.

While the broad rankings of society included the aristocracy, gentry and 'the poor', there were, between each ranking, large numbers of people who did not quite fit the stereotypes of the age:

- There were aristocracy who more properly seemed to be middle ranking in their behavior and in their fortunes, and middle ranking people who moved easily in the ranks of the nobility.
- There were middle ranking people who, in their behavior and fortunes could easily be ranked with the poor, and people who might be considered peasants or yeomen but who moved easily in the ranks of the gentry.
- In particular, there was a substantial grouping which comprised small landholders, artisans, tradespeople and other small business people who certainly considered themselves separate from 'the poor', and, in their own minds, were ranked as 'almost gentry'.

The 'almost gentry' and those who identified with them as employees and neighbors - in England, who had fought with the forces of Oliver Cromwell - very often held the opinions of the gentry toward the 'idle poor' as strongly, or more strongly than those whose lifestyles seldom brought them into direct contact with such people. They had long ceased to consider themselves members of 'the poor'. They were, in their own minds, closely allied with the gentry and, through their networks of associates and friends this perception was continuously reinforced.

As is all-too-often true in such situations, those who subconsciously sensed that they could easily be lumped together with people they considered hierarchically inferior to themselves, strongly emphasized the differences, emphasizing the negative stereotypes of those from whom they wished to be separated ¹⁴⁰.

The 'little gentry' of the 18th century were strong in their denunciations of people who seemed to expect the parish to support them. Why should the parishes, and therefore, people who provided the parishes with their income, support the lazy poor who were, in growing numbers, relying on parish support for their subsistence?

Paradoxically, as these people found their own livelihoods under threat they more strongly resented the costs of supporting the indigent. They were not presuming that some day they also might need parish help - the specter of being forced into the ranks of the poor was, for these people, one they could scarcely contemplate. Rather, their own difficulties were best addressed through minimizing the demands of the parish on their own incomes.

As the reformers set about rationalizing land ownership and use, these people found themselves caught up in the consequences of the policies. Rural laborers and small holders were dispossessed and driven from the land and the infrastructural supports sustained by them collapsed.

As is true in the present in countries all around the world, as rural communities disintegrated, both those directly affected by the reformist policies of the century and all those who depended on them for their subsistence, found their livelihoods collapsing and found themselves no longer able to subsist in the countryside. As they lost their means of livelihood they found themselves defined with the poor by the authorities, rather than recognized as members of a disenfranchised 'lower middle' ranking in society. Toynbee (1884) described it all:

at the conclusion of the 17th century it was estimated by Gregory King that there were 180,000 freeholders in England,... less than a hundred years later, the pamphleteers of the time, and even careful writers like Arthur Young, speak of the small freeholders as practically gone...

'The able and substantial freeholders,' described by Whitelock, 'the freeholders and freeholders' sons, well armed within with the satisfaction of their own good consciences, and without by iron arms, who stood firmly and charged desperately,' - this devoted class, who had broken the power of the king and the squires in the Civil Wars, were themselves, within a hundred years from that time, being broken, dispersed, and driven off the land.

The 18th century was a century of wealth and well-being for the middle and upper ranks of society but, as Toynbee (1884) says, in the midst of all the wealth and prosperity which began in the 18th century, there were vast numbers of destitute people. The later 18th and 19th centuries were to demonstrate that unfettered competitive self-interest does not necessarily produce the *Summum Bonum* ¹⁴¹.

Wendeborn, a German living in England during the second half of the 18th century described what he saw,

In no other country are more poor to be seen than in England, and in no city a greater number of beggars than in London. A foreigner who hears of many millions annually raised for the benefit of the poor... will

find himself unable to explain how it happens, that in his walk he is, almost every hundred yards, disturbed by the lamentations of unfortunate persons who demand his charity.

(quoted in Simon 1908 p.60)

As the 18th century unfolded, those people in the lower-middle ranks of British communities ¹⁴² looked for support and help from those whom they had long considered their superiors and community leaders. All-too-often, they found not only no support, but an active rejection of them and the difficulties they faced. They seemed to have been condemned by those they sought to emulate to a life of fear and possible destitution.

These 'almost poor', 'almost middle ranking' people knew that their only hope of avoiding the destitution which was all around them lay in being accepted, and so being supported by the middle ranks who seemed to be escaping the worst consequences of the reforms of the era. They both deeply wanted to be accepted by them and, at the same time, felt a deep need to be identified as *not* belonging to the pernicious ranks of the slothful.

They were not vagabonds and wastrels. They took life seriously and wanted nothing more than to be recognized as morally upright, desirous of owning and conserving property and willing to engage in work to that end. They had already adopted, or were more than willing, if they could find employment, to adopt "those habits of industry, which always tend to steadiness and sobriety of conduct, and to consequent material wealth and prosperity" (Codere 1950, p. 24).

They found the means of achieving both of these heartfelt longings in the religious revivals which swept Britain and the American colonies (soon to become the United States) through the 18th and on into the 19th century. The religious revivals were to provide a means for lower-middle ranking people to demonstrate and reaffirm their respectability.

Nothing reduces human beings to greater despair and distress than threat of the imminent loss of not only the means of livelihood but of self-esteem and status. The lower middle ranks of the 18th century found themselves facing possible destitution and treatment as though they belonged with those who, as Joseph Townsend (1786) described them later in the century, had

by their improvidence, by their prodigality... drunkenness and vices, ... dissipated all their substance... by their debaucheries... ruined their constitutions, and reduced themselves to such a deplorable condition that they have neither inclination nor ability to work. ¹⁴³

There seemed no way out, no way in which they could reassert their status and respectability and demonstrate their commitment to industry and to all the associated 'middle sort' moral virtues of the century.

Then, seemingly out of nowhere, they were thrown a lifeline. Preachers, clearly members of the gentry, began travelling the country, offering them acceptance, legitimacy, and the possibility of banding together into societies of disciplined, industrious, moral people. They flocked to hear them and to commit their lives to their causes in the hundreds of thousands. At meeting after meeting, they expressed their heartfelt relief at the possibility of redemption, of committing themselves, unreservedly, to a life of industry and frugality, of religious and moral discipline and virtue ¹⁴⁴.

Born-Again to Industry: the Conversion of the Little Gentry

The preachers were bemused both by their own success in attracting such crowds to hear them speak, and by the depth of the emotional response to their message. Time and again, to messages as prosaic as many of the ^œ[sermons of John Wesley](#), people lost emotional control, falling to the ground, crying uncontrollably, losing control of their faculties. And the fervor with which they sang the songs of the revival was a testimony to the depth of their despair and their revived hope for the future.

In the early to mid 18th century the middle ranks increasingly confused money-making and religious ideals. More and more of them justified themselves through involvement in money-making activities and the churches, which had been so strong in the 17th century, found it difficult to attract and hold members ¹⁴⁵.

At the same time, the minority who took their religion seriously felt increasingly ill at ease with the worldliness and materialism of the age and felt themselves burdened with a responsibility of their own to maintain their spiritual focus. John Wesley, as a young man in 1734, expressed it well in writing to his father,

I take religion to be, not the bare saying of so many prayers, morning and evening, in public or in private; nor anything superadded now and then to a careless or worldly life; but a constant ruling habit of the soul; a renewal of our minds in the image of God; a recovery of the Divine likeness; a still increasing conformity of heart and life to the pattern of our most Holy Redeemer.

(quoted in Harrison, 1942, p. 17)

Through the 18th century, in the face of what such people saw as a constantly increasing hedonistic materialism among the affluent middle ranks, they held to their faith and brought it to those who were prepared to listen. But, of course, they carried within them the understandings of their time and of their social ranking.

As historians have stressed over the years ¹⁴⁶, the religious revivals of the 18th century were conservative, not radical in orientation. The disciplines imposed on and accepted by the converts have been viewed as repressive and restrictive. Yet, as we will see, these were the very features which resulted in its enormous influence over the subsequent three hundred years in, first, English speaking countries and communities, and then, through the subsequent efflorescence of capitalism, in much of the rest of western Europe.

It was one of the early concerns of the Wesley brothers and other members of the 'Holy Club' at Oxford (from which many of the preachers came) that they too easily succumbed to laziness, a great 'weakness of the flesh', when God wanted them to 'employ their time profitably'. Industry and frugality, as John Wesley was to repeat time and again, are the inevitable outcomes of true godliness.

The following advice to his followers, in a tract published in 1762, providing instructions for daily living to those who belonged to Methodist Societies, is typical of his views on the subject,

Be active. Give no place to indolence or sloth; give no occasion to say, 'Ye are idle, ye are idle.' Many will say so still; but let your whole spirit and behavior refute the slander. Be always employed; lose no shred of

time; gather up the fragments, that nothing be lost. And whatsoever thy hand findeth to do, do it with thy might. ¹⁴⁷

If human beings found themselves destitute, if they felt that God had abandoned them, they had only to commit their lives to Him and live as He had intended them to live. This would inevitably result in God's blessing. The demonstration of one's commitment to God was the diligence with which one applied oneself to 'one's calling'. If one was called to preach, then preach one must. If one was called to ply one's trade, then ply one's trade 'as unto God'. As Wesley put it, "Religion must necessarily produce both industry and frugality, and these cannot but produce riches." (quoted in Thompson 1980, p. 391)

In the 18th century, for both the religiously committed and for the majority of more loosely religious people of the middle ranks, progress was closely tied to God's plan for the world. Those who lived by his precepts, through their commitment and dedication, would ensure that the future would be that which He had planned. To show weakness in the face of unrepentant immorality was to endorse such behavior. One rejoiced 'with the Angels at one sinner brought to repentance', but one thundered the wrath of God to those who willfully refused His grace.

The century saw many very successful evangelists carrying this message to the 'lost'. It was, however, John Wesley, a man who knew that God had a plan for the world and that His plan could only be worked out through people who dedicated themselves to ensuring it, who was to fashion the doctrinal base for evangelical Protestantism over the next two hundred years. He was, in their hundreds of thousands, to 'convert' the deeply threatened lower-middle ranks to 'Methodism' ¹⁴⁸. In doing so, he was also to set the scene for the 'Victorian morality' of the next century.

In the 16th and 17th centuries, emphasis on the freedom of the individual from domination by both political and religious bureaucracies had led, in some instances, to anarchy, to an *anti-law* (antinomian) view of the rights of the individual. Since the individual was saved by grace, any attempt to merit God's favor through 'works' countered the grace of God. So, it was, in the most extreme forms of antinomianism, argued that the individual could display the depth of the grace of God through ignoring or contravening both moral and social rules and regulations.

In reaction to this, Luther, Calvin and other protest leaders of the 16th century emphasized the importance of civil law and order, and required their followers to live closely regulated lives. Nonetheless, the evils of the centuries were commonly believed to be a consequence of this lawless strain in extreme forms of Protestantism.

By the turn of the 18th century the common teaching was that, while individuals were saved by grace through faith, this salvation was demonstrated in the life of the individual through the Christian's 'blameless' life - as Jesus had said, "By their fruit you will recognize them" (Matthew Ch. 7 Verse 16). Wesley, as a consequence both of his family's experiences while growing up and of his own disputes with antinomian pietists and Calvinist dissenters, developed a theology which, while perhaps not as consistent as those of earlier protestant leaders, nonetheless directly addressed what he perceived to be fundamental weaknesses of both antinomianism and Calvinism.

Calvinists stressed the Divine prerogative in salvation. Since people were saved by grace, not works, no person could *do* anything to gain salvation, it

was a 'free gift of God'. If people had to believe in order to be saved, they had to perform a 'work', that of actively believing. To get around this problem, Calvin had argued that God had, from the time of creation, 'elected' those to be saved. All that happened when people became religiously 'awakened' was that they became aware of what had already happened.

This awakening did not bring about their salvation, they simply became conscious of the salvation which God had accomplished 'before the foundation of the world'. Because they now knew they were among the elect, they delighted to do the will of God. Any person who was truly one of the elect, once he or she realized this, would, in thankfulness to God, want to live to please him. By their lives they would show that they really were among the elect. Of course, the flaw in this was that if people were destined to be saved, no matter what they did, then the door was always open to antinomianism.

Wesley, as a confirmed high church Anglican, was brought up in a religious environment in which faith and works went hand in hand. One showed one's faith through membership of the church, and one 'worked out one's salvation with fear and trembling'. The danger of this approach was, of course, the one which the Calvinists sought to avoid through the doctrine of election. People could be seen as 'earning' salvation through their works - the papist doctrine which Protestants claimed had brought about the Reformation in the first place.

Wesley's solution, while perhaps logically flawed, was nonetheless persuasive for ordinary people not embroiled in the intricacies of theology. First, people were saved by God's grace, through the active exercise of their free will. This was the only 'work' that any person could do to merit salvation. No form of morality, no form of legal rectitude, no membership of any religious body could bring a person to salvation. They merely exercised their 'free-will' in deciding whether or not they wanted to be saved.

When the person approached God in this way, He always accepted them. As a hymn of the period put it - "Only Believe, Only Believe, all things are possible, Only Believe". So, there were no 'elect', with the rest of humanity damned whether they liked it or not.

When people, aware of their utter helplessness and sinfulness, approached God, He gave them a 'new life', they were 'born again'. It was no longer them, but 'Christ in them'. They were given the 'Spirit of Christ' and from that point on *could* please God by their works, since they were not their own works, but the works of 'Christ in them, the hope of glory'. They were on the path to sanctification. Their hearts having been reoriented to God, they were being "transformed by the renewing of their minds".

As Kathryn Long has put it, speaking of attitudes reflected in the religious revivals of that century in 19th Century United States,

the stress on personal piety confirmed long-standing convictions that the only true path to social change came through individual conversions.

(1998 p. 107)

However, Wesley felt the need for some stronger reason for living lives 'acceptable to God' than an individual desire to be sanctified. Not only were people saved through an act of faith, they could also be lost through an act of will. The person who did not live to God, lived to self and, therefore, gave

room to evil. This was why one had to 'work out one's salvation with fear and trembling'.

Wesley was to teach, for more than half a century, that while individuals were saved by grace through faith, and could not begin to please God until they had been 'born again', they could also commit spiritual suicide by failing to live as God intended them to. Such people had 'the form of godliness but denied the power of it'. When these people who were 'neither hot nor cold' were found within a community of Christians they should be expelled. Christians had a duty to discipline one another.

Those who were not "pressing on toward the goal" of the renewing of their minds, were 'backsliding'. And Christians could recognize such people. As Jesus had said,

By their fruit you will recognize them... Not everyone who says to me 'Lord, Lord', will enter into the kingdom of heaven, but only he who does the will of my Father who is in heaven.
(Matthew 7: 16, 21)

So, one either pressed toward the goal, or one was in danger of being rejected by God - and, if by God, then also by Wesleyan Christians.

The theology might have been shaky, but the motivational message was forceful. It proved hugely successful in motivating those who accepted the message on both sides of the Atlantic over the next two hundred years.

By the end of the 18th century they would become a major religious, economic and political force within Britain and the emerging United States of America, deeply dedicated to industry and frugality, to the principle of "whatever your hand finds to do, do it with all your might". And it was they, not the financiers, bankers, and landowners of the country, who provided the engine for what was, indeed, to be an 'industrial revolution' which would set Britain and her transatlantic offspring on course to world empire and economic domination in the next centuries.

In a century when the moral commitment of the gentry to industry and frugality faltered, and might well have died, a new kind of 'gentleman' emerged, religiously dedicated to the unending pursuit of wealth and property, and to innovative production.

Born Again Manufacturers and Retailers

The religious organizations which grew from the revivals or were transformed to accommodate them, provided these people with an ongoing means of deeply reaffirming the values which their 'conversions' had affirmed. Through them, they could re-establish the networks of respectability in which they had been brought up, and promote those values as essential to salvation for all human beings.

They *knew* that 'but for the grace of God', they too would have found themselves counted among the destitute of the century. They also quickly learned, through the preaching and teaching of the itinerant evangelists who were their leaders and mentors, that, having been saved by grace, through faith, they had begun lives of discipline and commitment to all the virtues of the century.

The Wesleyan Methodist societies, classes and bands provided the clearest model, but what John Wesley built up over more than fifty years in England was replicated with modification by many other evangelists not only in

England but through Ireland, Wales, Scotland and the American colonies¹⁴⁹. The religious revivals of the time were, largely as a result of Wesley's vision, strongly organized, with the redeemed encouraged to long-term discipline and direction by their peers and leaders.

The deep, emotional nature of their conversion, based on a commitment to the moral values of those who brought the possibility of redemption to them, resulted in them being far more committed and determined to live by the understandings of the century than those who, till this time, had been the major promoters of modern values. By the mid 19th century, the religious revivals of Britain and the United States were overtly focused within the newly successful middle ranks of the population.

The 1858 revival in New York sprang from "a weekly prayer meeting for businessmen" (Long 1998, p. 13). Those involved in the religious 'awakenings' which recurred over more than a century on both sides of the Atlantic from the early 1730s onwards, became, over the next two centuries, the moral center, the 'moral majority' of the western communities in which they lived.

They were convinced that only through faith and reliance on 'the grace of God' had they escaped catastrophe, committed to living by both moral and economic laws and convinced, as Kant explained, that

All the culture and art which adorn humanity, the most refined social order, are produced by that unsociability which is compelled by its own existence to discipline itself, and so by enforced art to bring the seeds implanted by Nature into full flower.

When they sang "Amazing grace! How sweet the sound that saved a wretch like me", they meant it with every fiber of their being.

The 18th century had launched a new, emotionally committed, community of capitalists. The driving force of the 'industrial revolution' was to come, not from the financiers and well-established gentry of the era, but from those who had been redeemed to be productive.

The term 'Methodist industrialist' was, by the early 19th century, a common descriptor for those who took both their religion and their productive enterprise seriously. They established factory towns and day schools and were concerned not only with money-making, but also with the moral development of those they employed.

Andrew Ure, in 1835, speaking of Richard Arkwright's¹⁵⁰ contribution to the emergence of the industrial factory explained this:

What his judgment so clearly led him to perceive, his energy of will enabled him to realize with such rapidity and success, as would have done honour to the most influential individuals, but were truly wonderful in that obscure and indigent artisan...

The main difficulty did not, to my apprehension, lie so much in the invention of a proper self-acting mechanism for drawing out and twisting cotton into a continuous thread, as in the distribution of the different members of the apparatus into one cooperative body, in impelling each organ with its appropriate delicacy and speed, and above all, in training human beings to renounce their desultory habits of work, and to identify themselves with the unvarying regularity of the complex automation.

To devise and administer a successful code of factory discipline, suited to the necessities of factory diligence, was the Herculean enterprise, the noble achievement of Arkwright.

(The Philosophy of Manufactures, 1835)

The revivals of the 18th century shared little with the cerebral, theological drive for religious reform which had brought 16th and 17th century protestant groups into being. They were 'charismatic', as that term has come to be used of similar movements in the 20th and 21st centuries.

Those who were 'saved', displayed all the passion for salvation and for recognition one might expect from people who felt themselves trapped and destined to be treated as what they were not. And they accepted and determined to live by the precepts and directives of their spiritual mentors.

Their mentors reaffirmed the presumptions of capitalism. As Whitefield, one of the very successful evangelists of the century on both sides of the Atlantic explained,

Nothing tries my temper more than to see any about me idle; an idle person tempts the devil to tempt him... if anybody says the Methodists [followers of the Wesley brothers] teach to be idle, they injure them. We tell people to be at their work early and late, that they may redeem time to attend the word. If all that speak against the Methodists were as diligent, it would be better for their wives and families. What, do you think a true Methodist will be idle?
(quoted in Armstrong 1973, p. 123)

A New Moral Leadership and Support Network

The Methodist movement of the 18th century found its leadership, not in the dissenting churches, descendants of the puritanical, protestant movements of the 16th and 17th centuries, but in the established Church of England. And, although the hierarchy of the state church seemed reluctant to be associated with such enthusiastic Christianity, the leaders of the movement were, largely, committed to ensuring that their converts remained within the Church. So, for more than fifty years, the tightly organized and disciplined Methodist societies remained religious communities connected to the parishes of the state church.

This prolonged association did more to convince dedicated Methodists of the worldliness and lack of moral leadership in higher levels of society than almost anything else could have. Since the Anglican clergy were appointed by the Anglican hierarchy, local communities had little influence over those selected to lead them. Very often, they found themselves having to endure leadership which seemed almost inimical to the lives they had committed themselves to leading. As Archibald Harrison put it,

The Methodists themselves were increasingly reluctant to attend services conducted by clergy with no apparent interest in spiritual religion, and, too frequently, with reputations far below the standards of the gospel it was their business to proclaim.
(1942, p. 169)

They became increasingly convinced that they, themselves, would have to provide the moral leadership they sought. They could not look to their social superiors for moral direction. Rather, they could expect that those above them would, at best, display a lukewarm attitude to the moral virtues.

For these 'born again' Christians, the 'upper middle ranks', together with the aristocracy, were largely composed of people who, as Paul had explained to Timothy (2 Tim. 3:5), held "the form of religion but denied the power of it." Wesley had no hesitation in endorsing Paul's advice, "Avoid such people". He provided his own description of their shallowness, "So much paint and affectation, so many unmeaning words and senseless customs among people of rank" (quoted in Armstrong 1973, p. 88).

Those 'born again' in the 18th century revivals became the guardians of morality and prosperity. So dominant did they become that the virtues they espoused and promoted became the virtues of more than a century of middle ranking people. Even those who were, in truth, part of the earlier gentry, largely untouched by the religious revivals, found themselves having to publicly endorse the virtues. And born-again Methodists knew, with a conviction confirmed by experience, that if they did not hold the moral center, no one would.

The stern nature of the discipline they imposed on each other was tempered by social responsibility for those who repented and joined their ranks. The societies and classes of Methodism were not just religious groupings, they took moral, social and economic responsibility for each other. In doing so, they formed strong support networks, providing a social and economic refuge for people who saw the world closing in on them. As Armstrong described,

The societies helped the poor among their members - it was one of the duties of the stewards to arrange such relief. The maintenance of a

'lending stock' by the societies meant that loans of from one to five pounds could be made to poor members on the recommendation of the borrower's class leader.

(1973, p. 88)

This approach to the problems of the poor in their ranks is very similar to some of the 'pump priming' activities of 'credit banks' over the last forty years in 'developing' areas. The primary difference is that the pump priming lending of Methodist societies went to people who were already oriented to capitalist endeavor and whose activities were overseen by others of similar bent.

The lending did not produce the capitalist orientation, as some credit societies seem to presume will happen in Third World communities. Rather, it facilitated small business activity for people already aware of the need for frugal industry, the deferment of short term rewards for long term gain, and intent on the accumulation of capital as a means of demonstrating their inherent morality ¹⁵¹.

Methodists did not develop small scale credit societies among the unredeemed poor as a means of stimulating small business among them. They knew that money lent to such people would be spent on present needs and wants, not used to make more money.

In fact, many of those who were 'saved' from the ranks of 'the poor', failed to remain within the societies. They quickly proved themselves unreliable borrowers, who could not be trusted to use the money given them 'wisely' and, consequently, fell short of the moral requirements of the communities in which they found themselves.

The Methodists, quite unconsciously, selected people of like temper, those who were already committed to the middle ranking virtues of the century. Those whose background was among the 'poor' seldom demonstrated the long term 'habits of industry' which ensured acceptance.

Not only was this kind of support given within Methodist societies to help members out of poverty, it was also seen as a means of ensuring that they remained committed to Methodism. The networks of Methodism provided strong business support to small business people. Those who found themselves expelled from a society because they failed to measure up to the spiritual and moral requirements of the group, often found that their businesses suffered once they no longer had access to the networks through which their business activity had been established.

John Wesley, ever a practical leader, realized the power which such support had in ensuring that people remained committed to the cause, or were drawn back to commitment through being helped in this way. In a letter to the Methodist Society at Keighley, London, in 1779, he describes the financial difficulties into which a former member of the Society had fallen.

The person concerned, one William Shent, had for many years been a faithful member of the Society, but had been disciplined some time earlier and expelled for not living up to the moral requirements of membership. With support from the group removed, his business activities fell apart and he and his family were now in danger of being evicted from their home. Wesley wrote,

Who is he that is ready now to be broken up and turned into the street? William Shent. And does nobody care for this? William Shent fell into sin and was publicly expelled from the Society; but must he

also starve? Must he with his grey hairs and with all his children be without a place to lay his head?...

Who is wise among you? Who is concerned for the Gospel? Who has put on the bowels of mercy? Let him arise and exert himself in this matter. You here all arise as one man and roll away the reproach. Let us set him on his feet at once. It may save both him and his family. (Brash 1928, p. 105)

It is in this group of religiously committed capitalists that one must look to find the capitalist spirit of the 19th century, that spirit to which the British prime minister Margaret Thatcher referred when she claimed, in the late 1970s, that British people should revive the moral values of the previous century.

The superficial charge laid against 19th century middle ranking people, that their morality was largely hypocritical, only holds if one fails to recognize the large number of fellow travelers who came under the influence of Methodists and members of those dissenting Churches which were reinvigorated through participation in the 18th century religious revivals. It is a testament to the social force of the movement, that the values of those saved by grace in the 18th century, became the values of an age.

Of course, although the religious revivals of the 18th century produced a morally committed middle class of capitalists, *they brought their values with them* into the revival. The revival preachers and teachers of the 18th century strongly reaffirmed the important moral values of the middle ranks of western European communities. Those from the lower middle ranks, who found themselves most directly threatened by the reforms of the period, were drawn to leaders who offered them both recognition and practical support.

In a time when little distinction was being drawn between the poor and the lower middle ranks, reformers set out to teach the lower ranks the importance of work. In the process, those who were converted developed strong, religiously reinforced support networks which enabled them to succeed in business in a way that had not been possible in earlier times.

Wesley summed up the impact of Methodism on the lives of his followers in a sermon toward the end of his life,

The Methodists grow more and more self-indulgent, because they grow rich. Although many of them are still deplorably poor... yet many others, in the space of twenty, thirty or forty years, are twenty, thirty, yea, a hundred times richer than they were when they first entered the society. And it is an observation which admits of few exceptions, than nine in ten of these decreased in grace, in the same proportion as they increased in wealth. Does it not seem (and yet this cannot be) that Christianity, true scriptural Christianity, has a tendency to destroy itself?

(quoted in Armstrong 1973, p. 95)

While the Methodists took their religion seriously, all their energies were focused on life within this world. The religious virtues they promoted were capitalist virtues from the 17th century, shaped by the understandings of the 18th. They lived in an age when self-interest and the private accumulation of wealth and property were assumed to result in the *Summum Bonum*. As Appleby has explained,

Where earlier the disposal of a harvest or the pursuit of a trade had been conditional upon the likely social impact, the acceptance of near-absolute property rights had driven a wedge between society and the economy. With the curtailment of political oversight over economic life, the formal link between the material resources of the country and the people to be sustained by them had been cut. The commonwealth had become an aggregation of private wealth.

(Appleby 1978, p. 151)

Good Methodists knew that self-interested private enterprise, driven by a deep commitment to industry and frugality, and resulting in the private accumulation of wealth, were virtuous. As Harrison says,

The Wesleyans were particularly numerous among the shopkeepers, farmers, and better-class artisans... In some cathedral cities nearly all the shops in the High Street would be Methodist shops and a great Wesleyan congregation would gather under the very shadow of the Cathedral... In big business and in Northern factories, too, Wesleyan Methodism was prominent and grew in wealth in the prosperous years. (1942, p. 180)

As Methodists grew wealthy they found themselves able to emulate the lifestyles and become accepted by the middle sorts with whom they had long desired to be identified. Methodism provided a moral leavening to the 19th century. In the process, the 'old money' middle ranking families took on a veneer of 'morality' which enabled the 'new money' Methodists to interact with them without seeming to betray their Methodist values. The values of the two groupings slowly merged. In business one emphasized disciplined self-interest. In social life one accepted philanthropic responsibility for the 'improvement' of the poor.

By the 19th century, Methodists and others belonging to communities which came out of the 18th century revivals were dominant in both manufacturing and retailing. Those who were the descendants of 17th and 18th century gentry very often provided the finance for the more extensive of their activities. As Andrew Ure (1835, pp. 20,1) described, while explaining the emergence of factories in the late 18th century,

In its precise acceptation, the Factory system is of recent origin, and may claim England for its birthplace. The mills for throwing silk, or making organzine, which were mounted centuries ago in several of the Italian states, and furtively transferred to this country by Sir Thomas Lombe in 1718, contained indeed certain elements of a factory, and probably suggested some hints of those grander and more complex combinations of self-acting machines, which were first embodied half a century later in our cotton manufacture by Richard Arkwright, assisted by gentlemen of Derby, well acquainted with its celebrated silk establishment.

From the outset, as Brash (1928, p. 179) says, "Methodism was an army of missionaries". Every convert was a potential evangelist, every society and class accepted an evangelical mission to 'the lost'. Those who were at the forefront of the religious revival movements in Wales, England, Ireland, Scotland and in the various American colonies, believed they had been directly chosen by God. They had His mandate to "bring sinners to repentance", and if they failed, the damnation of those they had failed to reach would be their responsibility. They *knew* that the warning God had given Ezekiel was theirs also,

... if the watchman sees the sword coming and does not blow the trumpet to warn the people and the sword comes and takes the life of one of them, that man will be taken away because of his sin, but I will hold the watchman accountable for his blood.
(Ezekiel 33:6)

Equally, they accepted the responsibility that Wesley had made his own. They not only 'saved' the lost, they *organized* them into churches and communities, and they introduced the disciplines of 18th and 19th century Methodist Christianity and economic rationality to those they organized in these ways. They had the responsibility not only to bring salvation to the lost, but, in the process, to bring them civilization and consequent material prosperity.

Richard Whateley, Archbishop of Dublin, in 1854, explained the problem,

Men, left in the lowest, or even anything approaching the lowest, degree of barbarism, in which they can possibly subsist at all, never did, and never can raise themselves, unaided, into a higher condition
[152](#).

Because all human beings were sinners, and because 'enlightenment' depended on the grace of God, not only were people 'saved' from perdition, they were also, inevitably, saved to a new way of life, to a higher level of civilization than they could ever reach on their own. They were, by God's grace, and by the disciplines of their churches, delivered from lives of sloth and indigence into lives of industry and prosperity. Through this they would

overcome the present disposition either to sloth or to enjoyment. This habit is slowly acquired, and is in reality a principal distinction of nations in the advanced state of mechanic and commercial arts.
(Ferguson 1767 Part 2, Section 2)

As Herbert Schlossberg described,

In 1837 a clergyman in Leeds remarked that

the most established religion in Leeds is Methodism, and it is Methodism that all the most pious among the Churchmen unconsciously talk,

That is, Methodism, which by then had separated from the Church of England, had come to dominate the thinking of the city to the extent that even Anglicans had been swallowed up in its spirit, albeit without realizing it...

The "secular" 18th century, when we look beneath the surface, turns out to be the start of a profound spiritual revival. As it spread from the Church of England throughout the society, it affected the life of non-Anglican, or Dissenting, congregations. The chapels in which the dissenters worshiped increasingly rang with the ideas and hymns of the evangelical movement.
(2000, pp. 8, 10)

By the mid 19th century, Methodism would become the leavening of Victorian Britain. From the high, to the lower-middle, to the artisanal 'working class' (but seldom to the 'idle poor'), the British increasingly committed themselves to the understandings of Methodism, to a religiously invigorated capitalism.

The American War of Independence resulted in a hiatus in direct influences from Britain to the American colonies. The revival in Britain preceded a

similar movement in the colonies by some thirty to forty years. The missionaries of the British 'Awakening' proved most effective as the colonies settled down and law and order were reimposed under the new United States administration.

As Mary Cayton (1997) explained, between 1794 and 1832 thousands of converts streamed into the non-conformist churches of British North America, and, as in Britain, the bulk of those who committed themselves to an active religious life were involved in petty-business. As Cayton said,

Especially in the Northeast, then rapidly being drawn into a net of complex market relationships, those entering upon the responsibilities of adulthood but also many of other life stages, and members of an emerging entrepreneurial class but also those of other stations and callings, were caught up in intensified religious expression.

They experienced conversions, joined organizations designed to promote a host of benevolent causes, and swelled church rolls. They were Congregationalists and Presbyterians, Baptists and Methodists, and together they comprised a movement that historians in retrospect have called the Second Great Awakening.

First The Poor, Then The World! 🌍

What started in Britain, very quickly reached outward to the whole world. Those who entered the movement in the 18th century knew that there were no geographical boundaries to bringing sinners to repentance. With Wesley, they asserted that the world was their parish.

Out of the 18th century religious revivals came the evangelical missionary movement of the 19th and 20th centuries. And, as they moved into the world, they took their Western European lower middle class values with them. As Cairns has described of missionary attitudes in central Africa in the 19th century,

The proper attitude was indicated by Carson of the L. M. S. [London Missionary Society] who, after noting that African men spent 'much time in indolence', remarked that it was inconceivable 'how the practice of that vice in the African race can be supposed to conduce to happiness in them when it makes us so miserable'.
(1965, p. 80)

Those who were 'born again' should, in the minds of these missionaries, be born into frugal, self-disciplined industry, into conserving possessions, into accumulating wealth, and into using the wealth they accumulated 'wisely'.

They took capitalism to the world. And, since people in other communities seemed to have so little internalized discipline, so little regard for prudent, productive endeavor, they realized they had a responsibility to discipline and train them.

Out of missionary endeavor among the poor, among the destitute in western Europe, and out of similar activity among the 'benighted' of other regions, came a strong belief in the need for practical education to teach converts to live as 'God had intended them to live'.

But, despite all its success in the Anglo-speaking world, and the extensive network of societies and churches which sprang from the movement, very few of those on the lowest rungs of the social order were drawn into the revival movement. The redemption of the lower middle rankings of British

and North American communities still left large numbers of poor dispossessed and cast adrift in the century, relatively untouched by the revivals which had swept their countries.

The redemption of the artisans, tradespeople and small holders of the century did not predispose them to accepting the irreligion and laziness of the poor. It made them resolute in doing something about 'the problem'. They did not have to look far to find those who constituted it. They were on their own door step, a group of people who defied all law and morality. James Kay (1832) described the lower classes inhabiting a district in Manchester,

This district has sometimes been the haunt of hordes of thieves and desperados who defied the law, and is always inhabited by a class resembling savages in their appetites and habits. It is surrounded on every side by some of the largest factories of the town, whose chimneys vomit forth dense clouds of smoke, which hang heavily over this insalubrious region.

Capitalism was in full bloom! It was time for the new moral capitalist leaders of Britain to tame and civilize the hordes of thieves and desperadoes which lived on their own doorsteps. And they set about it with all the determination they had employed in building their new industrializing world.

Chapter 5: The Virtuous Capitalist, The Poor and the Wasteland †

[Factory Workers] pamper themselves into nervous ailments by a diet too rich and exciting for their in-door occupations
(Andrew Ure 1835, p. 298)

Bubbles and Wasteland

Who were 'The Poor'?

- Who's to blame for their poverty and degrading circumstances?

What shall we do with The Poor?

- The Poor are lazy with no desire to 'Better Themselves'!
- Born Again or Not - They need to Learn Discipline!
- They'll work if they're hungry!
- We'll Compel Them through Laws and Regulations!
- Let's Train their Young
- And ... No Charity!!

Don't allow them to organize - it's Bad for Them!

- Organizations of Artisans
- Organizing the 'Working Poor'

Conclusion

Bubbles and Wasteland

The trader, in rude ages, is short-sighted, fraudulent, and mercenary; but in the progress and advanced state of his art, his views are enlarged, his maxims are established: he becomes punctual, liberal, faithful, and enterprising; and in the period of general corruption, he alone has every virtue, except the force to defend his acquisitions. He needs no aid from the state, but its protection; and is often in himself its most intelligent and respectable member.

Adam Ferguson (1767 Pt 3, Section 4)

Ferguson's description of 18th century Western European gentry in the 2nd half of the 18th century is in stark contrast to Thomas Jefferson's description,

...they have divided their nations into two classes, wolves and sheep. I do not exaggerate. This is a true picture of Europe. ...man is the only animal which devours his own kind; for I can apply no milder term to the governments of Europe, and to the general prey of the rich on the poor.

(Thomas Jefferson, 1787 ¹⁵³)

Jefferson was a visitor to Europe and his reaction is that of a relatively detached outsider witnessing the consequences of the enlightened self-interest of the gentry: injustice and oppression of those least able to defend themselves - the poor.

Ferguson was a Scottish gentleman. He had lived inside the bubble of middle class Western European society all his life and saw everything outside that bubble as a wasteland which needed to be reclaimed.

If that wasteland was to be reclaimed, its inhabitants rescued from poverty, moral depravity and sloth, it would be because the gentry set the example and took responsibility both for 'developing' their environments and for re-educating the indolent poor. Those who practised enlightened self-interest did so for the most moral of reasons. They were securing the future for everyone. They needed protection from the state to ensure that all the benefits which flowed from enlightened self-interest were realized ¹⁵⁴.

The wasteland was a 'nursery for thieves and villains'. They were poor because they were indisciplined and lazy, not because of the rapacious greed of the gentry! ¹⁵⁵ The poor lacked the virtues that had become natural to the gentry.

When middle ranking people looked at a gentleman they saw a virtuous man. Adam Smith, in a book appropriately entitled *The Theory of Moral Sentiments*, explained it well. It was from the realization that such people were securing the future for everyone in society that there,

arises that eminent esteem with which all men naturally regard a steady perseverance in the practice of frugality, industry, and application, though directed to no other purpose than the acquisition of fortune. The resolute firmness of the person who acts in this manner, and in order to obtain a great though remote advantage, not only gives up all present pleasures, but endures the greatest labor both of mind and body, necessarily commands our approbation. ¹⁵⁶

(1759 Part 4 Ch. 2)

Such people did not merely pursue prudent self-interest for their own gain or because others insisted they should. They knew, in their own hearts, that prudent, self-interested industry and frugality were amongst the most important of the virtues:

In the steadiness of his industry and frugality, in his steadily sacrificing the ease and enjoyment of the present moment for the probable expectation of the still greater ease and enjoyment of a more distant but more lasting period of time, the prudent man is always both supported and rewarded by the entire approbation of the impartial spectator, and of the representative of the impartial spectator, the man within the breast.

(Smith 1759, Part 6 Section 1)

The 18th and 19th centuries were the centuries in which capitalism was to flourish, unfettered by laws and regulations. It was to be the period when the long-term impact of unregulated capitalism on the living conditions of the poor would become obvious.

What would happen to the least fortunate, to the inhabitants of the wastelands, when the 'steady perseverance in the practice of frugality, industry, and application, though directed to no other purpose than the acquisition of fortune' was allowed full play?

Who were 'The Poor'? 🐼

They were the dispossessed, inhabitants of the wastelands of Western Europe. They were the rubble of feudal society. For them, feudal understandings ¹⁵⁷, inevitably warped and altered by the centuries of turmoil, confrontation and change in western Europe, were still central.

But, the patron-client structures of the feudal past were gone. There were no patrons on whom they could rely, no institutional supports which might protect their rights. They had lost those over more than three hundred years of feudal decay and collapse. They had become

hordes of thieves and desperados who defied the law ... a class resembling savages in their appetites and habits
(James Kay (1832)).

Thomas More had described their plight two centuries earlier, when their patrons resolved 'to enclose many thousand acres of ground'.

... [T]he owners as well as tenants are turned out of their possessions, by tricks, or by main force, or being wearied out with ill-usage, they are forced to sell them.

By which means those miserable people, both men and women, married and unmarried, old and young, with their poor but numerous families (since country business requires many hands), are all forced to change their seats, not knowing whither to go; and they must sell almost for nothing their household stuff, which could not bring them much money, even though they might stay for a buyer.

When that little money is at an end, for it will be soon spent, what is left for them to do, but either to steal and so to be hanged (God knows how justly), or to go about and beg? And if they do this, they are put in prison as idle vagabonds
(1516, ^œ*Utopia* , Book 1)

Not much had changed in two centuries!

They were the dispossessed of Western Europe, the weak who could not defend themselves against patrons turned capitalist (or, as Jefferson put it, 'turned wolf'). They constituted separate communities from the gentry, money makers and aristocracy of Europe, only connecting with them as menials, laborers, vagabonds and thieves. They had not socialized with or shared the [interests and understandings of the middle ranks](#). The gentry, with their distinctive ways of living, moved in social spheres beyond their vision, and, largely, beyond their interest.

Among the more intemperate descriptions of these people is that given by ^œ[Daniel Defoe \(1725?\)](#), son of a tallow chandler (a member of the *Worshipful Company of Butchers*) and aspiring member of the gentry. His writings grew in popularity through the 19th century:

How many frequent robberies are committed by these jannappers? And to how many more are they confederates? Silver spoons, spurs, and other small pieces of plate, are every day missing, and very often found upon these sort of gentlemen; yet are they permitted, to the shame of all our good laws, and the scandal of our most excellent government, to lurk about our streets, to debauch our servants and apprentices, and support an infinite number of scandalous, shameless

trulls, yet more wicked than themselves, for not a Jack among them but must have his Gill.

By whom such indecencies are daily acted, even in our open streets, as are very offensive to the eyes and ears of all sober persons, and even abominable in a Christian country.

In any riot, or other disturbance, these sparks are always the foremost; for most among them can turn their hands to picking of pockets, to run away with goods from a fire, or other public confusion, to snatch anything from a woman or child, to strip a house when the door is open, or any other branch of a thief's profession.

In short, it is a nursery for thieves and villains; modest women are every day insulted by them and their strumpets; and such children who run about the streets, or those servants who go on errands, do but too frequently bring home some scraps of their beastly profane wit; insomuch, that the conversation of our lower rank of people runs only upon bawdy and blasphemy, notwithstanding our societies for reformation, and our laws in force against profaneness; for this lazy life gets them many proselytes, their numbers daily increasing from runaway apprentices and footboys, insomuch that it is a very hard matter for a gentleman to get him a servant, or for a tradesman to find an apprentice ¹⁵⁸.

Innumerable other mischiefs accrue, and others will spring up from this race of caterpillars, who must be swept from out our streets, or we shall be overrun with all manner of wickedness.

Who's to blame for their poverty and degrading circumstances? 🐛

They were childish ingrates, who expected something for nothing, who refused to take life seriously and suffered the consequences of their indisciplined laziness. It was time for them to grow up, to accept responsibility for life, not live on unearned handouts.

Bernard Mandeville expressed it well. If one supported people through offering them unearned handouts they would become lazy and dependent on welfare.

Charity, where it is too extensive, seldom fails of promoting Sloth and Idleness, and is good for little in the Commonwealth but to breed Drones and destroy Industry.

(Appendix to 1724 edition of *Fable of the Bees* entitled 'An Essay on Charity and Charity-Schools')

Samuel Smiles (1859), in a popular book of the mid 19th century, entitled '*Self-Help*', provided the reasons why, after one hundred and fifty years of unregulated capitalism, the poor were still poor, all-too-often living and working in sub-human conditions. They were 'the extravagant', who 'wasted their resources'. It was their own fault if they were poor!

...the lesson of self-denial - the sacrificing of a present gratification for a future good - is one of the last that is learnt. Those classes which work the hardest might naturally be expected to value the most money which they earn. Yet the readiness with which so many are accustomed to eat up and drink up their earnings as they go, renders them to a great extent helpless and dependent upon the frugal.

Any class of men that lives from hand to mouth will ever be an inferior class. They will necessarily remain impotent and helpless, hanging on

to the skirts of society, the sport of times and seasons. Having no respect for themselves, they will fail in securing the respect of others. In commercial crises, such men must inevitably "go to the wall." Wanting that husband power which a store of savings, no matter how small, invariably gives them, they will be at every man's mercy, and, if possessed of right feelings, they cannot but regard with fear and trembling the future possible fate of their wives and children.

"The world," once said Mr. Cobden to the working men of Huddersfield, has always been divided into two classes - those who have saved, and those who have spent - the thrifty and the extravagant.

The building of all the houses, the mills, the bridges, and the ships, and the accomplishment of all other great works which have rendered man civilized and happy, has been done by the savers, the thrifty; and those who have wasted their resources have always been their slaves.

It has been the law of nature and of Providence that this should be so; and I were an imposter if I promised any class that they would advance themselves if they were improvident, thoughtless, and idle.

(^œ1859, Chapter 9 Para.5)

^œSamuel Scriven's 1842 report to the House of Commons on factory conditions in 'Mines and Manufactories', outlined the problems in dealing with the poor. No matter what good, virtuous gentlemen did, nothing could be improved so long as the poor behaved as they now did.

To contextualize Scriven's views, one needs to remember the contemporary situation in which he was writing.

The Speenhamland decrees ¹⁵⁹ in the late 18th century allowed employers to pay "market rates" for labor, which soon drove wages below what was necessary to maintain subsistence. Parishes were required to make up the shortfall from their rates. The significance of this is that wages really did fall below what was considered necessary to ensure subsistence. It was not possible to live on the wages of just one or two members of the family without parish support.

In 1834 the Poor Laws were amended to remove this 'burden' from the parishes, transferring it to the poor. After all, what had they to complain about? All they had to do was 'get a job'.

Parents, in 1840, did not send children to work because they were 'proverbially improvident'. They desperately needed every penny they could get. As William Booth could still explain at the end of the century,

... the want of money is the cause of an immensity of evil and trouble. The moment you begin practically to alleviate the miseries of the people, you discover that the eternal want of pence is one of their greatest difficulties.

(^œWilliam Booth (1890))

This, however, is clearly not the view of Samuel Scriven:

The manufacturers are gentlemen who 'evinced a warm-hearted sympathy for those about them in difficulty or distress, contribute as much as possible to their happiness, and are never known to inflict punishments on the children, or to allow others to do so':

The manufacturers are a highly influential, wealthy, and intelligent class of men: they evince a warm-hearted sympathy for those about them in difficulty or distress, contribute as much as possible to their happiness, and are never known to inflict punishments on the children, or to allow others to do so.

It, would be invidious to particularise individuals, but I should do them injustice as a body if I did not acknowledge their liberality in allowing me unrestrained admission to every department of their works, as well as the desire they have shown to render me every assistance and co-operation, with the view of carrying out the objects of the Commission ...

They can hardly be held responsible for the consequences of the lifestyles of their proverbially improvident employees.

The processes being such as to admit of the employment of whole families father, mother, and some two, three, or more children - their united earnings are sometimes 3l. or 4l. per week: but, proverbially improvident, and adopting the adage,- "sufficient unto the day is the evil thereof", they squander the proceeds of their labor in gaudy dress, or at the skittle-ground and ale-house; so that, when overtaken by illness or other casualty, and thrown for a few days out of work, they resort to their masters for a loan, or to the parish workhouse for relief.

Thoughtless and improvident parents, showing no regard for the consequences to their offspring, permit them to continue working in sub-standard conditions. So long as they can reap the advantages of their labor they encourage them to work in conditions like these:

The processes and departments to which I beg leave to direct your especial attention are the dipping, scouring, throwing, plate, saucer, and dish making, and printing, as those in which very young children are found. The effects I have observed in the first and second, on many of the older hands, and the evidence I have recorded from all, have satisfied me that they are the most pernicious and destructive in the whole process of potting.

It is true that in many instances persons have been known to have worked as dippers many years without any material consequences resulting, or being perceptible, and they will tell you "'tis not so bad now as formerly, when a greater proportion of the poisonous metal entered into the composition of the liquid;" but even in them, whose constitutions may have been less susceptible of its influences, I have been able to trace in their dull and cadaverous countenances its insidious workings.

In most of the rooms there are one or two adults, with their attendant boys, whose business it is to bring the ware in its rough, or, in the phraseology of the potter, in its biscuit state, from the warehouse or painting-room to the tub. By constant handling, the fingers become so smooth and delicate that they sometimes bleed, and thereby render the process of absorption more certain and rapid. The dipping itself; performed by the man, is momentary, and, when completed, the article is passed on to the boys for shelving and drying; the liquid consists of borax, soda, potash, with whiting, stone, and carbonate of lead, finely ground and mixed together with water; for coarse goods a large proportion of lead is used, and in some cases arsenic.

The workers seem to have a complete disregard of the dangers around them. They recklessly eat their meals in the most unhygienic of surroundings.

Both men and boys have their hands and cloths almost always saturated with it; and reckless of the danger they incur, seldom or ever change, or use precautionary measures, frequently taking their meals in the same room, sufficiently satisfied to wipe their hands on their aprons. I have never seen rooms provided for cleansing, although it appear in some of the returned schedules that there is plenty of water and at their command.

From their disregard of prophylactic measures; you will not be surprised that paralysis, colica pictonum, epilepsy, and a host of other nervous diseases; are to be met with in all their aggravated forms. The most constant, however, is that of partial paralysis of the extensors of the hands in men, and of epilepsy in children, accompanied at all times with obstinate constipation of the bowels and derangement of the alimentary canal.

But the strongest assurance that can be adduced of the deleterious effect that this process has on children, to be found in the evidence of the men themselves, who, when their affections have been appealed to as fathers of families, have invariably, to the question " Would bring your own son to the dipping-tub ?" replied " No: " and in the instance of John Cooper he continued because I love my child, and would rather that should live."

The average amount of weekly wages for men in this department is 30s., for boys 5s., which is higher than in many others, and obtained as an equivalent for " the risk they run." This pay is a strong temptation to the thoughtless and improvident parent, who, regardless of consequences to their offspring, permit them, so long as they reap the advantages of their labor, to continue in this pest-house.

The parents seem to have no interest in educating their children, sending them at too early a period of life to labor from morning till night.

The masters show the concern one would expect from socially aware gentlemen. They acknowledge and lament the children's low and degraded condition.

The problem really is the total indifference of the parents.

I almost tremble, however, when I contemplate the fearful deficiency of knowledge existing throughout the district, and the consequences likely to result to this increased and increasing population, and would willingly leave the evidence to speak for itself, did I not feel that I should ill discharge my duty were I to shrink from the task; on an examination of the minutes of evidence which I have the honour to forward from Cobridge, Burslem, etc. etc., it will appear that more than three-fourths of the persons therein named can neither read nor write.

An internee may be possibly drawn that I may have been partial in my selection of them, but I beg distinctly to be understood as having on all occasions had them before me irrespective of any educational competency they may have possessed. But it is not from my own knowledge that I proclaim their utter, their absolute ignorance. I would respectfully refer you to the evidence of their own pastors and

masters, and it will appear that as one man they acknowledge and lament their low and degraded condition.

My experience has satisfied me that this state of things is attributable to the three following causes:

30) The first, and perhaps most prominent, I conceive to be that of sending children at too early a period of life to labor from morning till night, in hundreds of cases for 15 or 16 hours consecutively, with the intermission of only a few minutes to eat their humble food of "tatees" and "stir pudding", and where they acquire little else than vice, for the wages of 1s. or 2s. per week, whereby they are necessarily deprived of every opportunity of attending a day or evening school.

31) Another is the total indifference of parents, who, although in numberless instances earning from 2s. to 3s. or 4s. per week, and not requiring the early labor of their offspring, nevertheless care so little about their immediate or future welfare, as to be equally satisfied whether they continue in ignorance or not.

32) A third is doubtless the poverty of others unemployed.

The workers appear to have no self-respect. They live in disgusting, squalid conditions,

The position of the town being elevated, and upon the brow of a hill, it is consequently exposed to the winds from all quarters, but more especially to the north-east, for a valley approaches the town in this direction, and serves to give force and increased effect to the cold winds which prevail from that quarter.

It is to this elevated position and free ventilation that I am disposed to attribute our comparative exemption from epidemic and certain endemic diseases, especially to the common fever of the country, which in the summer and autumn more particularly prevails in the surrounding towns of Burslem, Newcastle, and Stoke; whilst Hanley and Shelton suffer much less from the disease. But owing to this position and particular exposure to the most ungenial wind of the heavens, the north-east, I conceive a peculiar character is, to a certain extent, given to the diseases of the town-pulmonary affections prevailing very extensively.

The direction in which the streets are built might have slightly counteracted this unfavorable exposure, but unfortunately the inhabitants have, no doubt in ignorance and without design, given it increased effect by arranging most of the streets on the north-east and eastern side of the town in a direction parallel to the current of the wind when it blows from this quarter.

There is a small closely-built district near the centre of Hanley, called Chapel Field, and a series of blind streets branching off from the main street in Shelton, both which places are crowded with inhabitants living in squalid poverty. Many of the inhabitants of these spots, but especially the children, have a peculiarly sickly aspect, most probably from the poor and improper food they take, conjoined with the impure air they breathe. Numbers of children die during infancy in these quarters of the town, and fevers and other epidemic diseases prevail there most extensively and in their most virulent forms.

In different parts of the town and on its outskirts there are many stagnant pools in which vegetable matter is constantly undergoing a

process of putrefaction, for they are used for the purpose of steeping hazel-rods in, to render them more pliant in the use to which they are applied, that of forming crates, in which the earthenware of the neighbourhood is packed.

They are very well paid in comparison with workers in other manufacturing districts but their improvidence is their undoing!

The wages paid in this neighbourhood are good, better than those of most other manufacturing districts. Habits of improvidence prevail notwithstanding extensively; and it not unfrequently happens that men who draw 3s. a-week for their own work and that of their children, suffer some of the evils and many of the irregularities of poverty.

Intemperance in intoxicating drinks is a serious evil among the working class. Many of them allowing their families almost to starve to beg in order that they may indulge in this vice. The numbers of public-houses, beer, and spirit shops being great, and the latter appearing to enjoy a very prosperous trade ...

The women do not acquire those domestic habits which would best fit them for housewives and mothers. They continue to work while they are pregnant and then send out their infants to nurse during the day.

The females, from being employed from an early age in the manufactories as transferrers painters, burnishers, etc., do not acquire those domestic habits which would best fit them for housewives and mothers: and it frequently happens that when they are bearing children they continue to labor in the manufactories, and send out their infants to nurse during the day, This is a source of great mortality amongst infants, for they are fed by their nurses chiefly with bread steeped in water, and they early become sickly, and die of various diseases of the digestive organs, those of the chest, or head ...

One could continue with this report, but it is simply more of the same: atrocious conditions, and improvident, irresponsible inhabitants who seem to disregard both their own and their children's wellbeing.

The Report concludes with a set of appendices in which both responsible people of the towns and employees in the various factories are given a voice. The conclusions to the first and last of these is given below.

Scriven Report: Doctors report on health conditions: Appendix No. 1. A few REMARKS on the GENERAL and sanatory condition of the town of HANLEY and SHELTON, and its Inhabitants, more especially with respect to the Health of the Children of the Working Classes:

...In conclusion I may add, as the result of my observation from a residence of 17 years in this town, during which time I have practised as a surgeon, that children are sometimes cruelly overworked, in the process of plate-making especially, and that in other labors, and in the collieries, they are exposed to very unhealthy occupations. They also suffer greatly from the improvident and intemperate habits of their parents. In such cases their clothing is defective, and especially towards the end of each week their food very scanty. Their education is exceedingly imperfect, and the religious instruction they receive ought to be much more contemplate in the department of morals.

(Signed) J. B. DAVIS, Surgeon

Perhaps we should allow the Reverend Aitken to have the final comment.
Scriven Report: Teachers & Clergy reports: Appendix No. 119. LETTER from

the Rev. R. E. Aitkens, incumbent of Hanley:

Sir;

To the inquiries which you have been pleased to submit to me respecting the moral condition of the children employed in the manufactories in this place, I cannot give any additional evidence to that which you have received from the worthy master of the National School, which you read in my presence before him, and which with some slight alterations, in which he concurred, I confirmed viva voce. I am not sure whether it was expressed in your notes that the school is under the superintendence of the incumbent of Hanley.

Respecting the two subjects of inquiry (at the bottom of p.10 and the top of p.11) to which, by your marginal mark, you have directed my especial attention, I beg to offer the following observations, which are the result of considerable experience.

I have almost invariably found that the habits invariably acquired by women, rendering them more or less fit to perform their duties as wives and mothers, depend infinitely less on the occupations by which they procure their maintenance, than in their domestic training by the instructions and examples of their mothers. Let the mother be industrious, notable, decorous, and devout, and generally you will find her daughters of the same character, whether they continue to reside at home and earn their livelihood by the use of the needle, or whether they are employed in the manufactories. I have uniformly found the case in this rank of life similar to the oft-debated and endless question of the respective advantages of public or private schools among the higher and middle classes of society. In both cases the eventual moral habits of individuals will depend more on the dispositions which they bring from home than what they acquire in the school or manufactory.

 (15/01/16)

No reference is made to the consequences of changes in the Poor Laws. [Wages are assumed to be more than adequate](#) for the legitimate needs of the inhabitants. And adverse conditions are largely of their own making.

These were the conditions of 'the poor' in Britain after one hundred and fifty years of politically dominant capitalist development.

We need to ask how conditions like these emerged.

What shall we do with The Poor? 🐦

In the 18th and 19th centuries, 'the poor' were to find that it was time for them to be re-educated. They were to become the 'mission field' for morally upright, responsible Western Europeans. And for the good of both 'decent society' and their immortal souls, they were to be taught discipline and obedience, they were to be taught to work. It would be a long, drawn-out and painful process, and those being re-educated would endure much misery and heartache, but they were going to be taught.

Although it might seem a cruel policy, the only reasonable way of dealing with those who needed help was to compel them to work. There were times in life when one had to be cruel to be kind. As James argued,

the social legislators of the Restoration aimed at nothing less than making the poor a source of profit to the state by forcing them to work for reduced wages.

(in Wilson 1969, p. 119)

But they did not do so vindictively. This was not a 'class war', it was a class-focused re-education program. As Wilson says,

what came to be regarded by later critics as a system of calculated brutality and repression arose in the first place not from unconcern or harshness, but out of a desire to protect the efforts of those local authorities who were trying hardest to improvise remedies.

(1969, p. 134)

The Poor are lazy with no desire to Better Themselves! 🐦

A major problem encountered in dealing with 'the poor' was that they seemed to have little desire either to accumulate possessions or to save for the future ¹⁶⁰. And, perhaps more importantly for those who now held the reins of power in Britain, and, increasingly, in the rest of western Europe, the poor did not seem to understand or appreciate the vital importance of work, for its own sake, that is, for its character building potential ¹⁶¹. This was not merely a concern of the 18th century. It had become an increasingly important concern of 'responsible' people over the previous two hundred years.

œEdmond Fitzmaurice explained that Sir William Petty, writing in 1665, recognized how intractable the problem was of getting 'The Poor' to work consistently. They seemed content "to live in a condition little above that of animals".

His own observations of the habits of the cloth-workers in England and of the Irish peasantry compelled him, however reluctantly, to the opinion that the general standard of living was as yet too low to make high daily wages of any advantage to the laborer, because of their tendency at once to reduce their hours and be content with wages just sufficient to support existence at a very low level of material civilization.

"It was observed," he says,

by clothiers and others who employ great numbers of poor people, that when corn is extremely plentiful that the labor of the poor is proportionately dear and scarce to be had at all, so licentious are they who labor only to eat, or rather to drink.

It was the same in Ireland, especially since the introduction of that breadlike root, the potato. A day of two hours labor was there sufficient to make men to live after their present fashion, and the cheapness of food was the excuse for the people to live in a condition little above that of animals.

(1895, p. 220)

Sir Josiah Child, in 1668, put his finger on the problem,

And for our own Poor in England, it is observed, that they live better in the dearest Countries for Provisions, than in the cheapest, and better in a dear year than in a cheap, (especially in relation to the Publique Good) for that in a cheap year they will not work above two days in a week; their humor being such, that they will not provide for a hard time; but just work so much and no more, as may maintain them in that mean condition to which they have been accustomed.

(Josiah Child, ^œ[Brief Observations Concerning Trade and Interest of Money](#), London, Printed for Elizabeth Calvert at the Black-spread Eagle in Barbican, and Henry Mortlock at the Sign of the White-Heart in Westminster Hall. 1668)

The poor seemed focused on the present, unaware of the future, living from hand to mouth.

Sir Henry Pollexfen pronounced in 1697 that

the advances of wages hath proved an inducement to idleness; for many are for being idle the oftener because they can get so much in a little time;

and Bernard Mandeville in 1714 asserted that

Every Body knows that there is a vast number of Journey-men ... who, if by Four Days labor in a Week they can maintain themselves, will hardly be persuaded to work the fifth; and that there are Thousands of Laboring Men of all sorts, who will ... put themselves to fifty Inconveniences ... to make Holiday.

(Hatcher 1998, p. 68)

Ferguson identified the problem as one of being 'uncivilized'. In straying from speaking of the poor to speaking of the barbarian, Ferguson, in common with most other writers of the 18th century, betrayed his view of the poor in his own country. It was as though they belonged to another society, alien and devoid of the moral virtues of the civilized; impetuous, artful, rapacious, violent, deceitful and slothful,

Actuated by great passions, the love of glory, and the desire of victory, roused by the menaces of an enemy, or stung with revenge; in suspense between the prospects of ruin or conquest, the barbarian spends every moment of relaxation in the indulgence of sloth.

He cannot descend to the pursuits of industry or mechanical labor: the beast of prey is a sluggard; the hunter and the warrior sleeps, while women or slaves are made to toil for his bread.

But shew him a quarry at a distance, he is bold, impetuous, artful, and rapacious: no bar can withstand his violence, and no fatigue can allay his activity.

(^œ[1767 Part 2, Section 3](#))

As Foucault (1971) claimed, for 'responsible' western Europeans of the 17th and 18th centuries, sloth had become the worst of all sins, and productive labor the best of all disciplines and virtues, having its own, inevitable rewards.

'The poor', like the barbarians, appeared unable to understand why this should be so. Consequently, they labored for only so long as was necessary to supply their meager wants and needs and then focused on other activities, more often than not, various forms of 'time wasting' such as socializing and 'loitering'.

For 18th and 19th century reformers, 'loitering' was a pernicious pastime of those who were 'slothful', those who seemed content with their miserable lot and who clearly lacked all motivation to 'better themselves' ¹⁶². ^œJohn Marshall (1698), in a commentary on John Bunyan's writings, put it well,

Bunyan well knew that idleness engenders poverty and crime, and is the parent of every evil; and he exhorts his runner to the greatest diligence, not to 'fool away his soul' in slothfulness, which induces carelessness, until the sinner is remediless ...¹⁶³

Born Again or Not - They need to Learn Discipline! 🐦

The nature of the activity in which 18th century responsible people were to engage in getting the poor to commit to consistent work was strongly influenced by their religious predisposition. For those less religiously inclined, the poor could be disciplined to work through legal compulsions; for those who saw religious commitment as central, no amount of discipline, no depth of punishment could bring about the needed transformation until the heart and soul of the individual had been *reborn* ¹⁶⁴.

For the great majority of middle ranking people, the answer lay in laws and regulations, in disciplining and directing the activity of those who threatened the prosperity of the age. But, for a significant minority, those who still strongly identified with the religious longings and ambitions of the 17th century, the problems of the age could not be overcome simply through compulsion and legislation. Before people could even contemplate such transforming changes in their lifestyles they needed to be empowered by God. People needed to be 'born again', starting out on a new life empowered by God to become sanctified in mind and body.

They would still have to yield to discipline, and they would still have to show that perseverance and industry which marked the truly moral person, but the transformation could not begin until they had been made into new people, saved to serve God in the way He chose (and Responsible Western Europeans knew) they should. Having yielded their lives to God, they should focus on the life before them, determined to "work out their salvation with fear and trembling".

^œJohn Wesley, in 1762, adjured his followers,

Be always employed; lose no shred of time; gather up the fragments, that nothing be lost. And whatsoever thy hand findeth to do, do it with thy might.

Only God could perform the miraculous transformation which was needed in the lives of those who were trapped in sloth and its consequences. Unless there was true repentance, born of clear understanding of the depths of depravity in which they were sunk, there could be no redemption.

The redeemed, in gratitude to God, would apply themselves unstintingly to virtuous, productive lives. As Charles Wesley, in a popular hymn of the period, wrote,

Depth of mercy, can there be, mercy still reserved for me? Can my God his wrath forbear, me the chief of sinners spare?

Isaac Watts put it equally eloquently,

Amazing grace, how sweet the sound that saved a wretch like me! I once was lost, but now I'm found, was blind, but now I see!

Once that transformation had been made, it was the responsibility of the redeemed to make the most of the new lives they had received at God's hand.

Over the next two hundred years these alternative focuses were to produce very different determinations in those who held them.

Those who saw the future as one of discipline and punishment *knew* that attempting to relieve the sufferings of the poor would be counter-productive.

œHerbert Spencer (1884), in the late 19th century, was still wrestling with how best to ensure that 'The Poor' acquired 'the capacities needful for civilized life'. This had exercised the minds of 17th and 18th century writers like Petty, Child, Pollexfen, Marshall, Mandeville, Defoe, Ferguson and Townsend. Yet, at the end of the 19th century, it had still not been resolved.

Spencer explained what he believed was required to make the lower classes 'fit for the social state'. Those who felt sorry for the poor, who wanted to rescue them from the harshness of their lives, were working against the tide of human evolution. All the evils of the age; the poverty, degradation, maltreatment of the lower classes 'are unavoidable attendants on the adaptation now in progress':

To become fit for the social state, man has not only to lose his savageness, but he has to acquire the capacities needful for civilized life. Power of application must be developed; such modification of the intellect as shall qualify it for its new tasks must take place; and, above all, there must be gained the ability to sacrifice a small mediate gratification for a future great one.

The state of transition will of course be an unhappy state. Misery inevitably results from incongruity between constitutions and conditions. All these evils which afflict us, and seem to the uninitiated the obvious consequences of this or that removable cause, are unavoidable attendants on the adaptation now in progress.

Humanity is being pressed against the inexorable necessities of its new position - is being molded into harmony with them, and has to bear the resulting unhappiness as best it can. The process must be undergone, and the sufferings must be endured.

No power on earth, no cunningly-devised laws of statesmen, no world-rectifying schemes of the humane, no communist panaceas, no reforms that men ever did broach or ever will broach, can diminish them one jot.

Intensified they may be, and are; and in preventing their intensification, the philanthropic will find ample scope for exertion. But there is bound up with the changes a normal amount of suffering,

which cannot be lessened without altering the very laws of life.
(1884 Ch. 3, p. 40)

For Spencer, as for the vast majority of 'responsible' Western Europeans of the 18th, 19th, and 20th centuries, human beings were on a millenarian evolutionary journey. There was [a direction to social change](#) and that direction, provided people took their responsibilities seriously, was upwards, into a future of growing material prosperity and well-being.

The utopian presumptions of the previous two centuries ¹⁶⁵ had become a part of the background of understanding for the 'middle sorts' of western Europe. And, with the absorption of these presumptions into the unconscious substrate of reasoning, the implied dangers of not pressing toward that goal of the 'upward call of God' became similarly internalized, no longer a matter of belief but one of certainty, no longer religiously justified, but now materially certified.

The progress of humanity was written into the material constitution of human beings, just as the changes in the earth's surface and in the heavens were increasingly being seen as consequences of inescapable and unstoppable 'forces of nature'.

The attitudes of western European employers in the 18th and 19th centuries toward the poor were hundreds of years in the making. By the 15th century, employers and landowners were already convinced that 'the poor' would only work consistently if compelled to do so. Their experiences following the Black Death of the mid 14th century ¹⁶⁶, when labor became very scarce while the tasks to be done remained about the same as they had been when there was a much larger workforce, convinced them that they could not rely on the goodwill of those they employed.

Of course, if one sees the situation from the laborers' point of view, the demands made of them from the early 1350s onwards were entirely unreasonable. The presumption that those who remained would meet all the laboring demands previously met by as much as double their number five years earlier, resulted in them being required to work for very long hours, for very little more reward.

Since they were geared to labor as a means of meeting needs and wants rather than as a means to the open ended accumulation of money and possessions, once they obtained the cash they needed it seemed pointless to continue working. There were better things to do than work when the product was no longer needed.

How deep-seated such understandings and motivations in life are, and how difficult it is to retrain people to new perspectives. 'Responsible' western Europeans had been passing laws and organizing processes of retraining for 'the poor' for more than three hundred years before the concerted efforts of the 18th and 19th centuries.

The 'responsible public' of the 18th century was, undoubtedly, largely comprised of self-serving, self-interested, self-promoting individuals who wanted the world organized to their benefit. They were, however, nonetheless, convinced of the historical necessity underpinning the reforms they supported.

The world, for them, was becoming, more and more certainly, a world of resources and a world of productive, wealth-generating activity. They were the vanguard of the future, creating a world which would benefit all. But, to effectively pursue these goals, the laziness, indiscipline and profanity of the

'lower rank' had to be addressed. ^œ[Daniel Defoe](#), of *Robinson Crusoe* fame, described the problem in the 1720s,

... the conversation of our lower rank of people runs only upon bawdy and blasphemy, notwithstanding our societies for reformation, and our laws in force against profaneness; for this lazy life gets them many proselytes, their numbers daily increasing from runaway apprentices and footboys, insomuch that it is a very hard matter for a gentleman to get him a servant, or for a tradesman to find an apprentice.

In the 18th century, following a relative lull in activities during the later 17th century, the enclosure of common land, dispossession of peasant landholders and consolidation of landholdings took on new momentum. As it did so, the ranks of dispossessed and indigent people were swelled by those moved from the land. The common view of 18th century reformers was that almost half of the land available for farming in Britain was 'waste', that is, not used 'profitably'. They set out to make it economically productive and efficient.

They'll work if they're hungry! 🐔

★ The poor know little of the motives which stimulate the higher ranks to action - pride, honour, and ambition. In general it is only hunger which can spur and goad them on to labor; yet our laws have said, they shall never hunger. The laws, it must be confessed, have likewise said that they shall be compelled to work.

But then legal constraint is attended with too much trouble, violence, and noise; creates ill will, and never can be productive of good and acceptable service: whereas hunger is not only a peaceable, silent, unremitted pressure, but, as the most natural motive to industry and labor, it calls forth the most powerful exertions; and, when satisfied by the free bounty of another, lays a lasting and sure foundation for good will and gratitude ...

The wisest legislator will never be able to devise a more equitable, a more effectual, or in any respect a more suitable punishment, than hunger is for a disobedient servant. Hunger will tame the fiercest animals, it will teach decency and civility, obedience and subjection, to the most brutish, the most obstinate, and the most perverse.

(^œ[Joseph Townsend 1786](#))

Sir Josiah Child had identified the problem in the 17th century, the poor "work so much and no more, as may maintain them in that mean condition to which they have been accustomed". It was time to make sure that they received no more than would keep them working. And it was time to take away any supports the poor might be relying on other than wage labor.

The 'responsible' people of the mid 18th century found a way to do this which would both force the poor into a consistent commitment to work and ensure the rational reorganization of the countryside. They accelerated the alienation of common lands and the dispossession of small holders:

The enclosure of commons had been going on for centuries before 1760, but with nothing like the rapidity with which it has been going on since, it is known that 554,974 acres were enclosed between 1710 and 1760, while nearly 7,000,000 were enclosed between 1760 and 1845.
(^œ[Arnold Toynbee \(1884\)](#))

The dispossession of small holders gathered momentum as the 18th century unfolded. Toynbee (1884) summarized the movement,

A third result of landlord supremacy was the manner in which the common-field system was broken up. Allusion has already been made to enclosures, and enclosures meant a break-up of the old system of agriculture and a redistribution of the land. This is a problem which involves delicate questions of justice.

In Prussia, the change was effected by impartial legislation; in England, the work was done by the strong at the expense of the weak. The change from common to individual ownership, which was economically advantageous, was carried out in an iniquitous manner, and thereby became socially harmful.

Great injury was thus done to the poor and ignorant freeholders who lost their rights in the common lands.

In Pickering, in one instance, the lessee of the tithes applied for an enclosure of the waste. The small freeholders did their best to oppose him, but, having little money to carry on the suit, they were overruled, and the lessee, who had bought the support of the landless 'house-owners' of the parish, took the land from the freeholders and shared the spoil with the cottagers.

It was always easy for the steward to harass the small owners till he forced them to sell... The enclosure of waste land, too, did great damage to the small freeholders, who, without the right of grazing, naturally found it so much the more difficult to pay their way.

Those who lost access to lands joined the ranks of 'the poor', forced to live on the charity of parishes or move to the outskirts of towns in an attempt to find some alternative means of subsistence. As they did so, the 'problem of the poor' became increasingly obvious to responsible citizens ¹⁶⁷.

The problems attending the enclosure of common lands were just the tip of the iceberg. At the same time as people who relied on common lands found themselves denied access, small holders who held sufficient land to make ends meet found that their lands, in the eyes of those who held political power, were 'waste land' that could be 'more productively' used. They found the political conditions of the time stacked against them.

Large landowners had gained the whip hand and set out to dispossess the yeomen of England of the lands they held:

To summarise the movement: it is probable that the yeomen would in any case have partly disappeared, owing to the inevitable working of economic causes. But these alone would not have led to their disappearance on so large a scale. It was the political conditions of the age, the overwhelming importance of land, which made it impossible for the yeoman to keep his grip upon the soil.

Toynbee (1884)

People who, until the mid 18th century, had felt themselves relatively safe from the dispossession experienced by rural laborers and others who relied heavily on access to the commons for survival, now found themselves the target of land reform.

Their problems were not only brought on by rapacious landlords and changes in statutes which were strongly weighted against them. They were compounded by the movement of industry through the 18th century from

the countryside into towns. Traditionally, small holders had augmented their income by spinning, weaving and other forms of handicraft. As these activities became the focus of factory development, the returns for their labors were greatly reduced. Very often the market for their produce simply disappeared.

Many who were not evicted or defrauded of their properties, found that they could no longer make a living from the land they held, and were either compelled by circumstance into sending more and more members of their households into towns in search of work, or found themselves [having to accept the very low prices being offered for rural land](#) and move to the rapidly growing towns and cities of western Europe (but particularly of England). And, as is always true under capitalism, the increased labor which became available to employers resulted in constant reductions in wages.

[We'll Compel Them through Laws and Regulations!](#) 🐘

For the Middle Ranks, of course, the problems were not those of dispossession and abuse, they were problems of sloth and intemperance, which inevitably resulted in crime and violence. The poor were fundamentally lazy and unwilling to put the needs of the country above their own petty concerns and interests. They would, if they could, undermine all that was being achieved in ensuring the 'wealth of the nation'.

The indolent poor must be compelled to contribute to the prosperity of the country, and the government must act strongly and decisively to deal with what was rapidly becoming not 'the poor' but 'the criminal' class. John Simon described the scene,

Sir Samuel Romilly [1786] in his *Observations on a Late Publication, intituled Thoughts on Executive Justice*, reviews the criminal law of England, and says -

The first thing which strikes one is the melancholy truth that among the variety of actions which men are daily liable to commit, no less than one hundred and sixty have been declared by Act of Parliament to be felonies without benefit of clergy; or, in other words, to be worthy of instant death. [¹⁶⁸]

Romilly founds his statement on Blackstone's Commentaries; and, in a note, he draws attention to the fact that, since the publication of those Commentaries, the number of felonies had been considerably augmented by the legislature. Sydney says

To steal a horse or a sheep; to snatch property from the hands of a man and run away with it; to steal to the amount of forty shillings in a dwelling-house, or privately to the value of five shillings in a shop; to pick a pocket of only twelve pence and a farthing; these offences all continued till the end of the eighteenth century to be punishable with death.

England and the English, vol. ii. pp. 268, 269.

Mr. John Latimer, in *The Annals of Bristol in the Eighteenth Century*, gives a list of the persons executed in that city during the first half of the eighteenth century. The list is confessedly incomplete, but, so far as we can judge by its details, executions for murder were comparatively infrequent. Out of the seventy-seven criminals whose cases and crimes are cited, only eighteen suffered death for murder. The rest were executed for offences, which would now be punished by imprisonment.

It is no wonder that the number of executions in England was great. Lecky tells us that, when Blackstone wrote, it was a very ordinary occurrence for ten or twelve culprits to be hung on a single occasion, and for forty or fifty to be condemned at a single assize. In 1732 no less than seventy persons received sentence of death at the Old Bailey. In the same year eighteen persons were hung in one day in the town of Cork.

History of England, vol. i. p. 505.

... It is painful to record these brutalities, but it is impossible to understand the temper of the English people in the eighteenth century unless we do so. An utter callousness to the sufferings of criminals prevailed. We may go further. Those sufferings were a source of pleasurable excitement to the crowds that witnessed them. When the death-carts rumbled along the road from Newgate to Tyburn, the pavements were crowded with spectators. From the windows of the houses, hosts of people looked out with admiration upon the jaunty men who, with nosegays on their breasts, journeyed on the solemn path that broke away so suddenly into eternity.

Let the wanderer along the present Oxford Street imagine the scene. Let him try to conceive the possibility of its repetition to day. He will then be able to form some idea of the immeasurable distance that divides us from the spirit and the customs of the eighteenth century.

We ask in amazement if any voice was raised in Church or State, against the brutal punishments contained in the criminal code of England. The answer is disappointing. The ascertained facts show that, so far as the executions for felony are concerned, not only was there an absence of protest, but such executions were approved by the most enlightened opinion of the time.

(^œ[1908 p. 63](#))

Boswell recorded a discussion between Samuel Johnson and Sir William Scott in 1783, when told that criminals to be hanged were no longer to be publicly paraded on the way to execution,

... He said to Sir William Scott, 'The age is running mad after innovation; all the business of the world is to be done in a new way; men are to be hanged in a new way; Tyburn itself is not safe from the fury of innovation.'

It having been argued that this was an improvement, '-No, Sir, (said he, eagerly,) it is NOT an improvement: they object that the old method drew together a number of spectators. Sir, executions are intended to draw spectators. If they do not draw spectators they don't answer their purpose. The old method was most satisfactory to all parties; the publick was gratified by a procession; the criminal was supported by it. Why is all this to be swept away?'

I perfectly agree with Dr. Johnson upon this head, and am persuaded that executions now, the solemn procession being discontinued, have not nearly the effect which they formerly had.

(^œ[Boswell 1791](#))

Punishments were not to be viewed as acts of vengeance, but as cautionary devices, discouraging others from similar behavior (reminiscent, of course, of ^œ[Thomas More's 1516 description](#):

...the severe execution of justice upon thieves, who ... were then hanged so fast that there were sometimes twenty on one gibbet

- there has been a long history of blaming and punishing victims in western Europe).

Throughout the century, the vastness of the problem, and the difficulties of dealing with it, occupied the minds of socially aware, responsible people. Those most directly involved in addressing the problem felt a sense of hopeless frustration at the immensity of the task which confronted them. It was not that a *few* of the 'lower rank' were lazy and degenerate, this seemed to be the condition of everyone.

E. P Thompson described the attitude of Josiah Tuck, dean of Gloucester, in 1745,

'the *lower* class of people' were utterly degenerated. Foreigners (he sermonized) found 'the *common people* of our *populous cities* to be the most *abandoned*, and *licentious* wretches on earth': 'Such brutality and insolence, such debauchery and extravagance, such idleness, irreligion, cursing and swearing, and contempt of all rule and authority... Our people are *drunk with the cup of liberty*.'
(1967, pp. 80-81)

Daniel Defoe in the 1720s seems to have put the common view of 'responsible members of the public' into words in a pamphlet entitled, *Everybody's Business Is Nobody's Business Or, Private Abuses, Public Grievances: Exemplified In the Pride, Insolence, and exorbitant Wages of our Women, Servants, Footmen, etc.*, which rapidly ran to five editions.

As he says in the preface to the fifth edition, his intentions, in writing the pamphlet have,

had the good fortune to meet with approbation from the sober and substantial part of mankind; as for the vicious and vagabond, their ill-will is my ambition.

His language is blunt and his views uncompromising,

It is with uncommon satisfaction I see the magistracy begin to put the laws against vagabonds in force with the utmost vigour, a great many of those vermin ... having lately been taken up and sent to the several work-houses in and about this city; and indeed high time, for they grow every day more and more pernicious...

I, therefore, humbly propose that these vagabonds be put immediately under the command of such taskmasters as the government shall appoint, and that they be employed, punished, or rewarded, according to their capacities and demerits; that is to say, the industrious and docile to woolcombing, and other parts of the woollen manufacture, where hands are wanted, as also to husbandry and other parts of agriculture.

His solution to the problem of the unreliability of day workers and servants was to pass innumerable laws and regulations governing their behavior with which they

must either comply or be termed an idle vagrant, and sent to a place where they shall be forced to work. By this means industry will be encouraged, idleness punished, and we shall be famed, as well as happy for our tranquillity and decorum.

Not only were the poor idle, irreligious and wanton, those who were employed could simply not be trusted. Defoe's pamphlet provides one

example after another of the duplicity, deceit and light-fingeredness of servants and other employees. They displayed

saucy and insolent behavior, ...pert, and sometimes abusive answers, [and] daring defiance of correction.

If they were not watched constantly, they would cheat their employers of all their belongings.

E. P. Thompson described the lengths to which Crowley, owner of the Crowley Iron Works, went in attempting to get his employees to work and in trying to protect himself from their blatant dishonesty. In preambles to two of the 'Orders' of the extensive 'Law Book' of the Company, Crowley wrote,

I having by sundry people working by the day with the connivance of the clerks been horribly cheated and paid for much more time than in good conscience I ought and such hath been the baseness and treachery of sundry clerks that they have concealed the sloath and negligence of those paid by the day...

To the end that sloath and villany should be detected and the just and diligent rewarded, I have thought meet to create an account of time by a monitor, and do order and it is hereby ordered and declared from 5 to 8 and from 7 to 10 is fifteen hours, out of which take 1½ for breakfast, dinner, etc. There will then be thirteen hours and a half neat service...

[This service must be calculated] after all deductions for being at taverns, alehouses, coffee houses, breakfast, dinner, playing, sleeping, smoaking, singing, reading of news history, quarelling, contention, disputes or anything foreign to my business, any way loytering.
(1967, pp. 81-2)

The stress on the 'period of work', and of ensuring that employees worked their full number of hours, was, of course, not new to the 18th century. It was a growing concern of merchants and landowners through the late 14th and 15th centuries, and it grew in importance in succeeding centuries ¹⁶⁹. By the 18th century, Crowley felt it unnecessary to justify this stress.

Everyone who mattered *knew* that people labored for a set period of time each day, and that they *ought* to spend all of that time 'on the job'. Work was not simply 'labor', it was spending *a set time* in a 'place of employment' where the time was 'owned' by the employer.

Not only 'the poor' were organized to 'work time' and 'leisure' or 'non-work' time, so were the industrious middle sorts. Only the gentry, who spent their time in 'public' activities, were not organized in this way. But they too had their sphere of service and should, also, allot a period in each day to the performance of their 'duties'.

While one could rely on responsible members of the community taking their work commitments seriously, this simply could not be assumed of 'the poor'. They would cheat and steal and rob employers of the time they wanted to be paid for. Only constant vigilance, thorough regulation and supervision could ensure that they spent their time in work rather than in taverns, alehouses, and coffee houses, 'loitering' rather than working.

The poor were, as they had been seen for centuries, unreliable, untrustworthy, dishonest, lazy and duplicitous. Responsible people in the 18th century realized that if they continued in this 'savage' state they

threatened all the advances of civilization which seemed promised in the century.

Something had to be done to address what, to the responsible citizens of Britain and the rest of western Europe, was both a disgrace and a dire threat to the well-being of every responsible person. This mass of unredeemed, degenerate humanity had to be redeemed, retrained, made responsible.

Let's Train their Young 🐦

In the 18th century, as in earlier centuries, the means to ensuring conscientious commitment to work by employees were all based on external regulations and legal compulsions. If enough pressure was applied, and people were organized and supervised thoroughly, their work commitment would improve. Government provided the background legislation compelling the poor to work, and individual industrial enterprises provided additional structures and regulations ensuring that laborers really did labor.

 (16/01/16)

But, despite all these measures, the problem of getting the poor to take their laboring responsibilities seriously seemed worse than ever. It was clear that the problem could not be addressed simply by trying to coerce and police adults. It was very difficult to change the habits of a lifetime.

Aphorisms were at hand to justify one of the approaches to retraining the poor: You can't teach an old dog new tricks; you've got to break a horse when it's young. If laws and regulations alone did not work, perhaps overt training of the young would do it.

Edgar Furniss described a range of opinions on the matter expressed during the 18th century,

Very significant of the point of view of these writers are the projects which they advanced for shaping and moulding the characters and destinies of the children of the laboring classes.

Many of these projects strike the modern reader as almost fantastic distortions of justice, but it is necessary that we bear in mind, in attempting to gain an insight into the attitude of their authors, that the proposals were advanced for the good of the nation, and not for the immediate benefit of the children who were to supply the material for experimentation.

William Temple, always an extremist in his point of view, devised one of these:

When these children are four years old, they shall be sent to the country workhouse and there taught to read two hours a day and be kept fully employed the rest of their time in any of the manufactures of the house which best suits their age, strength and capacity.

If it be objected that at these early years, they cannot be made useful, I reply that at four years of age there are sturdy employments in which children can earn their living; but besides, there is considerable use in their being, somehow or other, constantly employed at least twelve hours in a day, whether they earn their living or not; for by these means, we hope that the rising generation will be so habituated to constant employment that it

would at length prove agreeable and entertaining to them ...
(William Temple, *Essay* (1770))

(^œ1920, p.114 ¹⁷⁰)

Children had to be taught, as John Locke (1692) had explained in the late 17th century, to defer gratification of immediate, imprudent desires and lusts in favor of working towards long-term, prudent rewards for diligent endeavor. This would benefit not only the individuals themselves, but also their dependents and communities.

They had to learn the immorality, the sinfulness of sloth and the virtue, the sanctifying power of industry. The evangelist of the age, John Wesley, put it very clearly,

Know ye not then so much as this, you that are called moral men, that all idleness is immorality; that there is no grosser dishonesty than sloth; that every voluntary blockhead is a knave? He defrauds his benefactors, his parents, and the world; and robs both God and his own soul.

Yet how many of these are among us! How many lazy drones, as if only fruges consumere nati! "born to eat up the produce of the soil." How many whose ignorance is not owing to incapacity, but to mere laziness!

(^œ1741 sermon)

It was becoming clear to 18th century responsible people that the horse must be broken when young, or not at all. As Sir John Eardley Wilmot, Chief Justice of the Common Pleas explained in 1777,

Obedience is one of the capital benefits arising from a public education, for though I am very desirous of having young minds impregnated with classical knowledge, from the pleasure I have derived from it, as well as the utility of it in all stations of life, yet it is but a secondary benefit in my estimation of education; for to break the natural ferocity of human nature, to subdue the passions and to impress the principles of religion and morality, and give habits of obedience and subordination to paternal as well as political authority, is the first object to be attended to by all schoolmasters who know their duty and do it.

(^œ*The Gentleman's Magazine* (1811) Volume 109 p. 449 ¹⁷¹)

Through the second half of the 18th century, and on into the 19th, both focuses were to be developed. On the one hand, laws and regulations compelling people to work would be strengthened and applied more and more vigorously, and alternative means of material support would be removed wherever possible. On the other, increasing emphasis would be placed on training the young.

This was not, of course, *education*, as given to the children of the middle ranks. That might well back-fire, giving the children of the poor ideas which were beyond their station. Among those who had not been directly involved in or affected by the religious revivals of the period, the view of education for the masses which Bernard Mandeville expressed in 1724 seems to have been standard,

From what has been said it is manifest, that in a free Nation where Slaves are not allow'd of, the surest Wealth consists in a Multitude of laborious Poor; for besides that they are the never-failing Nursery of Fleets and Armies, without them there could be no Enjoyment, and no Product of any Country could be valuable.

To make the Society happy and People easy under the meanest Circumstances, it is requisite that great Numbers of them should be Ignorant as well as Poor. Knowledge both enlarges and multiplies our Desires, and the fewer things a Man wishes for, the more easily his Necessities may be supplied.

The Welfare and Felicity therefore of every State and Kingdom, require that the Knowledge of the Working Poor should be confined within the Verge of their Occupations, and never extended (as to things visible) beyond what relates to their Calling. The more a Shepherd, a Plowman or any other Peasant knows of the World, and the things that are Foreign to his Labor or Employment, the less fit he'll be to go through the Fatigues and Hardships of it with Chearfulness and Content.

Reading, Writing and Arithmetick, are very necessary to those, whose Business require such Qualifications, but where People's livelihood has no dependence on these Arts, they are very pernicious to the Poor, who are forced to get their Daily Bread by their Daily Labor...

Going to School in comparison to Working is Idleness, and the longer Boys continue in this easy sort of Life, the more unfit they'll be when grown up for downright Labor, both as to Strength and Inclination. Men who are to remain and end their Days in a Laborious, Tiresome and Painful Station of Life, the sooner they are put upon it at first, the more patiently they'll submit to it for ever after.

(*Fable of the Bees* (1724) Appendix: ^œ[An Essay On Charity, and Charity Schools](#)).

This view of the educational requirements of the poor remained dominant through the century. An anonymous writer to the *Gentleman's Magazine* in 1797 put it even more clearly,

Industry is the great principle of duty that ought to be inculcated on the lowest class of the people, as it is the best and most effectual barrier against vices of every kind; as it occupies the mind, and leaves no vacancy for licentious thoughts and mischievous projects...

The laborious occupations of life must be performed by those who have been born in the lowest stations; but no one will be willing to undertake the most servile employment, or the meanest drudgery, if his mind is opened, and his abilities increased, by any tolerable share of scholastic improvement: yet these employments and this drudgery must be necessarily performed... and, surely, none can be more properly fitted for this purpose than those who have been born in a state of poverty.

The man, whose mind is not illuminated by one ray of science, can discharge his duty in the most sordid employment without the smallest views of raising himself to a higher station, and can take his rest at night in perfect satisfaction and content.

His ignorance is a balm that soothes his mind into stupidity and repose, and excludes every emotion of discontentment, pride and ambition. A man of no literature will seldom attempt to form insurrections, or plan an idle scheme for the reformation of the state. (in Goldstrom 1972, p. 22,3)

Mr Davies Giddy, member of parliament, in a debate on the Parochial Schools Bill in 1807 ¹⁷², expanded on the problems of educating the poor:

['The giving of education to the laboring classes' would] be found to be prejudicial to their morals and happiness; it would teach them to despise their lot in life, instead of making them good servants in agriculture and other laborious employments to which their rank in society had destined them; instead of teaching them subordination, it would render them factious and refractory, as was evident in the manufacturing counties; it would enable them to read seditious pamphlets, vicious books, and publications against Christianity; it would render them insolent to their superiors; and, in a few years, the result would be, that the legislature would find it necessary to direct the strong arm of power towards them...
(in Goldstrom 1972, p. 29)

For these people the problem was one best dealt with by direct means:

- through finding a variety of ways of compelling the poor to work;
- reducing the circumstances of those who refused to work to such low levels that they would have no option but to accept whatever work was offered;
- and by retraining their offspring to become habituated to work.

The impact of the 18th century revivals resulted in a very different approach being employed by those who accepted that they had a duty of care for the weak and the poor.

The 19th century saw the proliferation of day schools for the poor. The aims of the schools, however, were in line with sentiments expressed through the 18th and 19th centuries. Wilmot's views on education for the poor, given above, seem to have summed up the aims of most day schools. The aims of public school education for the middle classes were rather different (though public schools did emphasize "habits of obedience and subordination to paternal as well as political authority").

An advertisement explaining the object of the Kennington District Schools, in 1824, provides a clear explanation of their purpose,

The object in forming Establishments of this nature, which now happily exist in almost every Parish and District throughout the Kingdom, is, to train the Infant Poor to good and orderly habits, - to instil into their minds an early knowledge of their civil and religious duties, - to guard them, as far as possible, from the seductions of vice, - and to afford them the means of becoming good Christians, as well as useful and industrious Members of Society: - These are the benefits proposed by the Promoters of these Schools; benefits, it is presumed, not more essential to the Children themselves, and their Parents, than to the Community at large.

(Silver and Silver 1974, p.1)

As a consequence of the 18th century revivals, Sunday Schools ¹⁷³ emerged in the second half of the century as a means of providing a rudimentary education to both children and adults in association with religious worship services.

Samuel Scriven, in his 1842 Report to Parliament, described what he considered to be the value of the Sunday schools he investigated,

There are in the district Sunday-schools belonging to the church, and to dissenters of many denominations, but chiefly to Methodists of the

"Wesleyan", "New Connexion", "Christian Association", and "Primitive" connexion. In these are congregated immense numbers of children of both sexes.

The practice of all is to open their doors at nine o'clock in the morning, and close them at half past ten, when they retire to the religious worship of their respective churches or chapels: to open again at one o'clock, and retire at half past two generally, for the same purpose, thus giving three hours of instruction deducting half an hour for prayer and singing, with which they commence their duties.

There are defects in the system of Sunday-school training, or whence arises the fact of children whose depositions I hand you from Burslem, the very pride of the potteries, their very seat of learning, being so profoundly ignorant as not to know one letter from another, and yet regularly "attend Sunday schools" my deliberate opinion is; that in an educational point of view they are not doing the good which is attributed to them: first, on account of the limitation of the hours of schooling; next; from the absence of writing, and other such secular instruction; and, thirdly, on account of the teachers; who with honour be it spoken, are eight-tenths of the working classes, yet unequal to the task of teaching.

I do not mean to detract from the merits of Sunday-schools as a source of religious knowledge, which by some is considered the basis upon which all others should be built, or from the moral effects resulting from the congregating of children in religious places; or from associating with religious friends; but would rather give my humble praise to the many sects who have with such determined efforts striven to stem the torrent of infidelity, profligacy, and drunkenness, and continue with pious zeal, in imitation of their founder, to extend the knowledge and love of God. ¹⁷⁴

And ... No Charity!! 🐦

Among the most unfortunate consequences of government 'hand-outs', in the minds of many writers of the 18th and 19th centuries, was their negative impact on the willingness of the poor to work. One of several writers quoted by ^œEdgar Furniss (1920), in examining the issue, was William Temple,

Temple wrote at a time when the poor rates were computed at two and a half millions of pounds annually and were continually on the increase; when the minds of men were filled with fresh memories of the destructive riots which the past four years had seen; when, in fact, there seemed to be lacking no evidence of the despair-engendered viciousness of the lower classes necessary to convince the short-sighted observers of the day of their innate depravity.

Temple proceeded to find the cause of this immorality in the existing laws for poor relief:

Our poor laws are at present a snare to the poor, and leave them loose to idleness, debauchery and insolence; because they depend on these laws for support in necessity; and knowing that a justice of the peace will relieve them, they despise parish officers, insult the inhabitants, and do not feel themselves obliged to their benefactors for what they receive.

It is upon the poor laws that the poor rely and not upon their own behavior and conduct; and this tends to destroy all subordination as

well as gratitude and mutual esteem. (William Temple, 1770, *Essay*)

But the writer's belief that the poor laws were responsible for the condition he decried, did not cause him to absolve the laborer from all blame for his " idleness, debauchery, and insolence."

The reaction of the laborers toward these well-intentioned efforts to ease their life conditions, was rather construed as evidence of a deep-lying moral taint in the character of the people, a proneness to evil which became pronounced in the presence of conditions in the least degree favorable to an indulgence of their congenial habits of indolence and debauchery.

Temple concluded that life had been made too easy for the laborer, that he had fallen into the evil ways so congenial to his temperament, and that necessity alone could enforce labor - the labor which the poor man owed to his nation; necessity, visualized in hard times, low wages, high prices, toil-inducing want.

This is the one strong note which sounds through the writings of the eighteenth-century social reformers, the demand for rigorous life conditions to discipline the laborer and purge his character of the evil habits of "luxury" and "sloth," a demand which takes a variety of forms during the period, advocating different expedients, all calculated to render the hard lot of the laboring classes still harder...
(Furniss 1920, pp. 106-7)

Joseph Townsend, in ^œ[*A Dissertation on the Poor Laws*](#), in 1786, provided perhaps the most rational, calculated solution to the problem of compelling the poor to work when he suggested that the best means was to strip them of all alternative means of livelihood; and reduce wages to the bare minimum required for subsistence. The problem, as many had explained through more than two centuries, was that the poor would work for only so long as they absolutely had to in order to obtain their subsistence. If they could do this in three or four days of work then they would only work for that period. So, it was clearly counterproductive to provide them with above-subsistence wages.

For Townsend, as for Mandeville, Temple, Ferguson and many other writers of the century, one of the greatest errors of reformers over the previous two centuries was that they had attempted to deal with the problem of poverty by providing welfare payments of various kinds to those who were destitute. In doing so, they expanded and perpetuated the very problem they were trying to address ¹⁷⁵.

First, Townsend states the problem, stemming, he believes ¹⁷⁶, from the old monastic system which supported the poor in their indolence and was dismantled when Henry VIII, in the early 16th century, broke up the monasteries and appropriated their possessions.

At the dissolution of the monasteries, the lazy and the indigent, who were deprived of their accustomed food, became clamorous, and, having long since forgot to work, were not only ready to join in every scheme for the disturbance of the state, but, as vagrants, by their numbers, by their impostures, and by their thefts, they rendered themselves a public and most intolerable nuisance ¹⁷⁷.

According to Townsend, these wretches, once succored by the Church and, in the main, a product of the foolishness of misplaced charity, were, with the breakup of the feudal Church in England, forced to fend for themselves.

Only, having for so long been fed and clothed by the religious communities, they no longer possessed the skills, motivation or inclination to work for their own living.

Now, according to Townsend, in the latter part of the 18th century, it was time to seriously address the problem posed by the descendants of those lazy and indigent wards of the Church. And, since the responsible people of the age now approached everything rationally, presuming that in a rational consideration of the elements of a problem the solution would become plain, this problem should be approached in that way.

There never was greater distress among the poor: there never was more money collected for their relief. But what is most perplexing is, that poverty and wretchedness have increased in exact proportion to the efforts which have been made for the comfortable subsistence of the poor; and that wherever most is expended for their support, there objects of distress are most abundant; whilst in those countries or provincial districts where the least provision has been made for their supply, we hear the fewest groans. Among the former we see drunkenness and idleness clothed in rags; among the latter we hear the chearful songs of industry and virtue.

(Townsend 1786)

So, the solution was obvious, take away charity. Misplaced charity breeds the problems it claims to address. Force the poor to fend for themselves and they will develop those skills which they presently lack. Having learned to work, they will come to enjoy it and their regions will resound to "the chearful songs of industry and virtue".

How could the state go about this without provoking widespread civil unrest? Again, Townsend claimed, to understand the solution one needed to examine measures previously tried and determine why they had failed.

Through the previous two hundred years, the major approaches to the problem of the laziness and indigence of the poor had involved legislation and social compulsion. Innumerable laws had been passed compelling the poor to work. None had succeeded. Even more laws had been passed, and draconian penalties applied to address the immorality and dishonesty of the idle poor; again, without any apparent success in dealing with the problems of crime and immorality among the poor. So, to continue with either of these seemed pointless.

The poor were clearly not motivated to work through any sense of pride in achievement, ambition or self-respect. They were 'not yet civilized'. But they must be taught to work. Best, therefore, to resort, not to manmade laws and compulsions, which are seldom successful, but to those 'natural' motives which drive human beings to labor.

Freemen should not be compelled to work, but they can be motivated by lowering their incomes to levels which will reduce them to 'the bread line'. Then they will work because they need to, and the wages they receive will lay

...a lasting and sure foundation for good will and gratitude.

The slave must be compelled to work; but the freeman should be left to his own judgment and discretion; should be protected in the full enjoyment of his own, be it much or little; and punished when he invades his neighbour's property. By recurring to those base motives which influence the slave, and trusting only to compulsion, all the

benefits of free service, both to the servant and to the master, must be lost.

(Townsend 1786)

The second half of the 18th century saw the final push to strip away small-holdings from the rural poor of Britain, making them entirely dependent on wage-labor for subsistence.

The enclosure of commons had been going on for centuries before 1760, but with nothing like the rapidity with which it has been going on since, it is known that 554,974 acres were enclosed between 1710 and 1760, while nearly 7,000,000 were enclosed between 1760 and 1845.
(Toynbee, 1884)

If the poor were going to eat, they would have to accept wage labor. And the wages they would receive would be those which the market set. Of course, in a labor market flooded by the rural dispossessed, competition for work gave employers an enormous advantage and wages dropped below amounts required for subsistence.

The [Speenhamland decrees](#) in the late 18th century allowed employers to pay "market rates" for labor, which soon drove wages below what was necessary to maintain subsistence. Parishes were required to make up the shortfall from their rates. This soon placed parish finances under great strain.

In 1834 the Poor Laws were amended to remove this 'burden' from the parishes, transferring it to the poor. After all, what had they to complain about? All they had to do was 'get a job'. As Andrew Ure insisted in 1835, many workers "pamper themselves into nervous ailments by a diet too rich and exciting for their in-door occupations"!

[Don't allow them to organize - it's Bad for Them!](#) 🚩

★ ... Before the "strike" of 1836-7, many of [the houses] were tenanted by their owners; but that unfortunate and mistaken attempt to coerce their masters, provoked by some few itinerant demagogues that visited the neighbourhood under the pretence of improving the condition of their occupants, occasioned most of them to change hands, and contributed to reduce those who were in a previous state of prosperity and happiness, to one of dependence, humiliation, and poverty, from which they have never recovered.

(Scriven Report 1842 Point 11)

★ The workmen... very seldom derive any advantage from the violence of those tumultuous combinations, which, partly from the interposition of the civil magistrate, partly from the necessary superior steadiness of the masters, partly from the necessity which the greater part of the workmen are under of submitting for the sake of present subsistence, generally end in nothing, but the punishment or ruin of the ringleaders.
(Adam Smith 1776, p. 85)

Confrontations between employers and workers were not new to the 19th century. They had occurred throughout western Europe over more than three hundred years ¹⁷⁸. And, because legal force has always favored employers and landowners ¹⁷⁹, it was inevitable that throughout the period laws would exist constraining united action on the part of workers.

Adam Smith (1776), in his most famous work, *The Wealth of Nations*, described the nature of confrontation between workers and employers in the mid 18th century; an astute description which has proved valid over the past two hundred years ¹⁸⁰.

In the 19th century and later there would be two quite distinct groups of 'workers'. One group would have its roots in the artisanal groupings of the 18th century and feel a 'natural' connection with their employers. The other group would come from 'The Poor' and bring quite different motivations and understandings with them into the 'workplace'. Both groups would confront employers with their demands, but laws would apply most effectively to the second group, to the 'working poor'.

The anti-combination laws of 1799-1800 most directly addressed the artisanal workers who were already effectively organizing at the start of the 19th century. And it was toward them that many of the restrictions on worker protest activity written into the 'repeal' of those laws during the 1820s would be directed. It would not be until the second half of the 19th century that the second group would begin to have an effective voice in protesting working conditions.

Organizations of Artisans

Christiane Eisenberg provided an account of the emergence of the 'labor aristocracy' of the 18th and 19th centuries,

The guilds split into the wealthy masters' and merchants' Livery Companies (whose functions were soon restricted to sociability) and the Yeomanries of poorer artisans, masters as well as journeymen. Most members of the Yeomanries becoming sooner or later dependent on merchants and other putters-outs, the numbers of self-employed artisans diminished.

In his 1776 *Wealth of Nations* Adam Smith wrote of twenty men working for wages for every one who was his own master. In a more recent study, this calculation has been confirmed for London, which by the end of the 18th century was by far England's largest center of artisanal production.
(1991 p. 510)

As a consequence of the 18th century Revivals, the lower middle ranking people of Western Europe were reorganized and firmly placed as an urban small-business and artisan 'class', with some of the more ambitious providing the manufacturing elites of the 19th century.

The artisanal groups provided a skilled labor force. They were allied to those whose morality and self-image came out of the 18th century revivals. They were capitalist, not pre-capitalist in orientation ¹⁸¹. They held many of the capitalist understandings of the world and attitudes toward the idle poor even more strongly than the 'old-money' middle ranking people of the time ¹⁸².

 (27/02/16)

Artisans, employing artisan apprentices of their own, either maintained their own small businesses or became attached to large manufacturing enterprises. As productive enterprises grew in size, many became either sub-contractors to those businesses or became skilled employees. Focusing on Birmingham and Sheffield, Maxine Berg described the scene in the first half of the 19th century:

From the 1820s there was a rise in the size of establishments, the introduction of machinery, and falling apprenticeship and wages. It was in this period that the balance of power shifted away from the skilled artisan to the larger scale unit.

This dramatic break between the large and small producers appeared to prevail in most of the town's industries between 1829 and 1840, whether they were 'traditional', such as tailoring or the leather trades, or new mechanised industries, such as steel-toymaking. The large-scale units dominated the town by 1840, and the small firm depended on the credit and market facilities controlled by the larger ...

Often, independent artisan producers moved by choice into the factory, where by subcontracting they could maintain the viability of their small enterprises

(1993 pp. 19, 21).

In either case, they remained detached from the 'ordinary worker', a distinct group of small-scale capitalists who supported each other and met in their own clubs and institutes¹⁸³. They increasingly needed to organize to protect their interests and, in the process, became recognized as a radical force within British society.

Inevitably, since through the later 18th and the 19th century they increasingly found themselves working in the same enterprises as the 'working poor', the distinctions between the groups blurred at the boundaries. Some of them, over time, became leaders in Union movements among the 'working poor', a 'labor aristocracy', concerned to improve the lot of less fortunate workers.

However, most remained aloof, a group with their own interests to pursue. As James Jaffe (2000) has described, even now, when unionization is weak, it is as often because workers mistrust unionization as because employers and governments deliberately attempt to prevent workers from collective bargaining.

At the start of the 19th century, articulate workers and trades-people, the artisans of the period, were as suspicious of organizations which focused on the independent rights of the laboring poor as were their employers. This made attempts at worker organization very difficult.

They were motivated by all the moral virtues of the age. They knew the importance of both industry and frugality! Christine Macleod (1999) provided a picture of:

the innovative pursuits of shop-floor inventors in the grimy workshops and factories of Victorian Britain ... It is important to emphasize that we are dealing here with the upper echelons of the working class. The 'working man' that Victorian commentators had in mind was almost certainly 'the respectable artisan',

a member of the lower-middle classes of Victorian Britain. Driven by the entrepreneurial spirit of the 18th century revivals among the 'little gentry', they provided much of the innovative force of the 19th:

It was a commonplace in mid-nineteenth-century Britain that the majority of inventors were working men, and both sides in the 'patent controversy' - reformers and abolitionists - claimed to be acting in the interests of the working-class inventor as they advocated contrary strategies.

'Generally, inventions come from the operatives', Paul Rapsey Hodge, himself an inventor, engineer and patent agent, told a parliamentary select committee in 1851. Isambard Kingdom Brunel concurred, as did patent agent Thomas Webster, who explained that,

In an established manufacture, improvement must consist in small details; the workman is better educated as to, or has more experience of, the wants of the machine than any other person.

The Manchester engineer, William Fairbairn, insisted that in larger mechanical engineering firms it was the 'working partner' (or a foreman or manager) who was responsible for most inventions, 'from his great experience and desire to expedite the work', but then explained that such a man had usually 'been originally a workman, who [had risen] by his industry and careful attention to business'. (Macleod 1999 p. 19)

Robin Pearson gave a description of some of them in the 19th century,

...the lower middle class, a heterogeneous body of tradesmen and small employers who came to dominate the public life of the industrial suburbs in the mid-Victorian decades ...

In the local press, in almanacs and histories, in lectures at political clubs, school halls and mechanics' institutes, shopkeepers and small employers invoked a community sentiment which was at once radical in its hostility to central authority, and conservative, in that it sought to maintain their hegemony in the out-townships at the expense of a labor solidarity based on class opposition.

The latter was attempted, for instance, via repeated homilies to the worker to accept his lot. Praise for the nobility of work was qualified by strictures on the need for humility and caution, "knowing one's place," both in the sense of loyalty to one's local community, and in the sense of social deference. (1993, p. 21)

The emerging lower middle classes of Britain felt as threatened (or, perhaps, more threatened because of their own social proximity) by attempts at political organization amongst the recently 'idle poor' as did their social superiors. The 'Working Classes' of Britain were composed of people like those described by Don Herzog:

...workers banded together in clubs, some more formal than others, and met in alehouses to talk about politics. One churchman catalogued the rise of "Revolutionary Clubs" figuring they meant the onset of riots and worse. Other conservatives were unhappy, too, pondering the malignant example of France's Jacobin Clubs.

In 1802, the *Leeds Mercury* printed a letter musing over such nightly meetings:

Almost every street in a large town has a little senate of this description; and the privileges of sitting in council over the affairs of the nation, and a pot of porter has long been claimed by free Britons...

(1998 p. 60)

Their experiences during the 18th century had made them suspicious about the moral reliability of those who still held political power and control of most major financial institutions ¹⁸⁴. This had left them with a reinforced

conviction of the importance of the separation of commerce and politics, and a growing belief in the moral inadequacy of state institutions, including the state church. They were even more dismissive of the poor.

Organizing the 'Working Poor'

In 1834, in response to continued concern among the middle ranks about the laziness, lack of moral fiber and costs of maintaining the 'idle poor', the Poor Laws were amended. As Thomas Carlyle wrote in 1839,

The New Poor-Law is an announcement, sufficiently distinct, that whosoever will not work ought not to live. Can the poor man that is willing to work, always find work, and live by his work?

... A man willing to work, and unable to find work, is perhaps the saddest sight that Fortune's inequality exhibits under this sun.

(Thomas Carlyle, [Chartism](#), 1885 (1839), p. 21)

John Fielden, a member of parliament and, himself, a cotton manufacturer from Lancashire, spoke against the conditions applying to the 'working poor' in 1836:

Here, then, is the "curse" of our factory-system; as improvements in machinery have gone on, the "avarice of masters" has prompted many to exact more labor from their hands than they were fitted by nature to perform, and those who have wished for the hours of labor to be less for all ages than the legislature would even yet sanction, have had no alternative but to conform more or less to the prevailing practice, or abandon the trade altogether.

This has been the case with regard to myself and my partners. We have never worked more than seventy-one hours a week before Sir JOHN HOBHOUSE'S Act was passed. We then came down to sixty-nine; and since Lord ALTHORP's Act was passed, in 1833, we have reduced the time of adults to sixty-seven and a half hours a week, and that of children under thirteen years of age to forty-eight hours in the week, though to do this latter has, I must admit, subjected us to much inconvenience, but the elder hands to more, inasmuch as the relief given to the child is in some measure imposed on the adult.

But the overworking does not apply to children only; the adults are also overworked. The increased speed given to machinery within the last thirty years, has, in very many instances, doubled the labor of both.

(^œ[John Fielden, M.P., 1836, pp. 34-35](#))

The abject poverty and destitution of vast numbers of casual and low paid workers and unemployed people through the 18th and 19th centuries makes any belief in the *Summum Bonum* ¹⁸⁵ consequences of disciplined self-interest seem myopically absurd.

If capitalism flourished and bloomed through this period, it provided little relief for the poor. A few contemporary descriptions of Manchester and similar regions, representative of a much larger body of literature from the period, paint a grim picture:

Alexis de Tocqueville, in the 1830s, described the scene as he approached Manchester:

An undulating plain, or rather a collection of little hills. Below the hills a narrow river (the Irwell), which flows slowly to the Irish sea. Two

streams (the Medlock and the Irk) wind through the uneven ground and after a thousand bends, flow into the river. Three canals made by man unite their tranquil lazy waters at the same point. On this watery land, which nature and art have contributed to keep damp, are scattered palaces and hovels.

Everything in the exterior appearance of the city attests the individual powers of man; nothing the directing power of society. At every turn human liberty shows its capricious creative force. There is no trace of the slow continuous action of government. Thirty or forty factories rise on the tops of the hills I have just described. Their six stories tower up; their huge enclosures give notice from afar of the centralisation of industry.

The wretched dwellings of the poor are scattered haphazard around them. Round them stretches land uncultivated but without the charm of rustic nature and still without the amenities of a town ... Some of [the] roads are paved, but most of them are full of ruts and puddles into which foot or carriage wheel sinks deep ...

Heaps of dung, rubble from buildings, putrid, stagnant pools are found here and there amongst the houses and over the bumpy, pitted surfaces of the public places ...

Amid this noisome labyrinth from time to time one is astonished at the sight of fine stone buildings with Corinthian columns ... But who could describe the interiors of those quarters set apart, home of vice and poverty, which surround the huge palaces of industry and clasp them in their hideous folds?

On ground below the level of the river and overshadowed on every side by immense workshops, stretches marshy land which widely spaced muddy ditches can neither drain nor cleanse. Narrow twisting roads lead down to it. They are lined with one-storey houses whose ill-fitting planks and broken windows show them up, even from a distance, as the last refuge a man might find between poverty and death.

Nonetheless the wretched people reduced to living in them can still inspire jealousy of their fellow beings. Below some of their miserable dwellings is a row of cellars to which a sunken corridor leads; twelve to fifteen human beings are crowded pell-mell into each of these damp, repulsive holes.

(^c1958, pp.105-6)

James Kay described an area of Manchester between 1831 and 1844,

The cottages are very small, old and dirty, while the streets are uneven, partly unpaved, not properly drained and full of ruts. Heaps of refuse, offal and sickening filth are everywhere interspersed with pools of stagnant liquid. The atmosphere is polluted by the stench and is darkened by the thick smoke of a dozen factory chimneys.

A horde of ragged women and children swarm about the streets and they are just as dirty as the pigs which wallow happily on the heaps of garbage and in the pools of filth.

In short, this horrid little slum affords as hateful and repulsive a spectacle as the worst courts to be found on the banks of the Irk. The inhabitants live in dilapidated cottages, the windows of which are broken and patched with oilskin. The doors and the door posts are broken and rotten.

The creatures who inhabit these dwellings and even their dark, wet cellars, and who live confined amidst all this filth and foul air-which cannot be dissipated because of the surrounding lofty buildings-must surely have sunk to the lowest level of humanity.

That is the conclusion that surely must be drawn even by any visitor who examines the slum from the outside, without entering any of the dwellings. But his feelings of horror would be intensified if he were to discover that on average 20 people live in each of these little houses, which at the moment consist of 2 rooms, an attic and cellar. One privy - and that usually inaccessible - is shared by about 120 people.

In spite of all the warnings of the doctors and in spite of the alarm caused to the health authorities by the condition of Little Ireland during the cholera epidemic, the condition of this slum is practically the same in this year of grace 1844 as it was in 1831.

(from *The Moral and Physical Condition of the Working Classes* by James Phillips Kay MD (1844))

Phil Chapple provides a glimpse into conditions in Preston in 1844,

A visitor entering Queen Street, finds himself facing a row of privies of more than 100 yards long. The doors of the privies are about 6 feet from the house doors opposite and the space between one privy and another is filled up with all imaginable and unimaginable filth; so that the street consists of passages little more than 6 feet wide, with dwelling houses on one side and a continuous range of necessaries, pigsties and middens on the other, with a filthy surface drain running along one side ... 12 houses have their only outlets upon this disgusting and pestiferous passage.

The working-class slums of the mid-19th century English industrial town have fascinated and horrified social historians for decades. The example above, from the Reverend J. Clay's report on Preston in 1844, presented a vision of squalor repeated many times over across industrial urban England.

In such environments children were born, lived, played and worked, and for hundreds of thousands life was short and brutal ... While industrialization and urbanization undoubtedly brought about great national wealth, they also produced misery ...
(Chapple 2000, p. 42)

Attempts by the 'working poor' to improve their lot were strongly resisted through both centuries.

In 1835 Andrew Ure examined conditions in factories, with a typical middle ranking understanding of the world in which he lived. As he explained,

It seems established by a body of incontestable evidence, that the wages of our factory work-people, if prudently spent, would enable them to live in a comfortable manner, and decidedly better than formerly, in consequence of the relative diminution in the price of food, fuel, lodgings, and clothing. (p.306)

Earlier in the same publication he described the problem of workers' agitation against their conditions,

The textile manufactures consist of two distinct departments; one carried on by multitudes of small independent machines belonging to

the workmen, another carried on by concatenated systems of machinery, the property of the masters ...

The operatives of the latter class are necessarily associated in large bodies, and moreover have no capital sunk in machinery or work-shops. When they choose to strike they can readily join in the blow, and by stopping they suffer merely the loss of wages for the time, while they occasion to their master loss of interest on his sunk capital, his rent, and his taxes, as well as injury to the delicate moving parts of metallic mechanisms by inaction in our humid climate.

There are several cotton-mills in Manchester, of which the interest on sunk capital amounts to from 5,000l. to 10,000l. per annum. If we add to the loss of this interest, that of the profit fairly resulting from the employment of the said capital, we may be able to appreciate in some measure the vast evils which mischievous cabals among the operatives may inflict on mill-owners, as well as on the commerce of the country ...

Proud of the power of malefaction, many of the cotton-spinners, though better paid, as we have shown, than any similar set of artisans in the world, organized the machinery of strikes through all the gradations of their people, *terrifying*, *cajoling* the timid or the passive among them to join their vindictive union.

They boasted of possessing a dark tribunal, by the mandates of which they could paralyze every mill whose master did not comply with their wishes, and so bring ruin on the man who had given them profitable employment for many a year. By flattery or intimidation, they levied contributions from their associates in the privileged mills, which they suffered to proceed, in order to furnish spare funds for the maintenance of the idle during the decreed suspension of labor.

In this extraordinary state of things, when the inventive head and the sustaining heart of trade were held in bondage by the unruly lower members, a destructive spirit began to display itself among some partisans of the union. Acts of singular atrocity were committed, sometimes with weapons fit only for demons to wield, such as the corrosive oil of vitriol, dashed in the faces of most meritorious individuals, with the effect of disfiguring their persons, and burning their eyes out of the sockets with dreadful agony.

The true spirit of turn-outs among the spinners is well described in the following statement made on oath to the Factory Commission, by Mr. George Royle Chappel, a manufacturer of Manchester, who employs 274 hands, and two steam-engines of sixty-four horse power.

I have had several turn-outs, and have heard of many more, but never heard of a turn-out for short time. I will relate the circumstances of the last turn-out, which took place on the 16th October, 1830, and continued till the 17th January, 1831. The whole of our spinners, whose average (weekly) wages were 2l. 13s. 5d., turned out at the instigation, as they told us at the time, of the delegates of the union. They said they had no fault to find with their wages, their work, or their masters, but the union obliged them to turn out.

The same week three delegates from the spinners' union waited upon us at our mill, and dictated certain advances in wages, and other regulations, to which, if we would not adhere, they said

neither our own spinners nor any other should work for us again! Of course we declined, believing our wages to be ample, and our regulations such as were necessary for the proper conducting of the establishment.

The consequences were, they set watches on every avenue to the mill, night and day, to prevent any fresh hands coming into the mill, an object which they effectually attained, by intimidating some, and promising support to others (whom I got into the mill in a caravan), if they would leave their work. Under these circumstances I could not work the mill, and advertised it for sale, without any applications, and I also tried in vain to let it.

At the end of twenty-three weeks the hands requested to be taken into the mill again on the terms that they had left it, declaring, as they had done at first, that the union alone had forced them to turn out. The names of the delegates that waited on me were, Jonathan Hodgins, Thomas Foster, and Peter Madox, secretary to the union.

(Andrew Ure 1835 pp. 281-4)

Andrew Ure's account of the duplicity and greed of workers in the cotton industry who "pamper themselves into nervous ailments by a diet too rich and exciting for their in-door occupations" is representative of many middle class writings on attempts at unionization by the working poor during the first half of the 19th century. As he continues,

We have seen that the union of operative spinners had, at an early date, denounced their own occupations as being irksome, severe, and unwholesome in an unparalleled degree. Their object in making this misrepresentation was obviously to interest the community in their favor at the period of their lawless strike in the year 1818.

Subsequently to this crisis, some individuals of their governing committee made the notable discovery, that if the quantity of yarn annually spun could by any means be reduced, its scarcity in the market would raise its price, and consequently raise the rate of their wages. They accordingly suggested the shortening of the time of labor to ten hours, as the grand remedy for low wages and hard work; though at this time they were receiving at least three times more wages than hand-loom weavers for the same number of hours' employment, and therefore had very little reason to complain of their lot.

In fact, it was their high wages which enabled them to maintain a stipendiary committee in affluence, and to pamper themselves into nervous ailments by a diet too rich and exciting for their in-door occupations. Had they plainly promulgated their views and claims, they well knew that no attention would have been paid to them, but they artfully introduced the tales of cruelty and oppression to children, as resulting from their own protracted labor, and succeeded by this stratagem to gain many well meaning proselytes to their cause. (1835, pp. 298-9)

William Booth, a Methodist evangelist, at the end of the 19th century could still say,

Alas, what multitudes there are around us everywhere, many known to my readers personally, and any number who may be known to them by a very short walk from their own dwellings, who are in this very plight!

Their vicious habits and destitute circumstances make it certain that without some kind of extraordinary help, they must hunger and sin, and sin and hunger, until, having multiplied their kind, and filled up the measure of their miseries, the gaunt fingers of death will close upon them and terminate their wretchedness.

And all this will happen this very winter in the midst of the unparalleled wealth, and civilization, and philanthropy of this professedly most Christian land.

(Booth 1890, Preface)

These conditions had first emerged some three hundred years earlier. They had grown steadily worse over two hundred years. Capitalism was built on these foundations ¹⁸⁶.

In the second half of the 19th century, with wealth flowing to Britain from its considerable empire, conditions for the poor slowly improved. Robert Steinfeld (2007) has given a succinct explanation of the freedoms won by workers' unions in the 1870s:

the "Employers and Workmen Act," which eliminated criminal penalties for breaches of employment contracts in most cases, and the "Conspiracy and Protection of Property Act," which repealed the Criminal Law Amendment Act, revised the controversial picketing clause, and completely removed trade disputes between employers and workmen from the reach of the common law of criminal conspiracy ¹⁸⁷.

While still oppressive, conditions for the 'laboring poor' of Britain were changing for the better. They were rapidly deteriorating for colonial populations.

Conclusion 🐦

★ ... If the love of money is the root of all evil, the want of money is the cause of an immensity of evil and trouble. The moment you begin practically to alleviate the miseries of the people, you discover that the eternal want of pence is one of their greatest difficulties.

In my most sanguine moments I have never dreamed of smoothing this difficulty out of the lot of man, but it is surely no unattainable ideal to establish a Poor Man's Bank, which will extend to the lower middle class and the working population the advantages of the credit system, which is the very foundation of our boasted commerce.

It might be better that there should be no such thing as credit, that no one should lend money, and that everyone should be compelled to rely solely upon whatever ready money he may possess from day to day. But if so, let us apply the principle all round; do not let us glory in our world-wide commerce and boast ourselves in our riches, obtained, in so many cases, by the ignoring of this principle.

If it is right for a great merchant to have dealings with his banker, if it is indispensable for the due carrying on of the business of the rich men that they should have at their elbow a credit system which will from time to time accommodate them with needful advances and enable them to stand up against the pressure of sudden demands, which otherwise would wreck them, then surely the case is still stronger for providing a similar resource for the smaller men, the weaker men.

At present Society is organized far too much on the principle of giving to him who hath so that he shall have more abundantly, and taking away from him who hath not even that which he hath.

If we are to really benefit the poor, we can only do so by practical measures. We have merely to look round and see the kind of advantages which wealthy men find indispensable for the due management of their business, and ask ourselves whether poor men cannot be supplied with the same opportunities. The reason why they are not is obvious. To supply the needs of the rich is a means of making yourself rich; to supply the needs of the poor will involve you in trouble so out of proportion to the profit that the game may not be worth the candle.

Men go into banking and other businesses for the sake of obtaining what the American humorist said was the chief end of man in these modern times, namely, "ten per cent." To obtain a ten per cent. what will not men do? They will penetrate the bowels of the earth, explore the depths of the sea, ascend the snow-capped mountain's highest peak, or navigate the air, if they can be guaranteed a ten per cent. I do not venture to suggest that the business of a Poor Man's Bank would yield ten per cent., or even five, but I think it might be made to pay its expenses, and the resulting gain to the community would be enormous.

Ask any merchant in your acquaintance where his business would be if he had no banker, and then, when you have his answer, ask yourself whether it would not be an object worth taking some trouble to secure, to furnish the great mass of our fellow countrymen, on sound business principles with the advantages of the credit system, which is found to work so beneficially for the "well-to-do" few.

Some day I hope the State may be sufficiently enlightened to take up this business itself; at present it is left in the hands of the pawnbroker and the loan agency, and a set of sharks, who cruelly prey upon the interests of the poor.

The establishment of land banks, where the poor man is almost always a peasant, has been one of the features of modern legislation in Russia, Germany, and elsewhere. The institution of a Poor Man's Bank will be, I hope, before long, one of the recognized objects of our own government. (œWilliam Booth (1890))

William Booth was a Methodist preacher. He would found a movement, *The Salvation Army*, which still, today, accepts a deep responsibility for providing practical help (in Booth's words, 'soup, soap and salvation') to the poor ¹⁸⁸. His practical approach to poverty was based on the tried and true principles of Methodism ¹⁸⁹. Their influence on both policies and practice in 'reforming the poor' would lead to the development of 'welfare' programs both by other religious organizations and Western governments. The wastelands of Western Europe and its offspring would slowly but surely be converted into a 'lower middle capitalist class'.

True to the vision of John Wesley, the mission to redeem the lost would not stop with the poor of London, or even of Western Europe. Western Europeans now had vast colonial territories. There was a new wasteland - vast and daunting in its scope - and Western Europeans could not escape their God-given responsibility for reclaiming it, bringing 'soup, soap and salvation' to the lost. The West knew that it was destined to bring 'civilization' and 'development' to the populations of the world.

One could paraphrase the song 'Streets of London', written by Ralph McTell in 1969,

So how can you tell me you're lonely,
And say for you that the sun don't shine?
Let me take you by the hand and lead you through the streets
of - *any of a thousand slums around the world*
I'll show you something to make you change your mind.

Chapter 6: Capitalism and Work: the White Man's Burden †

The nature of work

The White Man's Burden

- Getting things into Perspective!
- The 'Development' Business
- Of globalization and 'Failing States'
- The Decay of Western Influence

Work discipline, titles of consumption and status

- The Computer Revolution
- Life Beyond 'Work': What fate awaits human beings and their societies?
- Globalization, Free Trade Zones and Definitions of Employment
- Distinction between Labor and work
- The Able-bodied and the Disabled - The Deserving Poor

Work and its antonyms

- Work and leisure

The organization of work

Teaching Western Europeans to work

The morality of work

From indolent subsistence to Labor-pool Worker

- Teaching 'The Poor' to work
- Teaching 'The Natives' to work

Conclusion

- A Personal Observation

Western people do not work in order to live.
They live to work!

★ The nigger is a lazy beast and must be compelled to work - compelled by Government - with a stick.
(Sir Rudolph Slatin ¹⁹⁰ (in Gilbert Murray ^{œ1900 p. 135}))

★ Suppose that, at a given moment, a certain number of people are engaged in the manufacture of pins. They make as many pins as the world needs, working (say) eight hours a day.

Someone makes an invention by which the same number of men can make twice as many pins as before. But the world does not need twice as many pins: pins are already so cheap that hardly any more will be bought at a lower price.

In a sensible world, everybody concerned in the manufacture of pins would take to working four hours instead of eight, and everything else would go on as before. But in the actual world this would be thought demoralising. The men still work eight hours, there are too many pins, some employers go bankrupt, and half the men previously concerned in making pins are thrown out of work.

There is, in the end, just as much leisure as on the other plan, but half the men are totally idle while half are still overworked. In this way, it is

insured that the unavoidable leisure shall cause misery all round
instead of being a universal source of happiness. Can anything more
insane be imagined?
(Russell 1935 pp.16,17)

The White Man's Burden

The 19th century was the century in which unregulated capitalism lay at the heart of most Western European public and private policy and practice. It was the century in which 'The Poor', long a vexing problem for responsible people - and, of course, a source of cheap labor and profit for capitalist enterprise - were taught to work.

By the end of the century, life was slowly improving for Western Europe's poor. But, for the responsible middle classes of Western Europe, the job was far from complete! A new 'Poor' had been found, indigent and slothful, in need of discipline and direction, in the extensive colonies for which they had accepted responsibility.

The next century would be the one in which Western working poor slowly gained legal rights and entitlements, enshrined in labor awards ¹⁹¹. The wealth flowing into Western countries from the rest of the world would bring increasing material prosperity, improved living conditions, healthier diets, and even, for a period, the chance to pursue 'leisure' activities. This would not be true for the inhabitants of Europe's colonial empires.

The 19th was not only the century when The Poor learned to work. It was also the century of Western European colonial expansion. Populations around the world found themselves included, whether they liked it or not, in Western European empires.

A 1990 editorial in *The Ecologist* provides a bleak picture of a prime purpose of that expansion:

"History", wrote the French philosopher Voltaire, "is a fable upon which we are all agreed". So far as the colonial period goes, the fable would have us believe that the colonial powers were primarily motivated by a desire to bring "progress" and "civilization" to their colonies. Whilst this may indeed have been true of the missionaries who trail-blazed Europe's colonial expansion, it was far from the minds of the main architects of colonial rule.

Contemporary writings... ¹⁹² make it clear that for the governments of the day, the principle justification for colonialism was unashamedly economic. Colonies provided the means by which the metropolitan powers could secure access to cheap food, cheap raw materials and labor, new markets for manufactured goods and new investment opportunities. It was as simple as that.

(^œ*Ecologist* Vol 20 No 6 1990 p. 202)

^œHirst, Murray and Hammond (1900) examined the formation of and conduct in British colonies in a book entitled *Liberalism and The Empire* :

Our colonies, like most other colonies, owe their original existence, in one sense or another, to mere adventure or the power of the sword. They owe their vitality and strength, and most of the finer characteristics which make them almost unique in the history of colonization, to very different causes: to the policy of non-interference, to the studied avoidance of aggression, to toleration and generous amity between conflicting creeds and diverse races, to Liberal principles and Liberal ideas.

...Authority, force, firmness, the detection of offences, the assertion of rightful claims and the punishment of enemies, are, no doubt,

principles of great power and value in the world as it now stands; but they are not, and never have been, sufficient alone.

Self-criticism, persuasion, patience, a wise blindness to offences, a reluctance to stand on the outermost edge of every right, the appeasement of enmities, are principles also of great and, one used to hope, of increasing value.

...A fabric of human lives so vast as that for which Her Majesty's Government is now responsible surely demands for its good guidance both high principles and profound prudence.

...There is no sentiment in a nation so dangerous, there is no sentiment so easy to stimulate, as the false excess of patriotism ¹⁹³.
(1900 Preface pp. v, vi, xi)

Gilbert Murray (1900) in an essay entitled *The Exploitation of Inferior Races...* provided a summary of common colonial practice toward 'the natives' in British colonial territories,

The 'corvee' or forced labor system, which implied a kind of formal, though very limited, 'slavery', is said to be still practised in some parts of British India, and exists in a very severe form in Natal. In Egypt it was abolished by us some years ago, but seems - though the statement has been denied - to have been reintroduced during the Soudan campaign under irregular and therefore exasperating conditions (Daily News, March 8, 1899).

In the Soudan itself we have, of course, recently proclaimed the formal abolition of slavery. The system we propose to substitute for it has been lucidly described by Sir Rudolph Slatin in an interview which appeared in several newspapers. [For instance, Daily Mail, March 11, 1899. 135]

'The nigger is a lazy beast,' said Slatin, 'and must be compelled to work - compelled by Government.' 'How?' asked his interlocutor. 'With a stick,' was Slatin's reply. Those who have followed the course of Slatin's singular career can perhaps form some notion of the probable weight of that stick!
(^œ1900 p. 135)

J. L. Hammond (1900) in an essay entitled *Colonial and Foreign Policy*, summed up the British attitudes and responsibilities to its empire,

It is the major premiss of the Imperialist argument that British civilization is the best in the world...

The moral hegemony of the world which we have undertaken - we are ready to share it with America when she behaves herself to our satisfaction or when Europe is more than usually insolent - might be expected to imply that our conduct and our influence should act as a beneficent example upon other States. The phrase is that we are the schoolmasters of Europe...

As schoolmasters we are told that we stand outside the discipline of the school. Mr. Bryce has shown that during the negotiations with the Transvaal Government we contrived to provoke war before we had discovered a *casus belli* ¹⁹⁴.

It is not pretended that these negotiations would have been so conducted if we had been dealing with a Great Power, or, indeed, if we

had known the strength of the Transvaal. In other words, we were taking advantage of our physical superiority.

And how is that course of action defended? By reminding ourselves of our missionary character! By recalling all the blessings which the world will reap from the extension of our Empire!

(in Hirst *et al* (1900) pp. 174-5)

Getting things into Perspective! 🐼

Perspective is everything in understanding the real world.

From the Western European perspective, their colonies demonstrated their civilized approach to their responsibilities in life. Francis Hirst (1900, p. v) explained why:

They owe their vitality and strength, and most of the finer characteristics which make them almost unique in the history of colonization... to the policy of non-interference, to the studied avoidance of aggression, to toleration and generous amity between conflicting creeds and diverse races...

It all looked very different from the colonial perspective ¹⁹⁵.

In a book entitled *Path to Nigerian Freedom*, Obafemi Awolowo, later to be a prominent Yoruba politician in independent Nigeria, spelled out his view of the nature of the colonial territory known as Nigeria and of the relationship between Nigerians and their colonial masters:

The conquest of one nation by another in an unprovoked act of aggression cannot be justified by any standard of morality. Britain came to Nigeria of her own choosing, and with motives which are only too well known. She sought to impose her rule on the various tribes that inhabited the country in order to attain her own selfish ends.

There was then no question of trusteeship. This was the result of a later compunction of conscience which usually dawns on any evil-doer who is not hardened beyond redemption.

Those tribes with whom she first came into contact resisted the unwarranted attack on their political independence. They were overpowered by force of arms. Thereafter, each tribe was faced with a choice of one of two roads leading to subjection: defeat or surrender...

There are various national or ethnical groups in the country. Ten main groups were recorded during the 1931 census as follows: (1) Hausa, (2) Ibo, (3) Yoruba, (4) Fulani, (5) Kanuri, (6) Ibibio, (7) Munshi or Tiv, (8) Edo, (9) Nupe, and (10) Ijaw. According to Nigeria Handbook, 15th edition, 'there are also a great number of other small tribes too numerous to enumerate separately...'

It is a mistake to designate them 'tribes'. Each of them is a nation by itself with many tribes and clans. There is as much difference between them as there is between Germans, English, Russians and Turks for instance. The fact that they have a common overlord does not destroy this fundamental difference...

All these incompatibilities among the various peoples in the country militate against unification.... It is evident from the experiences of other nations that incompatibilities such as we have enumerated are barriers which cannot be overcome by glossing over them.

(Awolowo 1947, pp. 24,48-9)

A passage from a 1924 speech ¹⁹⁶ by Prince Marc Kojo Tovalou Houènou, a Dahomeyan (now Benin) who fought for France in the 1st World War, provided a bleak African perspective on the 'colonial experience':

Europe has inaugurated in the Colonies an area of veritable savagery and real barbarism which is carried out with science and premeditation - with all the art and all the refinement of civilization. The unfortunate natives have mingled their destinies with yours...

We understand nothing of the egotistic and barbarous aims sought by certain civilized people who believe that civilization can only reach its zenith by ignoring original laws, and by debasing and enslaving men who have the natural right to live, to evolve, and to attain the full expression of their being...

...The problem arose at the moment of the discovery of America when Europeans intoxicated by glory, adventure, and above all by rapine, sought to conquer new territories which did not belong to them.

They destroyed the aborigines - exterminated them! Then, terrified at the void they had created around them and being themselves incapable of labor, they turned to Africa for workmen. It was Africa that furnished contingents for penal labor - this Africa with whose unhappy history you are unacquainted but which some day, one of her sons will outline for you in darts of fire, - a monument of shame for that civilization of which you boast.

Without humanity there is no civilization!

If the monsters, full of vice, sodden with alcohol, contaminated by disease, whom you send to us, have nothing else to offer than what they have already given us, then keep them yourselves, and let us revert to our misery and our barbarity. The whole fatality that burdens Eschyllian tragedies cannot compare with the blackness of the African tragedy.

Under cover of civilization, men are hunted like deers, plundered, robbed, killed; and these horrors are presented afterwards in eloquent orations as blessings. Hypocrisy and knavery are added to crimes!
(^œHouènou (1924) 1979, pp. 228,9)

By the end of the 19th century, Western European nations had divided the world amongst themselves. As Awolowo (1947) claimed of British practice:

Those tribes with whom she first came into contact resisted the unwarranted attack on their political independence. They were overpowered by force of arms. Thereafter, each tribe was faced with a choice of one of two roads leading to subjection: defeat or surrender.

Hillaire Belloc put it well in a poem ¹⁹⁷ which celebrated the deployment of the first Vickers machine gun (the Maxim). The British South Africa Company used several of them in what was euphemistically called a 'war' against the Ndebele in Matabeleland (southern Zimbabwe) in November 1893 (Blood was a Maxim gunner's name):

I shall never forget the way
That Blood stood on this awful day
Preserved us all from death.
He stood upon a little mound
Cast his lethargic eye around,
And said beneath his breath;

'Whatever happens, we have got
The Maxim Gun, and they have not.'

As a popular British song of the period put it:

Some talk of Alexander,
And some of Hercules
Of Hector and Lysander,
And such great names as these.
But of all the world's great heroes,
There's none that can compare
With a tow, row, row, row, row, row,
To the British Grenadier

Millions of people around the world found themselves included within European empires, their lives reorganized to ensure that they, like The Poor of Western Europe in previous centuries, learned to work. There was a great deal to be done, and the responsible people of Western Europe, as 'schoolmasters' to the world, knew that they had a duty to ensure that 'the natives' (the Western colonial term for 'The Poor' of the world) learned to work.

An introduction to the summary of the UNESCO (2002) ¹⁹⁸*International Symposium on Post-Development* has phrased it well,

By 1914, 84.4 % of the world's terrestrial area had been colonized by the Europeans. With colonization there came a new paradigm of development.

...According to many voices the paradigm of development has not changed. It emerges in new forms, in the current pursuit of neoliberal globalization.

According to François Partant, the French banker-turned-critic of development;

the developed nations have discovered for themselves a new mission - to help the Third World countries advance along the same road to development which is nothing more than the road on which the West had guided the rest of humanity for several centuries.

[Partant, F., *La Fin du Développement*, François Maspero, Paris, 1982]

As any well enculturated Western European would have told you ¹⁹⁸, colonialism, no matter what a few leftist trouble-makers and opportunists might say, was *not* about 'exploiting' the natives. They were children in need of parental direction, supervision and discipline. In their child-like simplicity they simply did not realize the true potential of the lands within which they lived and their true responsibilities before God. They had been living from hand-to-mouth and had neither the intelligence nor skills needed to realize their own potential.

It was the responsibility of Western Europeans to 'teach them the practice of frugality and industry' which they themselves had learned over four centuries - to 'develop' them ¹⁹⁹. At the end of the 19th century, this was Western Europe's inescapable responsibility. It was 'the White Man's burden'.

Rudyard Kipling (1899) ²⁰⁰ explained it:

Take up the White Man's burden -
Send forth the best ye breed -
Go bind your sons to exile
To serve your captives' need;
To wait in heavy harness,
On fluttered folk and wild -
Your new-caught, sullen peoples,
Half-devil and half-child.

...To seek another's profit,
And work another's gain.

...Watch sloth and heathen Folly
Bring all your hopes to nought.

Take up the White Man's burden -
And reap his old reward:
The blame of those ye better,
The hate of those ye guard -
The cry of hosts ye humor
(Ah, slowly!) toward the light: -
"Why brought he us from bondage,
Our loved Egyptian night?"

...Take up the White Man's burden -
Have done with childish days -
The lightly proffered laurel,
The easy, ungrudged praise.
Comes now, to search your manhood
Through all the thankless years
Cold, edged with dear-bought wisdom,
The judgment of your peers!
(Rudyard Kipling *McClure's Magazine* 1899)

They would go where civilized people had never before ventured, assume the heavy duties of parenthood, and shine the light of civilization and the Gospel into the 'spiritual darkness' of 'heathen lands'.

Lowell Mason had expressed it well in a missionary hymn written in 1823,

From Greenland's icy mountains, from India's coral strand;
Where Afric's sunny fountains roll down their golden sand:
From many an ancient river, from many a palmy plain,
They call us to deliver their land from error's chain.

What though the spicy breezes blow soft o'er Ceylon's isle;
Though every prospect pleases, and only man is vile?
In vain with lavish kindness the gifts of God are strown;
The heathen in his blindness bows down to wood and stone.

Shall we, whose souls are lighted with wisdom from on high,
Shall we to those benighted the lamp of life deny?
Salvation! O salvation! The joyful sound proclaim,
Till earth's remotest nation has learned Messiah's Name.

Waft, waft, ye winds, His story, and you, ye waters, roll
Till, like a sea of glory, it spreads from pole to pole:
Till o'er our ransomed nature the Lamb for sinners slain,
Redeemer, King, Creator, in bliss returns to reign.

Western Europeans were on a millenarian mission ²⁰¹. Good would triumph over evil, order over chaos, frugality and industry over improvidence and indolence. Responsible people, whose souls were 'lighted with wisdom from on high', had a duty to those who 'call us to deliver their land from error's chain'. And, a duty to ensure that all was in readiness for the arrival of that millenarian golden age. If this entailed a little harshness, discipline and social disruption, that was unfortunate but necessary!

All schoolmasters knew that true learning requires obedience. As Sir John Eardley Wilmot had explained in the late 18th century,

to break the natural ferocity of human nature, to subdue the passions and to impress the principles of religion and morality, and give habits of obedience and subordination to paternal as well as political authority, is the first object to be attended to by all schoolmasters who know their duty and do it.

(*The Gentleman's Magazine* (1811) Volume 109 p. 449 (originally in Volume 73 p. 136))

Middle class Western Europeans had learned the lessons of their own history well.

The resolute firmness of the person who acts in this manner, and in order to obtain a great though remote advantage, not only gives up all present pleasures, but endures the greatest labor both of mind and body, necessarily commands our approbation.

(Adam Smith 1759 Part 4 Ch. 2)

The 'Development' Business 🐼

'The natives' would never progress or become 'developed' without Western European help. Richard Whateley, Archbishop of Dublin, in 1854, had explained the problem,

Men, left in the lowest, or even anything approaching the lowest, degree of barbarism, in which they can possibly subsist at all, never did, and never can raise themselves, unaided, into a higher condition. (in Campbell 1871 Pt 1 P.1)

Unless those already enlightened took responsibility for enlightening those who lived in darkness they would continue in ignorance and sloth!

Missionary attitudes in central Africa in the 19th century, and on into the 20th, have been summed up neatly by Cairns,

The proper attitude was indicated by Carson of the L. M. S. [London Missionary Society] who, after noting that African men spent 'much time in indolence', remarked that it was inconceivable 'how the practice of that vice in the African race can be supposed to conduce to happiness in them when it makes us so miserable'.

(1965, p. 80)

Western European 'responsible' people of the middle ranks had taught their own poor the evil of sloth and the virtue of work over more than six centuries ²⁰². They brought both the experiences and practices they had acquired in doing so with them as they tackled the problem in their colonies.

As they had determinedly set about teaching the poor to work, they had also taught *themselves* that work was indispensable to a moral life. The Western European middle classes which took responsibility for reorganizing

vast areas of the world during the later 19th and the 20th centuries, were committed to work, for its own sake. It was *moral* to work and *immoral* not to do so.

In the words of Adam Smith, asserted by countless other writers of the 17th to 20th centuries (and still being asserted today), the lives of virtuous people would and should demonstrate,

a steady perseverance in the practice of frugality, industry, and application, though directed to no other purpose than the acquisition of fortune.

(1759 Part 4 Ch. 2)

Western middle classes became and have remained convinced that everyone *should* work for their living and that they have a responsibility to ensure that the indolent *do* learn to work. To appreciate the driving force of the invasion of the world by Western Europeans over the past two centuries, we need to understand the Western belief in the fundamental importance of work, for its own sake, for its character building potential.

Of course the West invaded (and continues to invade) the world for its resources. Of course the West has profited from its appropriation of the environments of others. But they have done so for the best of all possible reasons.

They were and are in the 'Development' business! ²⁰³ In 'developing' the territories of the world, they were enabling the 'development' of their inhabitants. They were bringing order to the chaos of their lives, they were providing them with the opportunity to work. They were in the 'job creation' and 'work training' business!

Russell's observations, with which we started this discussion, highlight the inevitable consequences of human beings building particular understandings into their primary ideologies ²⁰⁴. Work became a form of organization and activity which no longer needed to be 'explained'. To question its importance was either absurd or subversive. To suggest that the working day should be halved, was foolish. To suggest that work was not of equal importance everywhere on earth was equally silly. The reason why the rest of the world was impoverished and 'backward' was that they did not know how to 'put in a full day's work' ²⁰⁵.

Over the past seven hundred years Western individuals and communities have progressively been reorganized and reoriented to what we now know as *economic* principles and practices ²⁰⁶. People *know* that the economic presumptions contained within and expressed through the forms of organization within which they are enmeshed are correct, they make *intuitive sense* ²⁰⁷.

The need for constant expansion of self-interested consumption and accumulation, as evidences of commitment to work, is built into the primary ideologies of Western communities. Western people are not *ensnared* in the forms of meaning and organization and processes of interaction and activity within which they find themselves. If those forms were not there, they would feel compelled to create them or something very similar to them. Indeed, they have done precisely this through most of the world as they have gained influence in other communities ²⁰⁸.

Although Western people *think* the principles which underpin the forms of organization and interaction in terms of which they organize their lives, they have not always thought in these ways or organized their lives by the

fundamental economic principles which now govern life. The emergence of "modern" ways of thinking and organizing life was slow and painful for most Western Europeans ²⁰⁹.

The majority of people, during the 16th to early 20th centuries, had to be *taught* to take these principles seriously, and the disciplines imposed on them by those Western Europeans who gained control of government and who were already thinking in these ways were harsh ²¹⁰.

Since the basic presumptions and principles of thought of a community determine all the behaviors and interactions of its people, they cannot easily be altered. Attempts at such radical social engineering inevitably disrupt communities and confuse and confound the minds of their members ²¹¹. Western Europe did not escape cultural confusion as its cognitive frame changed. As Foucault (1971) described, in Western Europe it produced, over several centuries, a pervasive awareness of uncontrolled madness in the minds of most people.

During the seven centuries it took Western communities to shift from feudalism to modern ways of thinking, the constantly expanding "middle classes" ²¹² recognized a deep responsibility for re-educating the "lower classes" ²¹³.

The final triumph of modern ways of thinking in Western communities has been heralded over the past 50 years by the progressive disappearance of the "lower classes" as more and more people who come from such backgrounds have begun to think and act in middle class ways ²¹⁴. With the advent of colonial empires, Western middle classes found themselves with a similar responsibility to 'the natives' of the world.

Of Globalization and 'Failing States'

When human beings are convinced of the rightness of their causes they usually feel a moral responsibility to compel those who don't understand or live by the principles which underpin their lives to conform to them.

We have seen the disastrous consequences of this many times in the 20th and 21st centuries. From Stalin, to Hitler, to Pol Pot, to the ethnic-cleansings of the 1990s, to numerous wars waged by both Western and other communities, human beings have amply demonstrated their insistence that those who are weaker than they should be made to think and live as they do.

Western Europeans have been engaged in such a mission for the past several centuries, and chief amongst their concerns has been the need to convince people everywhere of the importance of *work*.

Western people are, of course, not the only ones enmeshed in home-grown systems of meaning, organization and interaction. This is the condition of humanity. People, everywhere, organize themselves and their worlds in ways which are consonant with their forms of categorization and classification.

The problem, in trying to understand both ourselves and others, is that, just as the languages of people are historically determined and unique to the communities which speak them, so are the forms of organization and interaction in communities. They are expressions of the underlying principles of categorization and classification which have been historically, and subconsciously, shaped through history ²¹⁵.

The Decay of Western Influence 🐦

Western people *know* that work is important, and organize their individual lives and their communities in ways which stress and reinforce the importance of the organizational forms and processes of interaction required by work. But, let's not forget that other communities are just as consistent in their thinking, just as certain of the importance of their own understandings of the world, and just as committed to maintaining them through time. And, because these structures and principles are historically, and uniquely determined within communities, it is most unlikely that they will reinforce or give coherence to the Western commitment to work.

People can, of course, be taught the Western understandings, and, while the West is dominant and they need to behave in those ways in order to succeed in that Western dominated world, they will appear to live by those understandings. However, if the influence of the West wanes, so too does the commitment of those people to ordering their lives by Western understandings. Then, they begin, inevitably and less than consciously, to reshape their own behaviors and interactions to fit the unconscious ordering principles of their own communities.

Britain, in the 5th century A.D., provides an excellent historical illustration of this.

By 400 A.D. the Romans had occupied Britain for almost four hundred years ²¹⁶ and had determinedly set about making it into a Roman Province. As ^œGildas (c.494 or 516-c.570) says, Britain

was no longer thought to be Britain, but a Roman island; and all their money, whether of copper, gold, or silver, was stamped with Caesar's image.

(Chapter 7)

Yet, on the withdrawal of the Roman legions between 400 and 410 A.D., life rapidly reverted to pre-Roman ways. As ^œCatherine Hills (1990) says,

around 400 AD Romanists see the end of most of the kinds of information which can be deployed to reconstruct life in Britain for the previous three and a half centuries. Written sources disappeared, and coins, wheel-thrown pottery and masonry building went out of use...

[E]ssentially, from a Romanist's point of view it is obvious that the institutions and way of life of Roman Britain disappeared soon after 400 AD. The absence of 'Roman' kinds of evidence means that we are dealing with a different kind of society, possibly a different kind of people.

Any region which has been subjected to enforced reorganization and commitment to externally imposed understandings of the world will experience a period of turmoil and chaos as those imposed forms become less dominant in the lives of inhabitants.

Britain, in the 5th century, experienced just such turmoil as rival 'kings' battled for ascendancy and neighboring groups, taking advantage of the chaos, invaded the region. Gildas, a century after the exodus of the Roman legions, provided a graphic (if polemically biased) description of the chaos which ensued with the waning of Roman influence in Britain,

...neither to this day are the cities of our country inhabited as before, but being forsaken and overthrown, still lie desolate; our foreign wars

having ceased, but our civil troubles still remaining.
(Chapter 26)

As the empires of Western Europe have crumbled, the institutions in their post-colonial territories, established by them to ensure continuity with the colonial past, have become decreasingly effective. The 21st century has produced its own examples of post-colonial territories suffering turmoil and chaos in the increasing numbers of 'fragile' and 'failed' states which are a growing concern for Western people ²¹⁷.

Many post-colonial territories are in various stages of change. They are slowly, but inevitably, metamorphosing into communities which exhibit similarities with the pre-colonial communities from which they came. Any reassertion of pre-colonial principles of categorization and classification will inevitably be slow and difficult. Over time, forms of organization and interaction will emerge which echo those of the past though they will, of course, not simply replicate past forms.

First, any form which emerges is simply one of a range of possible forms, any or all of which might be generated from the same fundamental categorical principles. So, even if the same principles were in operation one would find different surface forms over time.

Secondly, the principles themselves are not static, they change through time and the forms of interaction and organization which emerge will reflect such changes.

This has been demonstrated time and again in Third World communities as Western influence has become less dominant.

Of course, the longer the period during which a community has been subjected to enforced reorganization to Western understandings of reality, the greater the disruption. It is inevitable that there will be chaos and turmoil as opposing groups attempt to reorder their worlds to their own advantage.

 (28/11/16)

As people no longer order their lives by those *rational* ²¹⁸ forms of meaning and organization which the West has introduced into their communities, Western people will inevitably feel threatened. They will (and do) consider that they have a responsibility to intervene and re-impose forms of organization which they see as rational and necessary to successful integration into the global economy.

This is particularly true when non-Western people appear to lose their commitment to forms of organization and activity which maximize the possibility and quality of productive employment. Then, Western people know that if they cannot organize *themselves* to work, it is perfectly acceptable, indeed, necessary, that multi-national enterprises base their productive activities in their communities. This is one of the reasons why Western organizations have argued so strongly for economic globalization over the past thirty years.

(17/01/17) For many people in Third World countries however, globalization seems like a [new form of ruthless colonialism](#), a conspiracy of the rich against the poor and defenceless²¹⁹. As Marjorie Mbilinyi, author of *Big Slavery: The Crisis of Women's Employment and Incomes in Tanzania* (1991), claimed:

We could have a lot of despair in Africa right now. Many of us see this as a moment of mass genocide. And it's a very conscious one, we think, on the side of at least some big government actors as well as some of the actors in agencies like the World Bank and the IMF.

The peoples of Africa are being steadily impoverished. They are also being dispossessed of their lands. Governments like Tanzania, partly in response to popular demand, had begun to nationalize assets and try to guide the economy in the direction that would meet the basic needs of the people and increase national control and make it more inward oriented. Now we have complete reversal so that it is almost worse than in the colonial period.

(Mbilinyi 1994)

Fantu Cheru claimed of African experience:

The overwhelming consensus among the poor in Africa today is that development, over the past 25 years, has been an instrument of social control. For these people, development has always meant the progressive modernization of their poverty.

The absence of freedom, the sacrifice of culture, the loss of solidarity and self reliance which I personally observed and experienced in many African countries, including my own, explains why a growing number of poor Africans beg: please do not develop us!
(Cheru 1989, p. 20)

The International Consortium of Investigative Journalists (ICIJ) has summarized investigations into the World Bank's track record in 'helping' 'the poor' most affected by the consequences of its policies, programs and projects in countries around the world. See the ICIJ's^œ [Investigative Projects](#) for this and other relevant projects. Its key findings on World Bank activities:

- Over the last decade, projects funded by the World Bank have physically or economically displaced an estimated 3.4 million people, forcing them from their homes, taking their land or damaging their livelihoods.
- The World Bank has regularly failed to live up to its own policies for protecting people harmed by projects it finances.
- The World Bank and its private-sector lending arm, the International Finance Corporation, have financed governments and companies accused of human rights violations such as rape, murder and torture. In some cases the lenders have continued to bankroll these borrowers after evidence of abuses emerged.
- Ethiopian authorities diverted millions of dollars from a World Bank-supported project to fund a violent campaign of mass evictions, according to former officials who carried out the forced resettlement program.
- From 2009 to 2013, World Bank Group lenders pumped \$50 billion into projects graded the highest risk for "irreversible or unprecedented" social or environmental impacts - more than twice as much as the previous five-year span.

(ICIJ, ^œ[Evicted and Abandoned: The World Bank's Broken Promise to the Poor](#), Accessed 17 January, 2017)

One can but agree with Bill Mitchell's assessment of the true usefulness of anachronous Western institutions which have been adapted to compel nonwestern peoples and communities to conform to Western ideological understandings:

The IMF was created to provide funding support to nations under the Bretton Woods system of fixed exchange rates when their trading accounts endangered their capacity to sustain the agreed parities. After the system collapsed in August 1971 (effectively), the IMF had no further purpose. It reinvented itself as a neo-liberal attack dog on government intervention, and, as such, has no progressive (productive) role to play and should be scrapped. Similarly, the World Bank.

The OECD was created (as the Organisation for European Economic Co-operation (OEEC)) to manage the Marshall Plan funds that Canada and the US provided to reconstruct Europe at the end of World War II. It has similarly outlived its productive purpose and is now a major source of disinformation. Even in the realm of fiction, there are much better fiction writers than exist within the bowels of the OECD in Paris. (Bill Mitchell, [Poor fiction from the OECD - the organisation should be abolished](#), *Billy Blog*, November 28, 2016)

Neoliberal ideologues have proved remarkably adept at seizing anachronous Western institutions and remaking them into neoliberal attack dogs. The IMF, along with the World Bank, are the organizations they subverted to ideological ends in Third World countries, and, more recently, in the peripheral nations of the European Union.

Western people, however, *know* that those Western financial and 'development' oriented institutions are not aiding and abetting multi-national enterprises in exploiting resources and cheap labor. They are opposing socialist, dictatorial and anarchic tendencies. They are ensuring that communities are once again guided into market-led economic development. Multinationals are providing much needed capital and expertise which might help to turn those countries once more back to *economic* prosperity. Not only are they providing some cash inflow to communities, they are, even more importantly, reintroducing them to "work discipline".

Work discipline, titles of consumption and status

 (04/04/17) (26/06/17) (22/02/19) (08/10/19) (10/10/19) (24/08/20)

Over seven centuries of teaching themselves and their 'Poor' the importance of work, Western people have built a wide range of presumptions into the concept to buttress its importance. It has become important for its own sake, a form of organization and activity to which all truly moral people commit themselves.

Any suggestion that people should be freed from work to other activity without losing income would be regarded by most Western people as impractical, irresponsible, foolish or subversive. While many people might find [Bertrand Russell's vignette](#) with which this discussion started, clever, few would accept that his solution is 'practical'.

A 2019 *University of Maryland* report has summarized the process by which human beings are, slowly but surely, being herded into new forms of 'work' as artificial intelligence matures and existing 'jobs' are displaced²²⁰:

Being able to solve problems and analyze data will not be the keys to your success in the future, says marketing professor Roland Rust at the University of Maryland's Robert H. Smith School of Business. Artificial intelligence will soon have that covered. If you expect to have a viable career, you better get in touch with your emotions, he says, because the "Feeling Economy" is coming....

"It means that if humans want jobs, they better get good at feeling," Rust says. "Things like interpersonal relationships and emotional intelligence will be much more important." Even though people skills have always been important, what the researchers conclude is that the value of these skills will soon be of unprecedented importance....

"This is something that is going to hit people before they know it," says Rust. "It's already happening. We're already seeing the shift in feeling as being more important, not only in terms of employment growth, but in terms of compensation growth. There is greater compensation growth in feeling than there is in thinking. This is really across the board - you name a job and we can show a shift from thinking to feeling."...

"You certainly don't need to worry about things like multiplication tables," he says. "You can do that on a machine, and everybody's cell phone will do that for them. That kind of skill is just useless."

Rust says we better get used to the idea of AI doing more. He thinks AI will eventually even take over most of the emotional tasks of relating to people. And as AI gets more sophisticated, there's no going back, he says. "The genie is out of the bottle."

([Analysis of US labor data suggests 'reskilling' workers for a 'feeling economy'](#), University of Maryland News Release 7 October 2019)

And yet the emphasis on 'work' in the capitalist world has not diminished. People, in a globalized capitalist world, must still 'work for a living' in a world fast moving toward ['share the scraps' job markets](#).

Marshall Auerback, writing on *American Compass* (a conservative 'think tank' which 'promotes a distinctly conservative approach to economics'), has described what has happened in the 21st century:

The tech industry buzzword "gig" has distracted society from important questions about the gig economy that are surprisingly traditional: whether a business has employees or contractors, and how it can avoid payroll taxes and legal liability. Countless Silicon Valley business models have been built under the guise of gigs, Uber and Lyft two of the best-known cases, which is ironic considering that for all of their high-tech pretensions, at the core both are taxi and food delivery services. But with state governments like California facing increasing revenue shortfalls and an estimated 57 million gig workers in the United States noting a lack of employer protections and fair wages, the matter has shifted to the courts.

...In a genuinely independent contractor relationship, the quid pro quo is higher pay as an offset to the lack of paid benefits. But companies in the gig economy generally don't operate this way: Uber and Lyft pay minimum wages that in many instances compel employees to work 70-80 hours per week to make a living. That considerably impinges on the contractor's supposed work-time flexibility, as well as rendering it virtually impossible to afford decent benefits, such as adequate health insurance, let alone sick pay or vacation leave. In the words of a recent

report of the National Labor Relations Board's Office of the General Counsel (NLRB GC), "Uber drivers - who earn about \$9-\$10 an hour - can't expand revenues because they can't control prices or expand their customer base - the only thing they can do is drive more hours." In the words of a recent report of the National Labor Relations Board's Office of the General Counsel (NLRB GC), "Uber drivers - who earn about \$9-\$10 an hour - can't expand revenues because they can't control prices or expand their customer base - the only thing they can do is drive more hours."...

...While they are called "independent contractors," their independence is illusory because the so-called "entrepreneurs" in reality "do not even have basic control over how they deliver rides... [and] are 'supervised' by semi-automated and algorithmic systems that track their acceptance rates, time on trips, speed, customer ratings, and other factors, and drivers can be 'deactivated' based on these factors." That's not a co-equal work relationship between an employer and an independent contractor; it's more a form of indentured servitude facilitated by 21st century surveillance technology. (Marshall Auerback, ^œ[The Gig Economy Is Paving the Road to Serfdom](#), *American Compass*, The Commons, Aug 23, 2020)

The Computer Revolution 🖥️

 (01/05/17) (25/02/19)

This has never been better demonstrated than in the Western response to the computer revolution. During the 1960s Western people first became aware of the transforming possibilities of the computer revolution which was looming on the horizon.

A report from a specialist committee to President Lyndon Johnson of the USA in 1964 examined the issue and made a number of recommendations. They were summarized by Macbride in 1967:

Distribution of titles of consumption (i.e., money) has been via jobs... this will have to end. The continuance of the income-through-jobs link as the only major mechanism for distributing effective demand - for granting the right to consume - now acts as the main brake on the almost unlimited capacity of a cybernated productive system.

Further, up to this time resources have been distributed on the basis of contributions to production, with machines and men competing for employment on somewhat equal terms. In the developing cybernated system, potentially unlimited output can be achieved by systems of machines which will require little cooperation from human beings. (Macbride (1967, p. 195); see ^œ[AD Hoc Committee on the Triple Revolution](#) (1964) ²²¹)

Numerous articles were written in newspapers and magazines speculating on how people would *fill in their time* when robots and other computer based technologies made their lives easier and freed human beings to leisure activity. And, equally, speculation was rife as to "how to distribute the abundance that is the great potential of cybernation" when consumption was no longer tied to work.

How would we distribute income to people when machines were doing the producing and money had become simply a means to obtain goods and services produced by them, with the "income-through-jobs link" broken?

Of course, there seems no logical reason why, if we invent machines to do our work for us, we should not reward ourselves by gaining increased leisure time and by distributing the means for obtaining the goods and services produced in some other way than as rewards for work. The reality, however, has been very different from the speculated futures of those articles²²².

Daron Acemoglu and Pascual Restrepo have addressed the likely impact of the robotization of industry on the jobs and incomes of people in industrialized countries in the 21st century, with a special focus on the United States. They have summarized their findings:

As robots and other computer-assisted technologies take over tasks previously performed by labor, there is increasing concern about the future of jobs and wages. We analyze the effect of the increase in industrial robot usage between 1990 and 2007 on US local labor markets. Using a model in which robots compete against human labor in the production of different tasks, we show that robots may reduce employment and wages... [W]e estimate large and robust negative effects of robots on employment and wages across commuting zones. (Daron Acemoglu and Pascual Restrepo, ^œ[Robots and Jobs: Evidence from US Labor Markets](#), NBER Working Paper 23285, March 2017)

What is seldom addressed is the inevitable consequence of the post 1970s 'off-shoring' of labor-intensive industry. The jobs most likely to be amenable to automation are also those jobs which have, over the past fifty years, been relocated to take advantage of weak legislative protections, low (or non-existent) taxation regimes and low-cost labor in free trade zones, maquiladoras and export processing zones - wherever labor is cheap and regulation relaxed or non-existent.

The low-hanging fruit of readily automatable industry in Western regions has largely already been exploited. Many of the remaining jobs, [increasingly in service industries](#), are less susceptible to robotization (at least in the near-term).

In January 2017, James Manyika (*et al*) produced a report entitled *A Future that Works: Automation, Employment, and Productivity*. As they summarized:

We are living in a new automation age in which robots and computers can not only perform a range of routine physical work activities better and more cheaply than humans, but are also increasingly capable of accomplishing activities that include cognitive capabilities. These include making tacit judgments, sensing emotion, or even driving - activities that used to be considered too difficult to automate successfully.

The automation of activities can enable productivity growth and other benefits at both the level of individual process and businesses, as well as at the level of entire economies, where productivity acceleration is sorely needed, especially as the share of the working-age population declines in many countries. At a microeconomic level, businesses everywhere will have an opportunity to capture benefits and achieve competitive advantage from automation technologies, not just from labor cost reductions, but also from performance benefits such as increased throughput, higher quality, and decreased downtime. At a macroeconomic level, based on our scenario modeling, we estimate

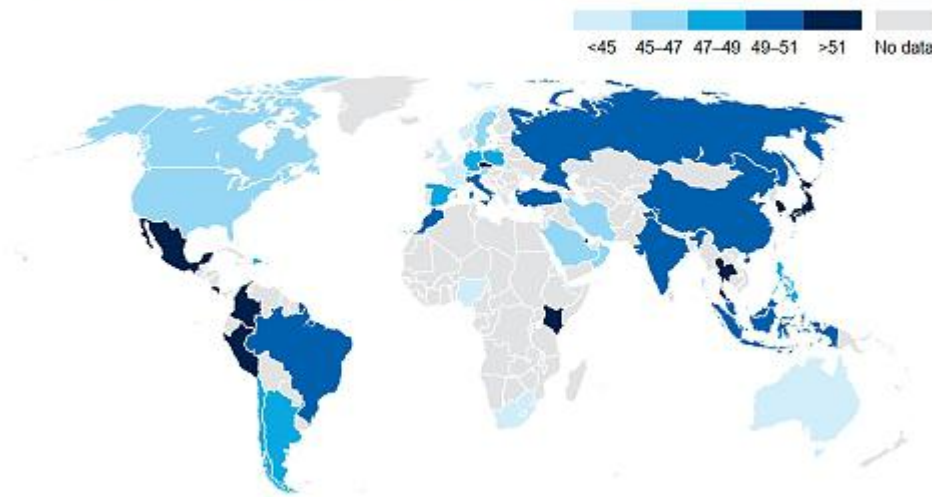

automation could raise productivity growth on a global basis by as much as 0.8 to 1.4 percent annually.

In a summary map they provide an estimate of the technical automation potential of the global economy

Exhibit E5

The technical automation potential of the global economy is significant, although there is some variation among countries

Employee weighted overall % of activities that can be automated by adapting currently demonstrated technologies

Technical automation potential is concentrated in countries with the largest populations and/or high wages
Potential impact due to automation, adapting currently demonstrated technology (46 countries)

(James Manyika, Michael Chui *et al*, *A Future that Works: Automation, Employment, and Productivity*, McKinsey Global Institute, January 2017, Pp. 4, 15)

Life Beyond 'Work': What fate awaits human beings and their societies? 🐦

📅 (04/03/23)

All this underscores the importance of challenging the increasingly myopic Western capitalist definition of human beings as a 'workforce' and 'consumer base'. It really is important to [reconstitute the Commons](#).

Kai-fu Lee has cogently explained where 21st century developments in 'artificial intelligence' are taking the capitalist world. As he asks: 'What is to be done?'.

...A.I. products that now exist are improving faster than most people realize and promise to radically transform our world, not always for the better. They are only tools, not a competing form of intelligence. But they will reshape what work means and how wealth is created, leading to unprecedented economic inequalities and even altering the global balance of power.

It is imperative that we turn our attention to these imminent challenges...

Unlike the Industrial Revolution and the computer revolution, the A.I. revolution is not taking certain jobs (artisans, personal assistants who use paper and typewriters) and replacing them with other jobs (assembly-line workers, personal assistants conversant with computers). Instead, it is poised to bring about a wide-scale decimation of jobs - mostly lower-paying jobs, but some higher-paying ones, too.

This transformation will result in enormous profits for the companies that develop A.I., as well as for the companies that adopt it...

We are thus facing two developments that do not sit easily together: enormous wealth concentrated in relatively few hands and enormous numbers of people out of work. What is to be done?

(Kai-fu Lee, ^{oe}[The Real Threat of Artificial Intelligence](#), *New York Times*, SundayReview | Opinion, June 24, 2017)

The world is facing a future of [enormous wealth concentrated in relatively few hands](#) and enormous numbers of people out of work. What is to be done?

The author's possible solutions need to be compared with the conclusion reached in that [1964 report to President Lyndon Johnson](#) of the USA:

Distribution of titles of consumption (i.e., money) has been via jobs... this will have to end. The continuance of the income-through-jobs link as the only major mechanism for distributing effective demand - for granting the right to consume - now acts as the main brake on the almost unlimited capacity of a cybernated productive system.

In a truly intelligent, empathic world, there would be no debate.

It is becoming increasingly obvious that we are witnessing an unstoppable computerized displacement of increasing numbers of 'gainfully employed' human beings. The future is likely to be either the one envisaged in that 1964 report: a world where human beings are no longer seen as capitalism's 'workforce'; or one in which human beings increasingly live in a ["share-the-scrap" economy](#); as David Graeber expressed it: a world of "bullshit jobs".

But this is not how it should all end! We are - or at least I've been led to believe that we are = an intelligent species. It is inevitable that we will find ways of minimizing the effort needed to supply the needs of life.

The challenge is how, in an industrialized, capitalist society, to ensure the livelihoods and meaningful existence of all its members. That is, how can we distribute 'titles of consumption' (i.e., money) in ways other than through 'work'? And, how can we prepare communities of human beings for life after 'work'?

[The answers are obvious](#) but have been obscured by those who have benefitted most from an outdated and injurious system of wealth distribution and human 'employment'.

Let's move on to the new reality - that the age of 'jobs' and 'work' requiring the organized use of human 'labor' is thankfully ending. We are not there yet but, with the [necessity of limiting consumption](#) in an age when automation has rapidly increased productive output, it is time for a new understanding of what life is all about.

We already have all the infrastructural means needed to [enable the distribution of income](#) and goods and services to people without requiring them to 'turn up for work'. What we are increasingly desperately needing is an alternative understanding of the [meaning and purpose of life](#).

The survival of our species depends, quite literally, on confronting and resolving this challenge.

Lant Pritchett, in an essay entitled 'People Over Robots: The Global Economy Needs Immigration Before Automation', has offered a 'solution'

which would perpetuate the present organization of capitalist societies:

We live in a technological age - or so we are told. Machines promise to transform every facet of human life: robots will staff factory floors, driverless cars will rule the road, and artificial intelligence will govern weapons systems. Politicians and analysts fret over the consequences of such advances, worrying about the damage that will be done to industries and individuals. Governments, they argue, must help manage the costs of progress. These conversations almost always treat technological change as something to be adapted to, as if it were a force of nature, barreling inexorably into the staid conventions and assumptions of modern life. The pace of change seems irrepressible; new technologies will remake societies. All people can do is figure out how best to cope.

Nowhere is this outlook more apparent than in the discussion of automation and its impact on jobs. My local grocery store in rural Utah has hung, with no apparent sense of irony, a sign proclaiming the company's support for U.S. workers above a self-checkout machine, a device that uses technology to replace the labor of an employee with the labor of the customer. Much ink has been spilled in explaining how automation threatens some low-skilled workers and what governments should do to help: for instance, countries could support retraining initiatives, revamp education systems, or invest in redistributive schemes. At the same time, many governments hope that machines can save their economies from the consequences of demographic decline and aging. Techno-optimists argue that the United States and many other wealthy countries need automation to make up for dwindling working-age populations and looming gaps in workforces. Happily, they suggest, the advance of technology will sweep aside the troubles of demography.

But these debates and arguments miss a very simple point. As seismic as it may seem, technological change is not a natural force but the work of human beings. Of course, technology has radically improved human lives: no one wants to live without electricity, flush toilets, or (in Utah) central heating. In other cases, however, it is new policies, and not new technologies, that societies need most....

(Lant Pritchett, ^œ[People Over Robots: The Global Economy Needs Immigration Before Automation](#), *Foreign Affairs*, February 28, 2023)

But, of course, that answer is no answer! It is the equivalent of [poor Hans's attempt to avoid dyke collapse](#) by sticking his finger into the developing breach.

We should embrace and harness the new technological possibilities. They should become the blessed inheritance of humanity not the means for the enslavement of most to the dubious 'benefit' of a few.

Both 'money' - titles of consumption - and human technologies are human inventions. Let's harness both to the benefit of all!

As we explore what has happened over the past century we should be constantly asking ourselves:

Is there a better way to distribute income and supply human needs than condemning humanity to endless 'work', 'poverty' and exploitation?

That is one of the most important challenges that confront us in this crisis - filled 21st century!

Globalization, Free Trade Zones and Definitions of Employment 🌐

📅 (17/07/18)

In the 21st century people either work for longer hours, with more demanding pressures, or find themselves, involuntarily, committed to casual and part-time work or to unemployment queues. And the incomes of people are, if anything, more closely tied to work than they were forty years ago. Business taxes, duties, tariffs and other forms of public impost on economic activity have been reduced to ensure the continued competitiveness of industry. And government services and welfare payments have correspondingly been cut back ²²³ - often because it has been claimed that they 'reward improvidence' ²²⁴.

Through the rest of the world over the past thirty years, the globalization of productive enterprise has resulted in the reorganization of entire populations to provide low paid labor for export goods.

For graphic illustration of this, see Michael Zhang, Apr 05, 2013, ^œ[Eye-Popping Photographs of Hong Kong High-Rise Apartment Buildings](#)

(Each window represents a family (or more))

See Bettina Wassener and Grace Tsoi, ^œ[Have-Nots Squeezed and Stacked in Hong Kong](#) (*New York Times*, September 27, 2013) for a depressing description of what happens when [hyperglobalization](#) makes workers 'redundant'. At what point does the relocation of production to regions where the costs of production are lowest; coupled with callous disregard of those disenfranchised and discarded, morph into ill-disguised slavery and crimes against humanity (the ^œ[Rome Statute of the International Criminal Court](#) defines these as: "... particularly odious offenses in that they constitute a serious attack on human dignity or grave humiliation or a degradation of human beings.")?

Raveena Aulakh provides a damning assessment of conditions in a Bangladesh factory:

A Bangladesh factory that sews garments for The Gap and Old Navy brands routinely forces workers to work over 100 hours a week and they are slapped, shoved and punched, says a damning report.

It also says workers live in penury, earning 20 to 24 cents an hour, and illegal firings are regular.

The report titled "Gap and Old Navy in Bangladesh: cheating the poorest workers in the world" was released Thursday by Pittsburgh-based Institute for Global Labour and Human Rights.

Charles Kernaghan, director of the institute, said in the report "these abuses have been going on for more than two and a half years." (Raveena Aulakh/Torstar News Service, ^œ[Bangladesh factory that sews garments for The Gap and Old Navy accused of abusing workers](#), *Cambridge Times* (Canada), Oct 04, 2013;

^œ The factory building in Rana Plaza, whose collapse in April of 2013 killed 1,129 garment workers. Credit Khaled Hasan for The New York Times

see also, this *Institute for Global Labour and Human Rights* summary: ^œ[Two Excellent Articles Expose Gap in Bangladesh](#); Stephanie Clifford and Steven Greenhouse, *New York Times*, September 1, 2013, ^œ[Fast and Flawed Inspections of Factories Abroad](#))

From the mid 1970s, transnational companies increasingly began to locate their low-wage production activities in selected Third World countries, taking advantage of new transport developments, particularly the development of container shipping which transformed Western waterfronts during the 1970s.

Those who were most directly involved in Third World development planning and programs saw this new movement to produce low-wage goods in Third World countries as providing a new base for national development in those countries. With the failure of import substitution industrialization, and the faltering of value-added industrial development ²²⁵, this new move by transnational companies to relocate in Third World countries was seen as a 'window of opportunity' for Third World people.

Where government-directed planning had not succeeded, private investment from Western countries would. Development agencies, therefore, strongly promoted various forms of deregulation to facilitate transnational investment in the Third World.

The result, for Western populations, was a transient affluence as goods made in non-Western sweat-shops flooded Western supermarkets and malls. It also [resulted in increasing unemployment](#) among low-skilled

workers. This last effect was rapidly disguised, in Western nations, by altering the definition of employment to include all people who 'did any work at all for pay or profit'. The U. S. Bureau of Labor Statistics gives the current definition of employment,

...people are considered employed if they did any work at all for pay or profit during the survey week. This includes all part-time and temporary work, as well as regular full-time, year-round employment. (USBLS 2010)

Even one hour of paid work in a week now qualifies an individual for definition as 'employed'. The definition has been completely divorced from any consideration of a 'living income'. The relation between 'employment statistics' and living standards has been broken, allowing for the disguised growth of a low paid, marginalized workforce in Western countries ²²⁶.

A EurekAlert summary of a report by Lambert, Henly and Haley-Lock (2010) entitled *Managers' Strategies for Balancing Business Requirements with Employees' Needs*, provides a glimpse into the situation in 2010,

The United States workforce, battered by an economic slowdown, now includes a record number of workers who are involuntarily working part-time due to reduced hours or the inability to find a full-time job.... Hourly workers - the majority of the wage and salary workforce - are especially susceptible to reduced, irregular and fluctuating hours, and the myriad of challenges associated with them....

The Census Bureau uses the term for those who work less than 35 hours a week because they could not find a full-time job or those who work reduced hours due to "slack demand." In November 2009, 9.2 million workers fell in this category, the highest level in recorded history.

Other recessions also have seen an increase in involuntary part-time workers, she said. For example, the labor market added 1.5 million involuntary part-time workers between 1981 and 1982 for a total of 6.8 million workers, surging up again to add 2.3 million between 1992 and 1993 for a total of 6.7 million workers.

"I think it is important to underscore that employment has become increasingly precarious over the past 30 years, not just during recessionary periods, due to structural changes in the economy, reductions in labor protections and evolving employer practices that pass risk from the market onto workers," Lambert said. "The current recession highlights these insecurities, bringing much-needed attention to the plight of disadvantaged workers who are struggling to keep their jobs as well as maintain sufficient hours to make ends meet.

The problems faced by hourly, low-level workers are unlikely to go away when the economy fully recovers."

In good times and bad, employers frequently use "just-in-time" scheduling practices - setting hourly workers' schedules with limited advance notice to accommodate fluctuating demand - as a means of maintaining a tight link between labor costs and demand.

Unpredictable schedules not only make it harder for workers to determine their incomes, they also make it hard to plan for childcare and family life, Henly said.

"Unpredictable work schedules can translate into instability in family routines and practices, placing additional burdens on already strapped

and busy families, their caregivers and extended family members," she said.

(^œ[EurekAlert 31 Aug. 2010](#) 'Hourly workforce carries burden during recession' ²²⁷)

Across the Western world, the consequences of low wage competition from Third World nations, coupled with increased emphasis on migration into Western countries from depressed regions of the world have become endemic. Work conditions for low-skilled Western workers have continued to deteriorate.

Andrew Crane *et al*, in a study entitled 'Innovations in the Business Models of Modern Slavery: The Dark Side of Business Model Innovation', describe conditions in the United Kingdom in the second decade of the 21st century. Forms of '[debt bondage](#)', [peonage and indenture](#) have evolved in this 21st century to invisibly blend into 21st century employment practices:

People trapped in modern slavery can be 'underworked' by ruthless employers, to increase their debt bondage and provide revenue from living costs.

The assumption that victims of exploitation are worked like 'slaves' is shielding extra layers of exploitation, shows research led by the University of Bath's School of Management, published by the Academy of Management.

The study of the food and construction sectors in the UK found that far from being worked as hard as they can, victims can sometimes be given no work for several weeks, or only a few hours a week.

Gangmasters take on more workers than they need and deliberately avoid giving victims work. They provide them with accommodation and money for food, on the proviso it is paid back when they start earning; cultivating dependence and debt bondage, most common among migrant workers in the agricultural sector.

Victims become 'coerced consumers', forced into spending wages on accommodation, food, transport and other goods provided by their employer. They are driven deeper into debt, securing funds from family members abroad, or instant loan services.

In other cases, workers will accumulate large amounts of debt, usually with undisclosed premium interest rates, that they cannot repay. They are pushed further into financial dependence and become increasingly susceptible to continued exploitation.

(^œ['Underworked' victims of modern slavery endure extra exploitation](#), *EurekAlert* Summary, Public Release: 16-Jul-2018)²²⁸

In Third World countries, a variety of 'free trade zones' were established as governments competed to attract transnational companies ²²⁹.

From the late 1970s, Western governments, seeking ways in which to stimulate their own faltering trade ²³⁰, lowered tariff barriers to selected Third World countries. However, the consequences have been rather different than initially anticipated by the experts ²³¹.

 (16/04/17)

So, what has gone wrong? Why have not new technologies, which have, unarguably, enabled more efficient and less labor intensive production, enriched human beings everywhere and freed them to non-work activity? In order to understand why, in a climate which should have led to shorter

working hours and increasing material prosperity, people have found themselves working harder and for longer, amongst other things ²³², we need to understand the peculiar nature of *work* in Western communities.

Distinction between Labor and work 📌

Through the past seven centuries Western people have evolved a very distinctive and peculiar understanding of the nature of work ²³³, which necessitates making a clear distinction between the terms *labor* and *work*.

The term *labor*, for our purposes, will refer to any activity which includes expenditure of physical or mental effort especially when difficult or compulsory. It is normally defined as human activity that provides goods or services.

Work, on the other hand, cannot be so simply defined since it not only includes labor but a variety of moral presumptions about the nature of labor.

The following discussion of work, for reasons which we have already spelt out, relates only to understandings in Western communities. Nothing we are talking of can simply be translated to "human beings" at large. They are culturally specific understandings which reflect the peculiar history of Western communities over the past several centuries.

The term *work*, as we will define it, includes the services performed by workers for an *income* since one of the important reasons given by people who are asked why they work is that without work they would not be "able to afford to live". As Macbride (1967 p.195) put it, "Distribution of titles of consumption (i.e., money) has been via jobs" ²³⁴.

But it does not only refer to activity which generates an income. It is also, and perhaps far more importantly, the term we use to imply that an object is performing as *it was meant to perform* ²³⁵. So, we are able to ask "is it working?", and the person to whom we are speaking knows that in order to answer the question he or she must check its *performance* and that performance should be judged against the *potential* of the item.

There is a teleological dimension to the term. 'Work' is understood, in a less than conscious way amongst most Western people, to be directed toward an end or shaped by a purpose, primarily related to individuals *achieving their potential*. People *ought* to work.

This understanding of the meaning of work implies that objects, or people, have been designed to perform in certain ways. When they are performing as they have been designed to, they are *working*. When they are doing something other than what they have been designed to do, they are *not working* or they are *disabled*.

The Able-bodied and the Disabled - The Deserving Poor 📌

During the 17th to 19th centuries in Western Europe, there emerged a clear division between the "deserving" and the "undeserving" poor. Those who were undeserving were those who, while "able-bodied", yet were not employed and/or relied on welfare support to one extent or another for subsistence. The deserving poor were those who could not help being unemployed. The largest category of these were people who were classified as in some way "disabled" as a consequence of some physical imperfection or other which interfered with their ability to be employed.

During the 17th and 18th centuries, as Mackelprang and Salsgiver (1996) explained, it was assumed that it was the responsibility of the community to repair these imperfections so as to ensure that such people could engage in work.

In the United States, institutions dedicated to perfecting the imperfect sprang up (Rothman, 1971) with the hope that professional intervention could cure these inadequacies. When a cure was not possible, people with disabilities could at least be trained to become functional enough to "perform socially or vocationally in an acceptable manner" (Longmore, 1987b, p. 355).

Over the past two centuries, Western communities have identified a variety of "disabled" people. Into this residual category are placed any who are, in any way, "deficient". The range of people placed into this category is remarkably wide, including those who are mentally retarded or otherwise mentally 'impaired', blind, deaf, lame, exhibiting some other form of physical abnormality or 'deformity', or suffering from any of a variety of long-term illnesses.

Even today, the term "disabled" is applied to any who are in any way "impaired" and are therefore "dependent". This is exemplified in the acts passed in most Western countries over the past fifty years, such as the *Americans with Disabilities Act* (1992) which guaranteed to the physically or mentally impaired protection against discrimination (see Anderson 1992). This category includes not only those with physical or mental problems, but also many whose "impairment" is social in nature.

But for the need to be able to perform at "work" and so ensure their "independence" ²³⁶, there could be little reason for the existence of such a widely inclusive category of people. These are the "dependent" ones, those who must be "cared for".

During the 19th century Western communities developed quite specific programs for dealing with these "unrepairable" people. Such people were concluded to be permanent "dependents" who should be cared for by the community but were, nonetheless, a drain on its resources. It was believed that they should, to a large extent, be separated from the rest of the community lest others become in some way contaminated.

Professionals lost confidence in their ability to perfect people with disabilities, concluding that they were innately unproductive and thus endemically without worth. No intervention could bring about change because the laws of nature deemed people with disabilities unfit (Longmore, 1987a).

People with disabilities were to be prevented from marrying or having children for fear of propagating their imperfections.

As the 19th century progressed, institutions to deal with the threat and nuisance of people with disabilities increased dramatically, and they were increasingly isolated and institutionalized, sometimes in sub-human conditions. (Mackelprang and Salsgiver (1996))

Work and its antonyms 🦋

For those who are not "handicapped" or "disabled", there are two contrasting states to *work* in Western communities. The first is usually termed *unemployment*, this is, as most dictionaries define the term, "a period of *involuntary idleness*". It is during periods of *un* employment that people are paid "the dole". Synonyms of the term include: alms, charity, gratuity, handout, mite, pittance, trifle. Being unemployed is assumed to be related to misfortune and heartache, to living from hand-to-mouth.

The unemployed person is being denied the *opportunity to work*, and there is something morally wrong with a person who accepts this situation with equanimity. People who are not given the chance to work *should* feel a sense of adversity, of affliction, of being judged as good-for-nothing and worthless. Those who lose their jobs are said to have been *declared redundant*.

Work and leisure 🦋

📅 (04/08/19) (11/08/19) (26/11/19)

While Western people assume the right to 'leisure time', this is not a right which even in the 21st century is universally recognized or honored. The 'forty hour week' was something which Western working people gained only after prolonged, organized protest. It was only in the 1930s that legal acceptance of the principle of a forty hour week was finally won in Western nations. It never has been in most Third World nations. Paid annual leave was also first included in Western industrial awards during the 1930s (though usually only one week).

It was during the boom years following the Second World War that both the forty hour week and annual leave became accepted as basic entitlements in Western industrial labor awards. The effective period during which 'leisure' has been available to the bulk of Western working people has been less than sixty years.

During the discussion on 'leisure' which follows we need to realize how long it took to have such time recognized as legitimate and for how short a time it has been a 'basic entitlement' for Western workers.

While most Western people over the past fifty years have assumed the right to limited working hours and paid annual leave, the entitlements have always been questioned by employers and are by no means ensured into the future. Since the 1970s, low paid workers have found their entitlements slowly whittled away. Many need to juggle more than one job in order to 'make ends meet'. ²³⁷

Worker benefits, hard-won through the [New Deal's reinvigoration of labors' rights](#) of workplace organization in the United States, have been seriously eroded in the post-1970s period. What started out as a move of low-skilled labor from Western to Third World nations, has grown into concerted campaigns to strip worker entitlements and benefits from US employees in order to ensure employers a '[level playing field](#)' in a globalizing capitalist world.

Steven Greenhouse has described the 2019 consequences:

The United States is the only advanced industrial nation that doesn't have national laws guaranteeing paid maternity leave. It is also the

only advanced economy that doesn't guarantee workers any vacation, paid or unpaid, and the only highly developed country (other than South Korea) that doesn't guarantee paid sick days. In contrast, the European Union's 28 nations guarantee workers at least four weeks' paid vacation.

Among the three dozen industrial countries in the Organization for Economic Cooperation and Development, the United States has the lowest minimum wage as a percentage of the median wage - just 34 percent of the typical wage, compared with 62 percent in France and 54 percent in Britain. It also has the second-highest percentage of low-wage workers among that group, exceeded only by Latvia.

All this means the United States suffers from what I call "anti-worker exceptionalism."

... Labor unions are weaker in the United States than in other industrial nations. Just one in 16 private-sector American workers is in a union, largely because corporations are so adept and aggressive at beating back unionization. In no other industrial nation do corporations fight so hard to keep out unions.

The consequences are enormous, not only for wages and income inequality, but also for our politics and policymaking and for the many Americans who are mistreated at work.

(Steven Greenhouse, ^{oe}[Yes, America Is Rigged Against Workers](#): No other industrial country treats its working class so badly. And there's one big reason for that, *New York Times*, August 3, 2019)

In 2019, the [assault on both US and other Western workers](#) has intensified as the lower 60% of workers: the [precariously employed, 'gig' and other 'contract' populations](#), struggle to keep their heads above water. Bama Athreya has neatly summarized the direction in which worker exploitation has gone over several decades:

...[W]e're seeing major global policy institutions divert attention from the corporate-led globalization that's eroded working conditions everywhere. Instead, they're suggesting that somehow it's the robots' fault. Technology is a problem for labor rights - but not in the way many people think. The debate over robots taking our jobs is divorced from the reality of extreme capital concentration in the digital economy - which is far more responsible for eroding workers' rights.

Capital concentration globally has vastly exceeded the levels we were protesting in the late 1990s. A select few tech companies dominate the entire globe, and their CEOs are among the richest men the world has ever known. Many of their enterprises are virtual, allowing them to elude responsibility for everything from taxes to workplace conditions.

Companies like Uber and Amazon's Mechanical Turk claim that they are neither employers nor service providers but merely intermediaries, matching clients who desire services with contractors to provide said service. But the platforms these companies run use algorithms to fragment work and pit workers against one another in new ways, forcing them to bargain against one another for gigs in a new, digitally-enhanced race to the bottom. From pedicab drivers in Cambodia to domestic workers in Tanzania, people around the world are learning that the only means to another gig is through an app. Even editing and design work are being offshored, and then 'optimized,' through unaccountable digital brokers like Rev and Upwork.

Journalist Steven Hill revealed the extent of this problem in *Raw Deal*, his expose on the industry. "In the name of hyper (market) efficiency, suddenly the 'extraneous' parts of a worker's day are being eliminated," Hill wrote. "Micro-gigs with job brokerages like TaskRabbit and Elance-Upwork are reducing workers' value to only those exact minutes someone is raking the leaves, or on the computer, or banging the nails or mopping the floor, or engaged in a specific task, toiling away and producing."

The digital economy also enables platform companies and their clients to amass incredible amounts of individual data about their workers. This can be used for "algorithmic management" - a euphemism for the use of artificial intelligence for data collection and continuous surveillance of workers. Algorithmic management, as a recent report from Data & Society notes, enables platforms to control ever more fragmented bits of a worker's time, agency and labor. Companies can use behavioral "nudges" to incentivize workers to work harder, faster, or provide labor on demand at all hours.

Penalties are also part of the machine learning. Workers that choose not to accept certain jobs for on-demand delivery, domestic or ride-hailing services can be penalized by being put in "time out" or even "deactivated," or banned from the platform, the Data & Society report finds. This fear of deactivation can coerce workers to accept undesirable gigs and hours.

And then there are the out and out ways in which platforms incentivize clients and workers to break labor laws....

(Bama Athreya, [Twenty Years After Seattle, Is There a New Race to the Bottom?](#), *Inequality*, November 25, 2019)

As Nicholas Kristof has belatedly recognized,

...The relentless assault on labor has gained ground partly because, over the last half-century, many Americans - me included - became too disdainful of unions. It was common to scorn union leaders as corrupt Luddites who used ridiculous work rules to block modernization and undermine America's economic competitiveness....

...[I]t's now clear that the collapse of unions - the share of employees belonging to unions has plunged to 10 percent in 2018 from 35 percent in the mid-1950s - has been accompanied by a rise of unchecked corporate power, a surge in income inequality and a decline in the well-being of working Americans.

[For all their shortcomings, unions midwived the birth of the middle class](#) in the United States. The period of greatest union strength from the late 1940s through the 1950s was the time when economic growth was particularly robust and broadly shared. Most studies find that at least one-fifth of the rise in income inequality in the United States is attributable to the decline of labor unions.

Unions were also a formidable political force, and it's perhaps not a surprise that their enfeebling has been accompanied by a rise in far-right policies that subsidize the wealthy, punish the working poor and exacerbate the income gap.

(Nicholas Kristof, [Trump Finds a Brawler for His War on Workers](#): America's working class is in desperate shape, and its longtime protectors - unions - have lost much of their power, *New York Times*, Opinion, August 10, 2019)

In Third World countries, with labor organization weak or non-existent, it is not uncommon for workers to be employed for six days a week and ten hours a day. This, of course, leaves very little time for 'leisure activities'.

There is, however, where leisure is accepted as a legitimate entitlement of workers, a state in which the person is *not working* both legitimately and necessarily. This is a state of *voluntary idleness*. The overarching, positive antonym for work is *leisure*, which can be divided into active and passive categories of behavior.

The active forms of leisure include pastimes, sports, games, recreation and other *amusements*. These are times when the person "charges the batteries", engaging in refreshing diversions so that they will be mentally and physically re-tuned to better perform in the realm of work. The passive forms of leisure include: relaxation, repose, rest, requiescence. These periods should provide the person with stillness, with a tranquility not possible in the busy round of work activities.

These times also have a *purpose*. They are times when the individual is able to distance himself or herself from the busy round and take stock, getting work into perspective so that they will perform more effectively and efficiently than before ²³⁸.

When people are found to be run-down, worn-out or exhausted by the pressing urgencies of work they can be prescribed times of leisure, when they can, for a period, escape the *duties of life* and become mentally and physically renovated. Even these times are considered to be intimately intertwined with work. They are not separate, alternative bases for life, they are the activities and times when human beings, who are *naturally and morally* fashioned for work, re-create themselves, and, in doing so, function more effectively within the world of work.

This conceptualization of *work* as "appropriate performance" is not closely tied to particular vocations or aptitudes ²³⁹. It is, rather, in human beings, considered to be diligent application to productive endeavor ²⁴⁰. It is very often dissociated from an individual's own aptitudes and abilities unless these have clearly been honed so as to improve the person's potential for work.

There is almost a sense of illegitimacy about "working" at something which one enjoys for itself - enjoyment, after all, is one of the definitional properties of *leisure*. If one was to respond to the question, "what would you do if you didn't have to work?" with the reply "what I am now doing" most Western people would find it difficult to accept. There seems to be a contradiction inherent in doing what one calls *work* in a time when one no longer is required to work.

So, for instance, an artist who paints because he or she greatly enjoys the activity, or a tennis player who makes a living from the game, seem in some way to be "cheating". Such people have blurred the boundaries between work and leisure. In order to ensure that this does not provide people with escape from the normal necessity to work they must be categorized as in some way "special". And, in order to remain legitimate they need to be seen as in some way "driven" to apply themselves to their activity by some inner compulsion. Work is about discipline, about applying oneself to activity which is in some way an imposition of ordered *endeavor* upon the individual.

Those who are not inwardly driven soon find that people around them supply much of the needed resolve to engage in work through their expressed attitudes toward these deviant people. It is the lucky few who are able to combine personal interest with work but they, driven to constant involvement in a form of activity which is normally defined as *leisure*, need to demonstrate that they have an extraordinary commitment to the attainment of perfection. They are *professionals* not "amateurs".

The realm of leisure is constantly being redefined as more and more leisure activities are *professionalized*, transforming them from leisure to work, from a form of activity presumed to be "relaxing" to one which the individual is diligently focused upon and from which the individual "derives an income". We speak of this phenomenon as the professionalization of sport, leisure etc..

The organization of work 🐼

Although one would hardly perform work if there were no income attached to it, there is more to work than the income obtained. Work should be performed over extensive periods of time, and the time set aside for it should be spent in activities which are clearly defined as "work related". Talking with someone involved in a large corporation, I was told the following story:

Several people in an office had found that, by hurrying through their tasks, they were able to perform most of the day's required activities in the first three to four hours of the day. They therefore decided to do this and spent much of the afternoon in playing cards.

The manager of their section of the corporation decided that this was entirely unacceptable (for reasons which you, if you are a Western person, will already understand, even if you can't articulate them). He called the offending workers into his office to remonstrate with them.

They asked him whether there was any expressed dissatisfaction with the quality or consistency of their efforts. He answered that there wasn't but that there was a perception that they were lazy because they spent so much time in playing cards. He explained that they were not employed to play cards, but to carry out the duties of their positions.

They were asked, in future, to "space" their work and spread it over the entire day. They were not to indulge in card playing or in excessive periods of "morning tea" or "afternoon tea" but were to use their time in "work related" activity.

This is, of course, reminiscent of Parkinson's (1957) Law:

Work expands to fill the time available for its completion and subordinates multiply at a fixed rate, regardless of the amount of work produced.

...A lack of real activity does not, of necessity, result in leisure. A lack of occupation is not necessarily revealed by a manifest idleness. The thing to be done swells in importance and complexity in a direct ratio with the time to be spent.

(^œParkinson 1957)

A Western person, hearing this story, immediately recognizes a whole constellation of reasons why the workers could not be allowed to continue to "play" during "work hours". Work, in almost all forms of employment, covers a period, and tasks are performed through that period. There are, in all jobs not directly driven by assembly line practices or by "piece" work, times of disguised "inactivity" through the period. Most workers, if they concentrated their efforts, could perform the required tasks of their positions in much less than the *time span* of work.

It was this recognition which led to "^œTaylorism" (see Taylor 1911), the scientific management programs of the early 20th century, which aimed to eliminate "inefficiencies" and ensure that workers performed in the most productive manner possible. It has, similarly, resulted in recent management strategies to "streamline" companies, through concentrating work activity within a smaller workforce ²⁴¹.

As we observed earlier, these practices are aimed, at a time when new technologies are simplifying work tasks and increasing productivity in many areas, at increasing the work commitment of individuals, requiring them both to work harder and for longer hours. For reasons with which most Western people find it hard to disagree, new management strategies are aimed at *increasing* commitment to work, not at lessening it. And, we know that this is as it *ought* to be. As soon as we find that a term has a teleological dimension of this kind, we immediately also know that the term is a *prescriptive* one. The term *work* is such a term in the English language.

It is undeniable that *labor* is something in which all people everywhere engage because some of the tasks which need to be performed in any community require an expenditure of physical or mental effort which is at times irksome to those required to perform the tasks. However, the need to allot a specific period of each day to the performance of such tasks, and then to ensure that people are managed in such a way as to maximize their activity, is a distinctively Western need.

It is this allotment of set times to maximized labor-related activity which uniquely defines *work* in Western communities. This complements the equally unique relationship perceived between production, possessions and status in Western communities²⁴² and ensures that people are focused on the status maintenance and attainment prerequisites of their communities.

Because our drive to consumption and accumulation is open-ended, Western people argue that so too must our commitment be to producing the goods and services we "need"²⁴³. This is a *consequence* of the Western belief that individuals should diligently apply themselves to productive endeavor, to work, rather than a *cause* of it.

It is not that we work because our needs are constantly expanding. Rather, the ability to acquire a constantly expanding range and quality of goods and services *is evidence of our strong commitment to work*²⁴⁴.

Of course, in the minds of most Western people the two are intimately connected. Since our prime means of obtaining the income necessary to obtaining the goods and services we need is work, we are quite sure that unless we work we will not be able to obtain those goods and services. This, of course, is true, but simply demonstrates how strongly Western people, over the past four centuries, have reinforced the need to work through closely tying both material wellbeing and status attainment and maintenance to its performance.

The most important forms of behavior, organization and meaning in any community are strongly reinforced through the ways in which they are made "necessary" through tying individual and communal wellbeing to them. So people sense that unless they are maintained, life will become increasingly difficult.

Over a period of more than four centuries Western European communities increasingly buttressed "work" in this way. Now, in the early 21st century, Western people are, indeed, very certain that unless they commit themselves to work, both their own wellbeing and the wellbeing of the communities in which they live will be at risk.

In a very real sense, Western people do not work in order to live, they live to work!

Teaching Western Europeans to work 🦋

So, how did it happen that Western Europeans became so convinced of the central importance of work? To understand this, we need to look back into Western Europe's historical experiences ²⁴⁵. Here we will focus on a few of the presumptions and practices which led to the present Western commitment to work.

In the past, during the 16th to 19th centuries, as Foucault says,

If it is true that labor is not inscribed among the laws of nature, it is enveloped in the order of the fallen world. This is why idleness is rebellion - the worst form of all ... the sin of idleness is the supreme pride of man once he has fallen, the absurd pride of poverty...

In the Middle Ages, the great sin... was pride... All the 17th century texts, on the contrary, announced the infernal triumph of Sloth: it was sloth that led the round of vices and swept them on.
(Foucault 1971: 56-7)

As Foucault says, by the 17th century, responsible Western people ²⁴⁶ had come to believe that commitment to work was either based on natural law requirements, or that it was necessary to sanctification.

The emphasis, among the responsible people of 17th to 19th century Western Europe, was on the *necessity* to engage in work, that is, in productive enterprise; in realizing the *potential* of one's own capacity to labor; of one's own innate "talents"; and of the environment available for exploitation.

John Locke, in the late 17th century, put it like this,

God gave the world to men in common; but... it cannot be supposed he meant it should always remain common and uncultivated. He gave it to the use of the industrious and rational (and *labor* was to be *his title* to it).
(1982 (1690), p.21).

It was the necessity to "make the most of oneself through industrious endeavor" that lay at the root of the 18th and 19th century insistence that everyone become involved in productive endeavor.

As Locke (1982, Ch. 5) argued in 1690, God commanded human beings to labor, and the property they accumulated as a consequence of their labor *demonstrated their commitment to that industriousness* which God required. To do otherwise than industriously accumulate personal property was to rebel against the natural order established by God for the wellbeing of both individuals and communities. Not only was one rebelling against God, by breaking the natural laws for human "progress" the person was also refusing to take his or her communal responsibilities seriously.

The term *work* summarized and expressed, in human organization and behavior, the central presumptions of the emerging *primary ideology* of Western Europe ²⁴⁷. Commitment to work demonstrated that the person, as an individual, was dedicated to obtaining the returns which the industrious gained for their dedicated effort. Those returns were important both to the individual and to the community in which he lived. Richard Baxter affirmed this when he proclaimed in 1678,

If God show you a way in which you may lawfully get more than in another way (without wrong to your soul or to any other), if you refuse

this and choose the less gainful way, you cross one of the ends of your Calling, and you refuse to be God's steward.
(1838, p. 377)

As Foucault (1971:46) claimed, during the 17th to 19th centuries there was far greater concern about the consequences of *idleness* than of *illness*. It was considered the responsibility of both Governments and responsible citizens to *teach* the "idle poor" the virtues of consistent work. As Sir William Coventry, in the 1670s, claimed, poor laws ²⁴⁸, which protected the idle from the consequences of their sloth, should be repealed and the Government should establish workhouses ²⁴⁹

... where such as will not work for themselves may be compelled to work for others
(in Appleby 1978, p. 151).

Sayings emphasizing the sinfulness of sloth proliferated through Western Europe, summed up in a number of very similar English proverbs: "Idleness is the beginning of all sin"; "The devil makes work for idle hands"; "Idleness breeds vice"; "Idleness is the devil's workshop". If sloth was sin, indigence and pauperism were its consequences.

By the 18th century it was well understood that indigence was closely tied to immorality. The harshness of the workhouses between the 17th and 20th centuries was necessary to discourage the moral depravity of sloth. And, just as the evils of idleness were denounced, so the virtues of *industry* were heralded. There was virtue in *steady or habitual effort*, in *diligence in an employment*, in applying oneself in a disciplined way to productive endeavor, in

adopting those habits of industry, which always tend to steadiness and sobriety of conduct, and to consequent material wealth and prosperity
(Codere 1951, p. 24).

The morality of work

There was a *morality* in the consistent, daily commitment of the individual to work, to industriousness ²⁵⁰. The individual gained respect and status through clearly demonstrating a consistent, continual commitment to harnessing his or her environment in the interests of accumulation and production. A *conspicuous* commitment to *industry* became the primary evidence of the individual's commitment to upholding the central moral values of Western Europe.

In any community, the morality of individuals is measured in terms of consistent commitment to the central tenets and understandings which drive and give force to systems of status and respect in the community. In Western Europe it became an accepted fact that "responsible people" work hard, and that, as Locke (1982, p. 27) said, "*Labor makes the far greatest part of the value of things* " ²⁵¹.

So, it was entirely necessary that individuals who worked hard should retain possession of the things whose value they had thus increased and this "necessarily introduces *private possessions* " (Locke 1982, p. 22). Hard work gives value to objects, and the evidence of hard work is, therefore, an accumulation of private property. In order to demonstrate the virtues of individuals it was necessary that those who created value should possess the objects within which that value was expressed.

The accumulation of private property *by individuals* was both just and appropriate since, through their own industry, they had created the property they accumulated. It was neither appropriate nor just that those who created the wealth should be required to share it with others who did not create wealth. Rather, those who did not create wealth for themselves should be compelled to do so. Otherwise they would be a drain on those who through their own productive endeavor had accumulated wealth and had, in this way, demonstrated their commitment to the central moral values of their communities.

Responsible governments ensured that the conditions encouraging and facilitating such activity were maintained, and that those who were "not responsible" were "made responsible" by making the condition of their lives as difficult as possible until they committed themselves to work. This has remained, throughout the 20th and on into the 21st century, a prime responsibility of Government. Governments should educate and train the "workforce", and should provide every inducement and encouragement to people to "work". They should, conversely, strongly discourage idleness and vagrancy ²⁵².

For the past several centuries Western European communities have had (and most still have) strongly enforced laws calculated to ensure that people were "gainfully employed" and had "visible means of support". Anything which might discourage people from strong and continuous commitment to work should be removed in the interests of ensuring that people "worked for their living". Over the past four centuries concerted efforts have been made by responsible Western Europeans to strip people of any other means of subsistence than work aimed at increasing the cash worth and extent of their private property.

From indolent subsistence to Labor-pool worker 🐦

Teaching 'The Poor' to Work

As a legacy of the feudal period in Western Europe, many poor peasants between the 16th and 19th centuries owned small parcels of land which provided all or part of their subsistence. They also had rights of use in areas of common land attached to manorial estates but available to all associated with the estate, whether small farmers or rural laborers, where they could forage and graze animals. The land was used for subsistence, not for increasing cash income or private property.

This focus in life was one which emphasized *communally determined limitations on the accumulation of property*, not an open ended accumulation of private property ²⁵³. As such, in the minds of the responsible people of Western Europe, the land these people held was being used "inappropriately". Therefore, as Locke (1690 Ch. 5) reasoned, it should be forfeited to those who would use it "productively", that is, to increase cash income and private property.

Not only were these peasants using the lands they controlled inappropriately, because they obtained a part of their subsistence from it, wage labor, for many of them, was an additional source of income used to augment the subsistence obtained from their own or common land. The Poor were not strongly oriented to the emerging status systems based on accumulation and conspicuous consumption which were driving activity among those who had come to be called the "middle class". In

consequence, the "laboring poor" were unreliable workers. They seemed ready to work for only so long as was necessary to obtain the additional income required for a subsistence lifestyle. If they did not need the money, they saw little reason to work ²⁵⁴.

By the end of the 17th century it was already recognized by those who were gaining control in Western Europe that so long as the poor had access to land and could supply part of their own subsistence requirements independently of the emerging work oriented economy, they would continue to treat work in this way. The answer, of course, was to strip away the small parcels of land from the poor, and to take away their access to common land, making them entirely dependent on work in the cash economy for their subsistence. The reasons given for the expropriation of these lands were varied, including, of course, Locke's argument that land-holding should be rationalized to increase its economic productivity.

The upshot was that in England, between 1700 and 1845, more than seven million acres of common land was expropriated and consolidated in the hands of larger landowners who put the greater part of it into pasturage. Considerably more land was transferred from small to large landowners through the termination of leaseholds and through challenging ownership rights where small-holders lacked documentation supporting their ownership, though no records are available to determine the amount of land transferred in this way.

Those who lost their lands in this consolidation became wholly dependent on cash work and increasingly reliant on the social welfare provided by parishes under the Poor Laws. They became a 'labor-pool', dependent for their livelihoods on employment within the mines, factories and sweat-shops of Western Europe; in competition with each other for scarce jobs ²⁵⁵.

In the 19th and 20th centuries the responsible people of Western Europe found themselves with a new responsibility. They had long accepted their responsibility for re-organizing and re-educating the poor of Western Europe. Now they had to accept the same responsibility for 'the natives' of their colonies.

Teaching 'The Natives' to Work 🐼

Responsible Western people were well aware of the problems they had encountered in educating the poor in Western Europe over more than four centuries. They realized that one of the major mistakes made had been to engage in land reform without taking into account the movement of people from the countryside. Having nowhere to go, they had 'clogged the highways and byways' during the 16th and 17th centuries and become a major problem in the cities of the 18th and 19th centuries.

They determined not to make the same mistake in their colonies. The colonial authorities would divide the land into regions, setting aside some of the less agriculturally productive areas as 'native reserves' onto which the surplus native population could be moved. They would become a labor-pool of workers, managed by the colonial administration, and employed by various economic enterprises in the colony.

Western Europeans had learned over more than four centuries that human beings were independent individuals not communal beings ²⁵⁶. As the British Prime Minister Margaret Thatcher, talking to *Women's Own* magazine, October 31 1987, explained,

...there is no such thing as society. There are individual men and women.

So, no account needed to be taken of existing indigenous forms of social organization or understandings of their environments. In colony after colony, they employed the same strategy:

- ★ Assess the economic potential of the territory;
- ★ determine where lower or higher concentrations of population were needed;
- ★ pass the necessary laws and regulations to legitimize the reorganization;
- ★ and move the native populations accordingly.

This freed up agriculturally valuable land for large scale farming and created labor pools for mining, plantation, large-scale agricultural enterprise and other economic activity. Colonial administrations also closely controlled movement of native populations out of their reserves. They would be allowed to move to administrative centers only by invitation and would return to their reserves afterwards. They would be selected for employment on the reserve and returned there when the employment was terminated.

The breakdown in law and order and in living standards among indigenous populations resulting from the complete disruption of their communities and individual lives were evidence, if any were needed, of the childlike inability of the natives to care for themselves ²⁵⁷.

Gilbert Murray (1900), a late 19th century student of British colonial labor practices, provided a clear summary of the systems of labor exploitation found in British colonies. It has been included in the following footnote ²⁵⁸.

He goes on to provide graphic examples of the ways in which 'useful' and 'useless' 'natives' were treated in various Western European colonies (see footnote ²⁵⁹).

In the 19th century, during Western Europe's expansion into the rest of the world, the emphasis on the importance of work was as strong, if not stronger than in the 17th and 18th centuries. Western Europeans took their commitment to work with them as they invaded the rest of the world.

A common theme of those who wrote on the problems in countries and communities for which they felt they had to take responsibility was that "traditional" people seemed so unwilling to put in a "full day's work".

Cairns explained their attitude,

The intrinsic value of work was revealed by Bishop Smythies (U. M. C. A. [Universities' Mission to Central Africa]) when he noted Africans east of Lake Nyasa clearing ground and cultivating 'on the steepest, most stoney slopes' of a mountain side.

This seems to point to one good thing which may come from the evil of African wars [²⁶⁰]. If all was quiet and there was no fear of... marauding tribes and yet no civilization to quicken thought, in a climate where everything comes easily to hand so readily if there are only rivers as there are here, the people would have nothing to keep them from becoming more and more enervated.

(1965, p. 79)

Henry Drummond, commenting on the people of the same area, claimed that "apart from eating, their sole occupation is to talk, and this they do unceasingly" (Cairns 1965: 79). As Cairns claims of European attitudes,

the general attitude was that work, more for the sake of the virtues which it fosters than for the wealth it created, was necessary to a well-ordered purposeful life
(1965, p. 79).

Western Europeans, intent on colonial expansion, believed that they were on a "civilizing" mission and that one of their most important responsibilities was to teach people in other countries and communities to *work*. Sir Rudolph Slatin's remedy for the people of The Sudan, described by Gilbert Murray, was an example of a common theme,

'The nigger is a lazy beast,' said Slatin, 'and must be compelled to work - compelled by Government.' 'How?' asked his interlocutor. 'With a stick,' was Slatin's reply.
(Gilbert Murray ^œ1900 p. 135)

Bernard Magubane provided a succinct description of Western attitudes toward non-Western communities in his description of relations between Europeans and Africans in South Africa,

Before they were physically subdued, African traditional societies with plenty of land confronted the requirements of capitalism with difficult problems. The wants of an African living within his subsistence agriculture, cultivating his own *mealies* (corn), were confined to a *kaross* (skin cloak) and some pieces of home-made cotton cloth. The prospects of leaving his family to work in a mine, in order to earn wages with which he could buy things he had no use for, did not at once appeal to him.

James Bryce observed that,

The white men, anxious to get to work on the goldreefs, are annoyed at what they call the stupidity and laziness of the native, and usually clamour for legislation to compel the native to come to work, adding, of course, that regular labor would be the best thing in the world for natives.

(Magubane 1975, p. 233)

This belief in the virtue of work was, by the 19th century, so ingrained in Western Europeans that they *knew* that it was both logical and rational that people be compelled to work, no matter what their objections. Western Europeans had a moral duty to teach the world to work, and they have gone about it in non-Western communities with a missionary zeal.

Over the past forty years, with the resurgence of deregulated capitalism, the reorganization of non-Western regions and communities to serve the demands of capitalism has continued apace. In free trade zones, maquiladoras and export processing zones, wherever labor is cheap and regulation relaxed or non-existent, people will work in substandard conditions, receive low wages, and live in slums.

And, all the while, Western peoples and those who emulate their lifestyles in non-Western countries and communities will continue to expand their consumption and accumulation of the products of that exploitation.

Conclusion

So long as commitment to work, and its inevitable companions - ever-expanding consumption and accumulation - are among the central primary ideological presumptions of Western communities, unregulated capitalism will continue to produce conditions like these around the world.

The emphasis upon the importance of work in Western communities has not diminished in the 20th and 21st centuries. Writers as diverse as Thorstein Veblen, John Dewey, Hannah Arendt and Daniel Bell have argued that work is a moral imperative and has, as Bell put it, "always stood at the center of moral consciousness" (in Wolfe 1997 p. 559) ²⁶¹.

The most important duties and responsibilities of community members, those which, as Kant ((1785) 1909) suggested, secure our own "freedom", are strongly reinforced through the ways in which they are made "necessary" to both individual and communal wellbeing. In Western communities, a wide range of common-sense reasons is given as to why people must be involved in work:

- ★ The economic wellbeing of the country *requires* that everyone commit themselves to consistent hard-work - only in this way will the gross national product continue to grow and the economy "expand". Bureaus of Statistics publish tables showing "days lost" due to a lack of commitment to work, to absenteeism ²⁶².
- ★ People who don't put work first fail to establish themselves financially and so become a drain on the community through becoming, at one time or another in their lives, dependent on "welfare". Consequently, their children become "disadvantaged" and in later life are unable to "achieve their potential" in the world of work.
- ★ Those who diligently apply themselves to work become "successful" and grow in self-confidence. They earn respect from others and become recognized as dependable and reliable (or, alternatively, as ruthless and dominant). In consequence they become leaders, those who will be able to take up responsibilities and see them through ²⁶³.

These understandings permeate Western consciousness. They are presented and reinforced in many different ways. Perhaps the most pervasive and effective ways in which they are reinforced are through the varieties of forms of product and service promotion and in the various forms of "entertainment" to which the vast majority of Western people subject themselves for three or four hours a day.

Whether in salacious soap operas, or in advertisements for motor cars, those most admired are usually those who seem to have been able to succeed in the workplace, in the economic arena. They are wealthy, suave, sophisticated, with the easy grace of those who know their *own worth*. They provide models against which we can measure ourselves or that we can attempt to live by.

To the successful go the spoils! To them belong the fast cars, the yachts, the lavish entertainments and the lifestyles of the "rich and famous". Far from challenging the central moral tenets of Western communities, the magazines and television entertainments of the West strongly reinforce them.

The West is no longer centrally concerned with sexual morality - that belongs to a past age, when people were prudish and no-one seemed prepared even to talk about the possibility of sexual adventure. It is no longer centrally concerned with violence since most of its entertainments glorify it, though it is roundly condemned in the abstract.

It is, of course, centrally concerned with social justice: in a "user pays" environment people get what they deserve! And it is centrally concerned with economic success, which is *assumed* to be related to work.

There is little evidence that people living in Western communities are evolving beyond their deep-seated moral commitment to work. After a brief flirtation with the 'evils' of 'regulation', 'protectionism' and 'social welfare' ²⁶⁴ in the 1930s-1970s, Western communities have reasserted their subordination to deregulated capitalism and commitment to:

- ★ Individual self-promotion through expanding consumption,
- ★ A 'user-pays' world,
- ★ And unconstrained 'development' of the world's economic resources.

A Personal Observation 🐦

Others have explained that the amazing efflorescence of knowledge and invention of the past three hundred years could not possibly have occurred without the capitalist work ethic. It has been the drive to 'profit', [William Booth's '10%'](#), which has brought about this explosion in intellectual exploration. I agree. Without an external goad and without a drive to harness human intelligence in this way, the achievements of the modern era would largely not have occurred.

The epitaph of the era might well be, that human beings have been driven to, and beyond, the limits of their individual and communal intellects by those myopically committed to self-promotion and the accumulation of material wealth.

The focuses of intellectual endeavor in the West have far-too-often *not* emerged from the intellectual curiosity of the researchers, but from a short-sighted drive to satisfy and shape the demands of the employment and investment marketplaces.

The forces which have channeled and circumscribed Western intellectual endeavor have seldom come from intelligent exploration and understanding of long-run consequences. They have been determined by the needs and wants of the capitalist and the consumer.

Chapter 7: Capitalism and its Colonies: Nation-States, Third World Nations, Development and Failing States

Capitalism and its colonies

Nation-states

- Who were the 'Middle-Sorts'?
- Nations as enclaves of common-interest migrants
- Colonies as the globalization of the Nation-State
- Unraveling Empires
- Taking over alien political and administrative structures

The Last Western Colony (and its Native Reserves)

After the Colonies

- A Few Assumptions underpinning post-colonial 'development'
- International forces
 - Development Agencies, Human Rights and Structural Adjustment Programs
 - Confusing Intra-national tensions with international confrontations
 - It's Unipolar or Multipolar Hegemony:
Let's All Fight for 'Freedom'!

It's time for a New World Order

- Sovereignty requires independent control of currency creation and unravelling of colonial resource privatization

Problems of nation-building

The *Appearance* of Democracy

Of the post-Cold War 1 years:

- Corruption
- Terror
- Neoliberalism

The Depressing (but realistic) Conclusion

 (13/02/16)(27/08/18)

By 1914, 84.4 % of the world's terrestrial area had been colonized by the Europeans. With colonization there came a new paradigm of development. Cecil Rhodes is reputed to have expressed this paradigm eloquently:

We must find new lands from which we can easily obtain raw materials and at the same time exploit the cheap slave labor that is

available from the natives of the colonies...

(UNESCO (2002) ^œ[International Symposium on Post-Development](#))

- ★ They were overpowered by force of arms. Thereafter, each tribe was faced with a choice of one of two roads leading to subjection: defeat or surrender...

There are various national or ethnical groups in the country [Nigeria]. Ten main groups were recorded during the 1931 census as follows: (1) Hausa, (2) Ibo, (3) Yoruba, (4) Fulani, (5) Kanuri, (6) Ibibio, (7) Munshi or Tiv, (8) Edo, (9) Nupe, and (10) Ijaw.... 'there are also a great number of other small tribes too numerous to enumerate separately...'

It is a mistake to designate them 'tribes'. Each of them is a nation by itself with many tribes and clans. There is as much difference between them as there is between Germans, English, Russians and Turks for instance. The fact that they have a common overlord does not destroy this fundamental difference...

All these incompatibilities among the various peoples in the country militate against unification.... It is evident from the experiences of other nations that incompatibilities such as we have enumerated are barriers which cannot be overcome by glossing over them.

(Awolowo 1947, pp. 24,48-9)

- ★ We define weak states as countries that lack the essential capacity and/or will to fulfill four sets of critical government responsibilities:
- fostering an environment conducive to sustainable and equitable economic growth;
 - establishing and maintaining legitimate, transparent, and accountable political institutions;
 - securing their populations from violent conflict and controlling their territory;
 - and meeting the basic human needs of their population...

We term countries in the bottom quintile "critically weak states" and deem the 3 weakest states in the world "failed states." Failed states perform markedly worse than all others - even those in their critically weak cohort...

Bottom Quintile:

Somalia; Congo, Dem. Rep.; Burundi; Sudan; Central African Rep.; Zimbabwe; Liberia; Côte D'Ivoire; Angola; Haiti; Sierra Leone; Eritrea; North Korea; Chad; Burma; Guinea-Bissau; Ethiopia; Congo, Rep.; Niger; Nepal; Guinea; Rwanda; Equatorial Guinea; Togo; Uganda; Nigeria

(^œ[Rice and Patrick 2008](#), pp. 3, 9-11)

Given the wide range of tensions, contradictory demands and confrontations to which Third World nations have been subjected by Western capitalist nations over the past 80 years, it is a testament to human resilience that there are any which still escape being classified "critically weak states".

Western people have, over the past three centuries, confidently applied their own understandings and forms of organization to the rest of the world. They have done this in the sure knowledge that these represent the most

advanced, developed and sophisticated of all forms of understanding and organization available to human beings.

To introduce those forms to non-Western people has been to start them on the road to capitalist development. It has been assumed that this enables them to by-pass the historically long and thorny route taken by Western Europeans in achieving their advanced state of organization and understanding.²⁶⁵ Chief amongst the forms of organization, thought to be most important in moving into the modern world, have been the political and economic forms of the industrialized West.

To understand the problems encountered in Third World nations over the past sixty years, we need, first, to examine a few of the presumptions underpinning Western political organization and activity as they have been shaped in concert with capitalism over the past four centuries.

Nation-states 🐼

From the 16th to the early 20th century, Western Europe experienced widespread, drastic economic reorganization. Capitalism became the ideological frame of life for the middle-classes of Western Europe. From the 17th century this capitalist reorganization coincided with a revolutionary, middle-class driven, political reorganization of the region ²⁶⁶.

Who were the 'Middle-Sorts'? 🐼

The nation-state was presumed to be comprised of citizens who, individually, first and foremost, identified with the nation rather than with regions within the nation. They saw the nation's achievements as their own; the nation's problems as personal problems; and they so committed themselves to the nation that when it became threatened, if necessary, they were prepared to die for it. Thomas Hobbes set out the requirements of such a 'Commonwealth' in his *Leviathan* (1651 Chapter 17, ^œ'Of The Causes, Generation, And Definition Of A Commonwealth') ²⁶⁷.

Capitalism is based on *individual independence*, not on *interdependence* ²⁶⁸. Its political frame has echoed the motivations of the middle ranking individuals who were at the heart of the revolutionary changes of the period. It requires 'democracy'. But this was, always, a 'democracy' of 'responsible' people - a democracy of the middle-classes. The history of voting rights in Western democracies reflects the changing fortunes of sub-populations as they have become accepted by the middle-class base which still largely controls Western democracies ²⁶⁹.

The new political entities, nation-states, represented the interests of the middle-classes. In almost every ethnic community in Western Europe, one could find these people - 'middle sorts' - who socialized and identified with each other across community boundaries and shared common interests both through the state territory in which they were living, and throughout Western Europe. These people, in the communities incorporated into each nation-state, were presumed to be not only able, but willing to subordinate their ethnic and regional interests and commitments to the interests and requirements of the larger political whole within which they were placed.

So, what was it that bound middle ranking people together in this way?

Nations as enclaves of common-interest migrants

An important feature of Western European nationhood has been the 'nationalism' of its people, their apparent identification with the nation-state and its political and bureaucratic organizations, and acceptance of the state's directive legitimacy. Because most Third World national governments have great difficulty in gaining and maintaining acceptance from their populations, we need to understand how European nation-states ²⁷⁰ attained and maintain legitimacy.

'Nation' was a term which originally referred to administrative regions of the medieval Western-Orthodox Church. These western European Orthodox Church regions were governed through bureaucratic organizations controlled by regional ecclesiastical administrators. The representatives of those regions in Rome lived in a set of enclaves known as 'nations'. As Thomas Dandeleit (1997) has explained,

it was in medieval Rome that the numerous local identities of Europe were commonly grouped under the five major "nations" of France, England, Spain, Italy, and Germany.

A rag-bag of regions not included in those named was referred to as the 'Netherlands' (the lands beyond the recognized regions).

People who lived in these regions not only thought of themselves as members of their local communities but also knew the names of the administrative regions of the Church within which they lived. Their rulers, on their accession to power, were anointed to their positions by the regional ecclesiastical administrators ²⁷¹. So, almost inevitably, over a thousand years, political aspirations became identified with the regions and with the names they bore.

The medieval use of the term 'nation', following the western European Orthodox Church's usage of the term in Rome, referred to enclaves of middle-ranking people (those who, from the late 16th century, would consider themselves the 'responsible people' of western Europe), migrants from the same region, who shared some common interest or focus in life. These were the nascent middle-classes of Western Europe, those who, by the 19th century, would espouse 'democratic capitalism'.

During this discussion, we need to remember that the term 'nation' was applied to two quite distinct ideas. The first was to administrative regions of the medieval Church; the second was to enclaves of people living outside their own administrative regions, who banded together, formed cooperative relationships and friendships and were referred to by the name of the administrative region from which they came.

More emphasis was given to 'region of origin' than to 'ethnic identity' in gaining entry and acceptance into a nation (an enclave of migrants), so that nations could consist of people who spoke different dialects or languages (the *lingua franca* was, of course, Latin), were of different ethnic ancestry, and possibly of very different skin shadings. This would prove important in the intermeshing of middle-class interests across culturally diverse regions of interconnected territories ²⁷² as 'nation-states' emerged in the 18th and 19th centuries.

Nations (as enclaves) were medieval common-interest, fraternal groups ²⁷³. Members accepted responsibility for each other and assumed support and co-operation from anyone who was identified as a group member. They developed friendships which over time expanded into extensive networks of

support and acquaintanceship. The families of people connected in these ways entertained and accommodated visitors from other areas and regions, and assumed similar support if they travelled outside of their home area. The principle of mutual support and acceptance was of central importance in claiming membership of a nation (Hobsbawm 1990, p. 16).

'Nations' of scholars existed at university centers. Each nation was comprised of people from a particular geographical/ecclesiastical area who supported one another and provided hospitality and security to visitors and new arrivals. The members of such nations maintained their links after graduating and moving to other places. One could move from a 'nation' at one university center, to its counterpart at another university center and be accepted because others in the new center already had connections in the center from which one had come.

Similar nations of merchants and traders existed, which shared identity with scholars and others identified as belonging to the same region as themselves. Networks of such groups developed throughout western Europe. A feeling of affinity emerged between those who identified with each other through membership in common networks of nations (as enclaves). It was these networked people from particular regions who would become the future electorates of emerging nation-states.

Not until the 18th and 19th centuries did the term come to include both the inter-linked people of a particular territory, and the political and bureaucratic state organization of that territory. When it did, this usually resulted from concerted political and/ or revolutionary action involving those who already saw themselves as interconnected and as belonging to the same nation.²⁷⁴

By the 18th century everyone in western Europe knew the name of the region within which they lived and identified themselves in some way as belonging to the region that bore that name. The regions which were metamorphosing into nation-states were, largely, nascent capitalist regions which had been involved in the Reformation. Most of them had renounced or greatly loosened their ties with Rome.

People living in the old medieval Western-Orthodox ecclesiastical districts seem to have had little difficulty in transferring their recognition of those districts to the emerging states and their bureaucratic structures. So, national identity (that is, nationalism) preceded the establishment of nation-states²⁷⁵.

By the late 19th century, as a consequence of the historical connection between membership of 'nations' and education, trade and other productive and 'cultured' activities, middle-class Western Europeans had become convinced that

As the individual chiefly obtains by means of the nation and in the nation mental culture, power of production, security, and prosperity, so is the civilization of the human race only conceivable and possible by means of the civilization and development of the individual nations.
(List (œ1885, Ch.15))

The nation, which for middle class Western Europeans of the 19th century, was synonymous with the state and its people, was the very embodiment of human existence. As Hegel explained in his lectures on *The Philosophy of History* :

Subjective volition - Passion - is that which sets men in activity, that which effects "practical" realization. The Idea is the inner spring of action; the State is the actually, existing, realised moral life. For it is the Unity of the universal, essential Will, with that of the individual; and this is "Morality." The Individual living in this unity has a moral life; possesses a value that consists in this substantiality alone.
((2001, pp. 53, 4.) G. W. F. Hegel, ^œ*The Philosophy of History* , [1822-1837], translated by J. Sibree, 2001, Batoche Books, Kitchener, Ontario)

Not only was membership of a nation a prerequisite for each individual human being's 'civilization', 'mental culture', 'power of production' and 'morality', the aggregation of small ethnic groupings into large nation-states was assumed to be an evolutionary inevitability ²⁷⁶ . As ^œList (1885) explained:

Between each individual and entire humanity, however, stands THE NATION, with its special language and literature, with its peculiar origin and history, with its special manners and customs, laws and institutions, with the claims of all these for existence, independence, perfection, and continuance for the future, and with its separate territory; a society which, united by a thousand ties of mind and of interests, combines itself into one independent whole, which recognizes the law of right for and within itself, and in its united character is still opposed to other societies of a similar kind in their national liberty, and consequently can only under the existing conditions of the world maintain self-existence and independence by its own power and resources. ...

A large population, and an extensive territory endowed with manifold national resources, are essential requirements of the normal nationality; they are the fundamental conditions of mental cultivation as well as of material development and political power. A nation restricted in the number of its population and in territory, especially if it has a separate language, can only possess a crippled literature, crippled institutions for promoting art and science. A small State can never bring to complete perfection within its territory the various branches of production. In it all protection becomes mere private monopoly. Only through alliances with more powerful nations, by partly sacrificing the advantages of nationality, and by excessive energy, can it maintain with difficulty its independence.

(Chapter 15)

Eric Hobsbawm put it well. For Western Europeans,

nations were therefore, as it were, in tune with historical evolution only insofar as they extended the scale of human society, other things being equal.

(1990, p. 33)

To quote the British philosopher, economist, employee of the British East India Company and, subsequently, member of parliament, J. S. Mill (1861):

The most united country in Europe, France, is far from being homogeneous: independently of the fragments of foreign nationalities at its remote extremities, it consists, as language and history prove, of two portions, one occupied almost exclusively by a Gallo-Roman population, while in the other the Frankish, Burgundian, and other Teutonic races form a considerable ingredient.

When proper allowance has been made for geographical exigencies, another more purely moral and social consideration offers itself. Experience proves that it is possible for one nationality to merge and be absorbed in another: and when it was originally an inferior and more backward portion of the human race the absorption is greatly to its advantage.

Nobody can suppose that it is not more beneficial to a Breton, or a Basque of French Navarre, to be brought into the current of the ideas and feelings of a highly civilized and cultivated people - to be a member of the French nationality, admitted on equal terms to all the privileges of French citizenship, sharing the advantages of French protection, and the dignity and prestige of French power - than to sulk on his own rocks, the half-savage relic of past times, revolving in his own little mental orbit, without participation or interest in the general movement of the world. The same remark applies to the Welshman or the Scottish Highlander as members of the British nation.

(Mill (1861) 1862 Ch. 16)

Hobsbawm has suggested that the minorities incorporated into the expanding nation-states of Western Europe accepted their incorporation as both positive and inevitable (one needs to remember that we are speaking of the interconnected middle ranking people, *not* of all those inhabitants in these regions who were excluded from middle-class networks):

... small nationalities or even nation-states which accepted their integration into the larger nation as something positive - or, if one prefers, which accepted the laws of progress - did not recognize any irreconcilable differences between micro-culture and macro-culture either, or were even reconciled to the loss of what could not be adapted to the modern age.

It was the Scots and not the English who invented the concept of the 'North Briton' after the Union of 1707. It was the speakers and champions of Welsh in 19th century Wales who doubted whether their own language, so powerful a medium for religion and poetry, could serve as an all-purpose language of culture in the 19th century world - i.e. who assumed the necessity and advantages of bilingualism. (1990, p. 35)

Middle-class Western Europeans, convinced that the social, economic, and political world was evolving towards ever increasing size and complexity,²⁷⁷ accepted that small ethnic communities must, inevitably, be absorbed into larger political structures, into nation-states.

Those states, it was believed, should be of sufficient territory, population and resources to enable involvement in the emerging international forms of trade and diplomacy developing amongst Western European nation-states and between them and the United States of America. Bigger was better! And, as ethnic and regional communities became incorporated, they inherited the rights of 'citizens' within the nation-state. So, the government could legitimately claim to represent them, as it did all other people who lived within its territory.

In speaking of nations we are speaking of the coalescence of the old medieval common-interest groups which came from a particular territory. People only identified themselves as members of 'nations' because they were distinguishing themselves from people of other regions of western Europe who shared similar interests and with whom they regularly

interacted. The middle-classes of Western Europe were co-operatively interconnected with each other not only within their own national regions, but also across national boundaries. There was a great deal of intellectual, business and social movement between the various 'national' territories ²⁷⁸.

In most Western European territories, the sense of national identity, of mutual support and co-operation among the middle-classes, long preceded the recognition of the 'nation-state' as a political and bureaucratic organization which represented the interests of people who belonged to the nation.

It was not that a government was established which claimed authority within a territory, and that people who did not already identify themselves as belonging to a common nation were required to swear allegiance to it. Rather, nationalism preceded the nation-state, which received its legitimation from the already interconnected people of the territory. Representative government came from national revolution and the establishment of political and bureaucratic systems which represented the middle-class interests of those involved in the revolution. ²⁷⁹

The nations of Western Europe included a range of middle-class people from ethnic and regional communities which saw their interests as coinciding with, or complementing those of other middle-class people with whom they identified in national government. National government could act in the interests of the whole territory, assuming support from the 'responsible' people in its various regions.

The focuses of government, its bureaucratic institutions and concerns, inevitably reflected the various interests and concerns of middle ranking people. They had become identified with the interests of the enclaves in which the sense of national identity had been forged. As nation-states emerged, middle ranking people could see their interests and concerns mirrored in government organization and policy making.

Since those people saw the government as representing their interests, they saw, in a truly Hobbesian sense, their interests as coinciding with the interests of the government. They could feel a sense of personal fulfillment in its achievements, and a sense of personal difficulty in its difficulties.

They took these understandings and commitments with them as they determinedly set out to reorganize the rest of the world in the late 19th and 20th centuries.

Colonies as the globalization of the Nation-State 🇬🇧

 (27/05/24)

European nation-states during the 19th century expanded into the rest of the world ²⁸⁰. Wherever they went they extended their political authority through the establishment of protectorates and colonies. As they did in Europe, so they did in the rest of the world. They focused on territory, and *assumed* the integration of 'responsible' people within the boundaries of the territories they controlled.

Initially, Western European governments did not see their colonial territories as independently evolving nascent nation-states. They saw them as extensions of their own nation-state. The 'colonies' were a part of the evolution of the Western European nation-state, its geographical extension into the world ²⁸¹.

Like the Bretons, Basques, Welsh, Scottish, Irish and countless other minorities in Western Europe, so with the peoples of Western Europe's colonies. They would soon realize, [as List \(1885\) had explained](#), the wonderful advantages of 'mental culture, power of production, security, and prosperity' which would be their inheritance. After all, it was obvious that 'the civilization of the human race' is 'only conceivable and possible by means of the civilization and development of the individual nations' ²⁸².

Colonial populations were identified with 'The Poor' of Western Europe and designated 'natives'. A few, usually considered to be 'aristocratic' in some way, were identified as nascently middle-class and sent to the Home Land to be educated and incorporated into the ranks of the nation-state's middle-classes: "by special favor and grudgingly made, citizens" (Houènou ^œ(1924)). It was this select Western educated elite which would be handed control as the colonies gained independence in the post 2nd World War era.

The 'responsible' people (middle-classes) in colonial territories, whether of local or European origin, were small in number and could access political processes through the institutions at the center of empire. There seemed no reason to replicate political processes in the colonies. Colonies merely required a subset of the bureaucratic administrative structures of the 'home land' which would ensure their smooth functioning and integration into the political and bureaucratic systems of the colonizing nation-state ²⁸³.

Most colonial authorities established administrative machinery throughout their territories and assumed its acceptance by the people who inhabited the governed regions ²⁸⁴. The colonial administrations became the governments of colonial territories. The head of government in the colony was, in British colonies, the 'Governor', representative of the monarch, and ceremonial head of the administration. Beneath him a hierarchy of administrative officials existed, which preserved and accentuated the social order of the Home Land. Similar authority structures were developed in most Western European colonies.

Houènou ^œ(1924), speaking of the French administrators he had dealings with in Dahomey (Benin), described:

... the daily abuses of the Colonial Policy, and in particular, of the Policy called Native Policy. This Policy is a source of perpetual vexations.

Let me illustrate: A European passing along the highways can arrest a native and condemn him to 15 days imprisonment for the sole reason that he did not take off his hat to a white man. You will say to me that these are insignificant matters; but the arbitrariness goes much farther.

The power of the Administrator is enormous. Contrary to that which happens in Europe, it is the accumulation of all powers; it is the accumulation of legislative and executive powers; it is the accumulation of judicial and administrative powers, - it is despotic power without control.

As the writer Somerset Maugham described them, colonial administrators, taken out of their European milieu, often appeared almost ludicrously self-important caricatures of their counterparts at the centers of empire.

In establishing administrative bureaucracies in colonies, colonial authorities believed they were involved in the historical evolution of those territories by linking them, through the colonizing state, into world-wide political and economic networks. It was believed that, given the evolutionary process of

constantly increasing size and complexity, colonized populations could only benefit from (and should be grateful for) the establishment of colonial administration and reorganization of their communities.

As J. S. Mill, erstwhile resident in India and employee of the British East India Company, had put it,

Experience proves that it is possible for one nationality to merge and be absorbed in another: and when it was originally an inferior and more backward portion of the human race the absorption is greatly to its advantage.
(1861, Ch. 16)

To understand the political problems faced by Third World nations in the second-half of the 20th century, we need to realize how unanticipated was their emancipation from Western European colonial status. It was simply not presumed that they were in the process of moving toward 'independence' of any kind. As Winston Churchill said in a speech before the British House of Commons on 18th June 1940,

If we can stand up to [Hitler] all Europe may be free and the life of the world may move forward into broad and sunlit uplands.

If we fail, then the whole world, including the United States, and all that we have known and cared for, will sink into the abyss of a new dark age made more sinister and perhaps more prolonged by the light of a perverted science.

Let us therefore, do our duty and so bear ourselves that if the British Commonwealth and the Empire lasts a thousand years men will say, "This was their finest hour".

The idea of grooming colonies for independence was an afterthought (in most cases post-2nd World War) of a dawning realization that, like it or not, most colonial territories were going to gain independence from their European schoolmasters. Most European governments were reluctant to relinquish control of their colonial territories but found themselves with few options.

Unraveling Empires 🌐

📅 (16/08/18) (16/10/21)

The 2nd World War proved a watershed for colonial empires. The European powers were unable, during the war, to closely maintain supervision of their colonies and many colonial administrations had unraveled through neglect. The costs of re-establishing control in the face of increasingly organized resistance from colonial populations were prohibitive ²⁸⁵. Colonial peoples had been co-opted into fighting for their European masters and had received both military training and counter-insurgency training which would serve them well as they returned home and asserted their right to independence.

Kwame Nkrumah, first prime minister of Ghana (1957-1960) and first president (1960-1966), in a 1965 book entitled *Neo-Colonialism, the Last Stage of imperialism*, provided a realistic, if jaundiced, view of the transition from colonial status to 'independence'. Nkrumah was of the same generation of African leaders as [Awolowo of Nigeria](#), [Kaunda of Zambia](#) and [Julius Nyerere of Tanzania](#). And, like them, from his perspective, 'independence' was simply the new face of Western colonialism. As he explained,

...Developed capitalist countries [will] secure the maximum return in profit from such parts of the international financial complex as they control. However much private capitalism is exhorted to bring about rapid development and a rising standard of living in the less developed areas of the world... faced with a choice, capitalism... will come down on the side of exploitation.

Yasin Kakande has neatly summed up the 21st century consequences for the peoples of former African colonies:

[T]he unchecked exploitation of the continent's natural resources by corporations from outside countries has forced desperate choices upon its citizens. Migrants looking for their own modicum of economic justice have come to the West. But, once they arrive, they discover the extraordinary extents to which they must prove their "worthiness" and acceptance in the same European nations that benefited from taking their homelands' natural resources for profit...

The continent's natural and mineral resources are targets of predatory wealth where no costs are incurred for unfettered exploitation. In many African nations, dictatorial puppets, often handpicked and supported by their Western exploiters, continue this relationship. This occurs at the expense of their own citizens who need and would benefit the most from the resources of their homelands.

Meanwhile, the continent's deprived migrants are seen as "nuisances" by white citizens in Western nations occasionally, but more often are portrayed as "burdens" that "threaten" the nation's economic livelihood.

(Yasin Kakande, [Only African Resources, Not Migrants, Are Welcomed Into Western Countries](#), *Truthout*, August 26, 2018)

Nkrumah's views remain pertinent in understanding 21st century Western attitudes toward former colonial territories:

In order to halt foreign interference in the affairs of developing countries it is necessary to study, understand, expose and actively combat neo-colonialism in whatever guise it may appear. For the methods of neo-colonialists are subtle and varied. They operate not only in the economic field, but also in the political, religious, ideological and cultural spheres.

Faced with the militant peoples of the ex-colonial territories in Asia, Africa, the Caribbean and Latin America, imperialism simply switches tactics. Without a qualm it dispenses with its flags, and even with certain of its more hated expatriate officials. This means, so it claims, that it is 'giving' independence to its former subjects, to be followed by 'aid' for their development. Under cover of such phrases, however, it devises innumerable ways to accomplish objectives formerly achieved by naked colonialism. It is this sum total of these modern attempts to perpetuate colonialism while at the same time talking about 'freedom', which has come to be known as neo-colonialism.

Foremost among the neo-colonialists is the United States, which has long exercised its power in Latin America. Fumblingly at first she turned towards Europe, and then with more certainty after world war two when most countries of that continent were indebted to her. Since then, with methodical thoroughness and touching attention to detail, the Pentagon set about consolidating its ascendancy, evidence of which can be seen all around the world.

Who really rules in such places as Great Britain, West Germany, Japan, Spain, Portugal or Italy? If General de Gaulle is 'defecting' from U.S. monopoly control, what interpretation can be placed on his 'experiments' in the Sahara desert, his paratroopers in Gabon, or his trips to Cambodia and Latin America?

Lurking behind such questions are the extended tentacles of the Wall Street octopus. And its suction cups and muscular strength are provided by a phenomenon dubbed 'The Invisible Government', arising from Wall Street's connection with the Pentagon and various intelligence services.

(Kwame Nkrumah, 1965, *Neo-Colonialism, The Last Stage of Imperialism*, Thomas Nelson & Sons, Ltd., London, Ch.18) ²⁸⁶

Most European states found themselves with huge debts to the United States, which had bankrolled the war effort and then presented European governments with the bill. For the USA, war had proved good business. The US would use the leverage it gained to reshape the world in the ways which best suited its own interests.

The United States became banker to the world, holding the mortgages of all those states which had gone into debt to fight 'The War'. It became leader of, and a major supplier of armaments of all kinds to the 'Free World' - i.e. the world which accepted and followed its ideological understandings and leadership. For the next fifty years it would live on income generated by those mortgages and new mortgages negotiated with all those Third World countries which came into its orbit as European empires crumbled.

The internal infrastructures of Western European colonial powers had all but collapsed through the war years and they simply did not have the financial means to reassert control of their colonies. The real winners in the aftermath of the war proved to be the two emergent superpowers: the USA and the USSR.

There were new kids on the block, and they were going to take over the world. Neither had been involved in the 19th Century acquisition of colonial empires. They saw no reason why the weakened European states should retain the advantages which privileged access to their colonial empires gave them.

Through the post-war years, the USSR would champion the 'right' of colonial people to independence and back this up with military training and weapons support. The USA, realizing that it was in their interest to ensure they had unfettered access to the colonies, very strongly pressured Western European governments into granting independence to colonial territories.

Western European colonial powers faced the joint pressures of a 'Cold War' between the two superpowers (as they arm-wrestled for international dominance) and US insistence on free access to their colonies. With the combined problems of national indebtedness, costs of taking sides in the developing superpower confrontation, and re-establishing their own faltering infrastructures and economies, their empires became a mill-stone which most Colonial powers could do without.

Much as they might have wanted to retain them, and however strongly they attempted to assert the right to control, one after another, colonial territories gained independence. European colonial empires crumbled over about forty years between 1945 and the 1980s.

I was involved in research aimed at grooming a British colony - The Gilbert and Ellice Islands Colony - for independence as late as the early 1970s. As a preliminary to my research I investigated the administrative structures of the colony and found that trainee ministers from the indigenous population had been appointed to each of the colonial administrative departments by the British administration. I was told that the aim was that they should learn how everything worked before taking over (some 3-4 years later).

Assuming that they would have departmental information at their disposal, and interested in their views of where things were going, I interviewed relevant ministers (there were, of course, no British counterparts in the colony since it was an administrative outpost of the British governmental bureaucracy).

They seemed genuinely surprised that I should want to talk with them. Once I began questioning them they quickly explained that they had no access to any ongoing activity or policy making in their departments. Their opinions were simply not sought by the administrative staff who generally thought them something of a nuisance. They had been given offices and titles but there was little or no 'grooming' going on!

Given the British Westminster system of parliamentary democracy, this was not surprising. In the Westminster System, there is a clearly established and carefully maintained separation between the political and administrative arms of government. Few administrative personnel knew how to 'train' future politicians - or felt that it was important to do so!

There was little long-term education or planning engaged in by any of the Western European powers as they handed governmental reins over to indigenous leaders ²⁸⁷. Territories which went from colonial to post-colonial status, simply inherited the colonial bureaucratic machinery and had political processes and institutions appended to them, often less than two years prior to gaining independence.

Taking over alien political and administrative structures 🇵🇸

 (01/06/21) (06/07/22)

Colonies moved from being bureaucratic dictatorships to 'parliamentary democracies' with almost no education of the population in democratic ideas or procedures, and often with only a single election of political leaders prior to independence.

It could be claimed that this was because their European masters had simply lost interest, or were genuinely aggrieved at losing control. However, while those might have been considerations, it was also rather naively believed that democracy of the Western European kind was 'natural' to human beings. Freed from the dictatorial and capricious control of 'chiefs' and 'warlords', it was believed that people would revel in the new found freedom which Western forms of governmental organization gave them ²⁸⁸.

Many of the problems of Third World countries seem to center on attempts to recreate, in alien environments, [Western-style 'nations' and Western-style 'nationalism'](#) amongst their peoples. In attempting to emulate Western nations, they have introduced expectations and understandings which appear to fit very poorly into the cultural understandings and expectations indigenous to the peoples of post-colonial territories.

To understand the presumptions and expectations of those responsible for establishing new nations in the post-War period, we need to understand

why they assumed the viability of such nation-states, and why they presumed that strong national sentiments amongst the people incorporated in such states would automatically follow the establishment of new nations. We also need to understand the nature of the political expectations and presumptions of the populations which have, in large measure, shaped the post-War experience of Third World nations.

A growing chorus of Third World writers has insisted on the inappropriateness of such presumptions for the government of post-colonial countries. Julius Ihonvbere is among the clearer of such voices, claiming that:

... the masses in Africa, relate to the state as an exploitative, coercive and alien structure [whose] custodians lack credibility and legitimacy and are thus incapable of mobilising or leading the people.
(Ihonvbere 1994, p. 43)

More recently, Kamilu Fage has claimed of Nigeria ²⁸⁹

... Nigerian experience leaves much to be desired. After several attempts at democratization (involving constitutional reforms, elections etc), the country is yet to evolve a viable, virile and stable democracy that will elicit popular support and or even have direct bearing on the lives of the generality of the ordinary people.

... the subtle re-emergence of the ugly signs of the past (violence, bickering and fracas in the state and national assemblies, feuds between the executive and legislative arms of the government, electoral malpractices, corruption, oppression etc) raise the fear that Nigerian democracy is still on shaky grounds.
(Fage 2007)

Richard Joseph of the Brookings Institute has given a somber description of Nigeria in 2010:

In 2005, the U.S. National Intelligence Council predicted the "outright collapse of Nigeria as a nation-state within the next 15 years." Five years later, Nigerians themselves often refer to their country as a "failed state". What most characterizes life for its citizens is insecurity. Armed robbery has recently become more terrifying with kidnapping conducted to extract ransoms. On the eve of Nigeria's 50th anniversary in October 2010, basic needs in electricity, water, and public health are unmet. Even fuel for cars is often scarce in this major petroleum exporter.

Nigeria is today a bruised and disoriented nation.
(^œJoseph 2010)

In 2021 Nigeria, long a troubled nation, is close to 'failed state' status. But, for Western 'experts' in statecraft, that is due to 'criminals, separatists, and Islamist insurgents who increasingly threaten the government's grip on power, as do rampant corruption, economic malaise, and rising poverty'.

The solution to all this is, of course, the re-involvement of Western 'experts' and their governments to clean up the resulting mess and re-establish political and civil order in the 'nation'.

John Campbell and Robert Rotberg, apparently confident that Nigeria (with more than a little help from such [neo-colonialist](#) nations as the US) can be reclaimed from its 'failed state' status, present their 'solution'. Nigeria might

yet, finally, [emerge into those broad and sunlit uplands](#) of Western nation-statehood. As they explain:

Nigeria is in big trouble. If a state's first obligation to those it governs is to provide for their security and maintain a monopoly on the use of violence, then Nigeria has failed, even if some other aspects of the state still function. Criminals, separatists, and Islamist insurgents increasingly threaten the government's grip on power, as do rampant corruption, economic malaise, and rising poverty.

Most failed states in Africa - such [as] the Central African Republic, Somalia, and South Sudan - are small or marginal; Nigeria, by contrast, boasts a growing population of 214 million. It is expected to become the world's third-largest country by population by 2050. And prior to the COVID-19 pandemic, it had Africa's largest economy or its second-largest after South Africa (depending on how one measures). That is why state failure in Nigeria is having profound consequences for the entire region-and beyond. It bodes especially ill for the stability and well-being of weak states in Nigeria's vicinity, as evidenced by the spread of jihadi and criminal groups to Burkina Faso, Cameroon, Chad, Ivory Coast, Mali, and Niger.

Nigeria's collapse can be reversed, however. Increasingly, prominent Nigerian opinion-makers are calling for an alternative to the current administration-whether through a national convention to rebuild the state from scratch, the breakup of Nigeria into smaller countries, or a domestic military takeover of the kind Nigeria has experienced repeatedly since independence in 1960. Many other Nigerians decry the government's inability to keep citizens safe but support its calls for external assistance in the form of economic and military aid.

Though, given the US track record across the world, I am more than dubious about their suggested solution to Nigeria's problems:

...[The] United States, must acknowledge that Nigeria is now a failed state. In recognition of that fact, they should deepen their engagement with the country and seek to hold the current administration accountable for its failures while also working with it to provide security and right the economy. In addition, they should engage and support Nigerian civil society as it forges what must ultimately be a Nigerian-led reconstruction effort.

(John Campbell and Robert I. Rotberg, [^œThe Giant of Africa Is Failing: Only Nigeria Can Save Itself-but the United States Can Help](#), *Foreign Affairs*, May 31, 2021)

As we have seen, Nigeria's woes are not of recent origin. The region formally ^œ[created as a colonial territory by the British in 1914](#), comprised more than 250 different ethnic groupings and over 400 different languages and dialects spoken by groups within the new colony.

It is, of course, not alone in having been contrived by European colonial powers from an agglomeration of ethnic groupings, languages and dialects in a geographical region for their own purposes. Other post-colonial nations around the world suffer from very similar internal problems, seldom addressed in the rush to 'independence' in the post 1940s world. And, in consequence, attempts at 'democratically' organized government have seldom been successful.

Uzodinma Iweala, in a 2022 attempt to find some kind of a 'solution' to the ongoing problems of Nigeria, has provided an interesting sketch of its past

experiences at building viable national governmental structures and alliances. As he explains:

Nigeria has always seemed like an impossibility. From the moment of its independence in 1960, observers questioned the country's viability as a multiethnic, multireligious state. How could a country divided among two major religions and hundreds of different ethnic groups possibly stay together? When the devastating Nigerian civil war broke out in 1967, that skepticism appeared warranted. Perhaps, many concluded, Nigeria wasn't meant to be.

Ever since the war, one of the chief aims of Nigeria's political project has been to prove the doubters, both foreign and domestic, wrong. A long line of civilian and military leaders have sought, sometimes with brute force, to preserve the unified state, which they have held up as a good unto itself regardless of its effect on the people. Each year, supposed experts from outside Nigeria declare that the state has failed and will soon disintegrate. And yet each year, Nigeria does not disintegrate. Instead, like a chronically sick patient who lacks a proper diagnosis and thus adequate treatment, it soldiers on, its condition steadily worsening.

(Uzodinma Iweala, ^œ[Nigeria's Second Independence: Why the Giant of Africa Needs to Start Over](#), *Foreign Affairs*, July/August 2022)

Any long-term viable political resolution of the national political problems of such nations is highly unlikely. They were [cobbled together for Western European purposes](#) with little or no understanding of indigenous realities. And, once established, they were 'supported' and required to persist as nation-states in a continued Western determination to retain access to and control of those regions to their own advantage. Any attempt to depart from preset Western-approved forms of government, if it challenged those interests, has been vigorously opposed

I have no 'solution' to offer. Such nations are contrived entities subject to continued exploitation by external powers. Without insulation from that exploitative interference in their affairs, it would be miraculous indeed for them to develop national political cohesion and coherence. Even if left to their own devices, as Britain's experience in the [aftermath of Roman rule demonstrates](#), it will take many years to reconfigure their geographical regions to reflect indigenous realities.

The Last Western Colony (and its Native Reserves)

Words Matter! This is Expulsion or Extermination
Once again the US, with Western approval, is complicit in genocide
There are no innocent people... So We're Killing Them All!

What rough beast, its hour come round at last,
Slouches towards Bethlehem to be born?

 Update Dates for this section

...Iraq, Afghanistan, Syria, Libya, Ukraine, Gaza...

The mask has slipped. The depravity revealed.
the true heart of a dying empire is bared...
Things fall apart; the center cannot hold;
Mere anarchy is loosed upon the world,
The blood-dimmed tide is loosed, and everywhere
The ceremony of innocence is drowned;
The best lack all conviction, while the worst
Are full of passionate intensity...

Death and destruction as far as the eye can see...

œ'Jewish Zionism' is become what 'Nazism' is: œa byword for 'Depravity'

The population profile of Israel, in 2024, is changing. As œpeople of empathic conscience choose to leave an Israel clearly being controlled by bigots, thugs and venal mega-wealth, others, ideologically sympathetic to the genocidal policies and practices of 2024 Israel, like moths to a flame, are being attracted to the excitement and promise of a 'wild frontier' of 'The West'. A promise of self-aggrandizement, rapine, and of indulging their darker natures²⁹⁰.

The depravity of elements within the Israeli population, including its 'Defense force', has become increasingly blatant. œAbu Ghraib and other œ'black site' prisons, kept hidden from public view, developed and refined the torture techniques, but Israel's Sde Teiman and Beit Lid prison guards have further developed them with both public knowledge and approval.

B'Tselem has issued a full report entitled *Welcome to Hell* (August 2024) on "more than a dozen Israeli prison facilities, military and civilian: a network of camps dedicated to the abuse of inmates as a matter of policy. Facilities in which every inmate is deliberately subjected to harsh, relentless pain and suffering operate as de-facto torture camps". ²⁹¹

Oren Ziv described The depth of public support for this Israeli program of systematic torture and humiliation of Palestinians:

...Established in the wake of the First Intifada, Force 100 is an IDF unit responsible for overseeing Palestinian detainees and repressing uprisings in military prisons. Since October, the unit has also operated the Sde Teiman military base, where Palestinians from the Gaza Strip have been detained, abused, and tortured.

The soldiers came to Beit Lid to support and demand the release of ten of their comrades who had been arrested on suspicion of raping a Palestinian detainee at Sde Teiman. The detainee, according to Physicians for Human Rights - Israel (PHRI), was hospitalized three weeks ago with severe injuries to his rectum. Earlier that Monday, protesters and far-right Knesset members amassed outside of Sde

Teiman after Israeli military police entered the base to detain the suspects, which included a commander in Force 100.

"The Military Advocate General [Yifat Tomer-Yerushalmi] loves Nukhba," read one sign outside Beit Lid, referring to the elite military unit of Hamas whose members the protesters believed were detained at Sde Teiman. "The Military Advocate General is a criminal," read another.

...Along with members of Force 100, the demonstrators included Kahanists, hilltop settler youth from the occupied West Bank, supporters of Prime Minister Benjamin Netanyahu, and viewers of the TV station Channel 14. In the past, it was possible to say that these groups were a political minority. But today, they are in the government, they run the country's law enforcement, and they are the face of Israel.

The blatancy of the depravity described by Ziv is scarcely surprising. It echoes the attitudes of Israeli leaders such as Smotrich, Gallant and Netanyahu:

Finance Minister and member of the security cabinet Bezalel Smotrich called on Monday for annihilating Israel's enemies, saying "There are no half measures. [The Gazan cities of] Rafah, Deir al-Balah, Nuseirat - total annihilation. 'You will blot out the ^œ[remembrance of Amalek](#) from under heaven' - there's no place under heaven."...

Smotrich, who also is a minister in the Defense Ministry, added that when Hamas is destroyed, Israel must "clear out, with God's help, with one blow, wicked Hezbollah in the north, and really send a message that what will happen to those who harm the Jewish people is the same as those who have tried to harm us in the past - they will be destroyed, destroyed, destroyed. And it will echo for decades to come."...

(Noa Shpigel, ^œ[Israel's Far-right Minister Smotrich Calls for 'No Half Measures' in the 'Total Annihilation' of Gaza](#), *Haaretz*, April 30, 2024)

Gideon Levy, in an unenviable Sisyphean bid to find an empathic conscience in Israel, has described the 'problem':

Can a society exist without a conscience? Can a state continue to function after its removal? Is the conscience a vital organ, like the heart or the brain, or is it like the spleen or the gall bladder, which you can live without? Perhaps it's like the thyroid: You can live without it, as long as you take a replacement for the hormone? These questions should be asked by every Israeli now, after the country underwent a total consciencectomy on October 7, 2023. Israel has been without a conscience ever since. For now, it appears to be alive...

The process that Israel has undergone in the past several months can only be described as a separation from its conscience. It had been sick for years; now it is dead. There are a myriad explanations and justifications, but the question remains, in all its force: How can a society continue to endure over time without a conscience...

(Gideon Levy, ^œ[Israel Has Had a 'Conscience-ectomy.' Can a Society Survive Without a Conscience?](#), *Haaretz*, June 12, 2024)

The problem Levy faces is that, in a search for the Israeli conscience, he is confronting a vanishing quality. Those of empathic conscience are emigrating, and those sociopathically driven by the lure of a conscienceless land within which they can freely express their own warped natures are

replacing them. How long will it be before Levy himself, disillusioned by it all, follows suit?

On the 26th of February, 2024, Mr. Ralph Wilde, the legal representative of the *League of Arab States*, before the *International Court of Justice* (ICJ), presented the League's case for the illegality of Israel's occupation of the whole of both historical and mandatory Palestine, and, further, the illegality of the United Nations' decision to pronounce the legal existence of the Jewish state of Israel in 1948.²⁹²

The clear legal case for the illegitimacy of that United Nations decision to partition Palestine and proclaim the existence of the state of Israel, alienating more than three-quarters of the historical and mandatory State of Palestine, forms the introductory passage of the League's case.

This presentation sets the scene for all that follows in this section:

œTenth Hearing: ICJ on Israeli Policies in Occupied Palestinian Territories, *United Nations*, February 26, 2024.²⁹³

On the 25th of March, 2024, The œUnited Nations Security Council passed a [resolution](#) demanding an immediate ceasefire for the month of Ramadan, the immediate and unconditional release of hostages and "the urgent need to expand the flow" of aid into Gaza. There were 14 votes in favor with the United States abstaining because "We did not agree with everything with the resolution."

For both Israel and The United States, this was now a 'non-binding resolution' for which they had not voted. Both the 'abstention' and the Israeli reaction to it were mere optics in a US election year.

It's time to replace this useless Council with something that produces more than vain symbolic gestures in the face of humanitarian disaster and blatant genocide.

With neither Israel nor the US accepting the UNSC resolution, Israel has œcontinued its monstrous, genocidal crimes against humanity, with United States' support' ²⁹⁴.

Satellites reveal the vast devastation across [the Gaza Strip](#). The new reality that the Israel Defense Forces' operations have created will affect the entire region for years. This is how it looks:

One of Israel's most dramatic acts in the war, which erupted following [Hamas' terror attack](#), is the displacement of hundreds of thousands of Gazans from their homes and the destruction of large swaths of the Strip. Residents, military officials and journalists describe scenes of vast devastation. "It's like after an atomic bomb," one of them reported in Haaretz after visiting northern Gaza.

An accurate estimation of the destruction is a challenging task due to the fog of war - and as the IDF restricts entry by journalists. But it's possible to create a map of the destruction using satellite data, which shows that at least half of all the buildings in the enclave are likely to have been damaged or destroyed, according to American researchers. Most of the destruction is in the north, but bitter fighting is also underway in the south, as is seen in the satellite data. Some 1.7 million Gazans have fled their homes during the war, and most of them are now in the south, the United Nations says. Huge tent cities have been put up along the Egyptian border. A new humanitarian, security and diplomatic reality has emerged, and it will shape the region for

years to come.

(Yarden Michaeli and Avi Scharf, ^œ[Gazans Fled Their Homes. They Have Nowhere to Return to 'It's Mind-blowing': 1.7 Million Palestinians Escaped Israel's Bombardment of Gaza. Most of Their Homes Have Been Damaged or Destroyed](#), *Haaretz*, February 08, 2024)

As the year [2023] draws to an end, 90% of the roughly 2.3 million inhabitants of the Gaza strip have been made homeless, chased by the Israeli military from the north to the south of the Gaza Strip and back, told to shelter in allegedly safe zones which are subsequently bombed. There is hunger verging on starvation, scant medical care, no fuel, no regular electricity supply, and no indication that the slaughter will end any time soon.

The reason given by the US for vetoing the Security Council resolution demanding an immediate ceasefire was that this would be 'unrealistic'. Meanwhile the German government, led by its feminist foreign minister Annalena Baerbock, demands 'humanitarian pauses' as an alternative to peace, after which the killings are to continue until 'Hamas', prepared for death by a free UNRWA meal, will finally be 'rooted out'

What is eerie is that in the unending stream of reports and commentary on the Gaza war it is hardly ever mentioned that Israel is a nuclear power...Israel has at its disposal the complete range of means of nuclear delivery, the so-called tripod: land-based, air-based, and sea-based. Israel's land-based nuclear missiles are allegedly kept in silos deep enough to withstand a nuclear attack, making them suitable not just for a first but also for a second strike.

(Wolfgang Streeck, ^œ[Master and Servant](#), *Sidecar*, December 20, 2023)

"This is the fastest decline in a population's nutrition status ever recorded. That means children are being starved at the fastest rate the world has ever seen." - Melanie Ward, *Medical Aid for Palestinians*.

1 MARCH - The news coming out of Gaza grows worse by the day, although we think each day it cannot get worse. The entire area is now on the verge of tipping into a famine. Half a million people are facing imminent starvation, according to senior U.N. officials. Yesterday, in northern Gaza, Israel opened fire on people as they crowded desperately around aid trucks in what is now being called the Flour Massacre. More than 100 people were killed, more than 700 wounded.

In the West Bank, Palestinians live in fear of what the Israelis will do to them once the IDF is finished in Gaza. The Israeli authorities have killed more than 380 West Bank Palestinians since 7 October. This does not include the many killed by rabid right-wing settlers, who terrorize their Palestinian neighbors with impunity and the support of the IDF.

As this catastrophe worsens, at this point surpassing al-Nakba in brutality, it is ever more urgent that Palestinian voices are heard....
(^œ["Starvation as a weapon of war." Palestinian voices have never been more urgent](#), *The Floutist*, March 02, 2024)

The Western reaction in response to the indiscriminate killing of Palestinians and bombing of Palestinian 'reservations' has, at best, been muted, protesting the 'failure to adequately distinguish' between 'combatants' and 'civilians'.

As though, in a population which has been subjected to decades of abuse, terror and death at the hands of Israeli 'settlers' and supporting Israeli

'authorities', there will be any true demarcation between such assumed populations of Palestinians.

The Western reaction is, of course, unremarkable. The history of Western colonialism is fraught with similar suppression of 'native populations', denial of land and property rights and 'legally' justified treatment of indigenous populations as 'lesser humans' without prior claim to their invaded homelands.

The Israeli response to Palestinian 'aggression' is merely a 21st century demonstration of Western responses throughout the colonized world to indigenous attempts to defend their legitimate rights and protest their subjugation.

And, in April 2024, Western peoples have, once again, amply demonstrated their discriminatory 'anger' in their response to the killing of 'Western Aid Workers' (their response to the indiscriminate killing of Palestinians has, at best, been muted). ²⁹⁵

The contrast between Western Mainstream Media protests at the indiscriminate killing of Palestinians over decades and the killing of 7 Western aid workers could not be more stark. Palestinian deaths and 'casualties' have simply not generated this kind of 'outrage'!

The rationale for treating Palestinians as 'illegitimate squatters', without legal right to their properties ('legitimizing' Israeli demolition of such 'unregistered' property) is a consequence of Israeli presumption of the State's right and responsibility to legitimize property ownership through land and property registration.

All property claims based on pre-Israeli forms of property title are, by this process, rendered illegitimate. with those putative 'owners' required to obtain new legal title to their properties through appeal to the land and property registration processes of the Israeli State.

Colonizing Europeans, over several centuries, have treated their invaded territories as *terra nullius* - legally deemed to be unoccupied or uninhabited - presuming their right to ignore pre-colonial property rights, opinions and concerns of the colonized in pursuing their objectives. And the colonized have learned to impotently accept this. ²⁹⁶

In December 2023 the world once again witnessed the impotence of its governments when faced with Western intransigence.

Once again, the hegemonic center of 'The West' treated the rest of the world with arrogant, dismissive contempt, and their governments metaphorically shrugged their shoulders and, displaying their impotence before the world, submissively accepted the US veto and went home!

On December 8th the United Nations Secretary-General António Guterres [∞]addressed an emergency meeting of the United Nations Security Council, called to 'discuss the catastrophic situation in Gaza....urging the body to help end carnage in the war-battered enclave through a lasting humanitarian ceasefire'.

Following that impassioned plea to council members, 'a resolution tabled late afternoon in the chamber calling for an immediate humanitarian ceasefire was vetoed by the United States'.

And, apparently, that was the end of the matter! The United States said 'No', so what could they do?

If the United Nations' most important decision making body could not decisively deal with an existing and ongoing genocide then what on earth is it there for?

In the first half of December, 2023, the only government actively attempting to punish Israel and its sponsors for their ongoing genocide is ^œthe war-torn nation of Yemen! ²⁹⁷

The psychopathic evil of that [Western colonizing Empire](#) and [its colonial proxy](#) - Israeli authorities and their Defense Forces - is being openly, arrogantly and dismissively displayed before the world in the last months of 2023 and on into 2024.

But, as The West learned the hard way, prolonged colonial oppression breeds a people who yearn to be free and that, inevitably leads to liberation movements, armed struggle, and a growing awareness that freedom demands sacrifice.

What Israel is doing to the people of Gaza will not break their spirits, it will lead to a renewed determination to be rid of their oppressors²⁹⁸.

On 5th December, 2023, five days after the 'multi-day pause in hostilities' (below) ended, the Gaza bombing has intensified and the Western Media insists on calling Israel's actions 'War'!

Words Matter! This is Expulsion or Extermination 🇮🇱

 (04/10/24) (13/10/24) (17/10/24) (20/10/24)

Words Matter! What the world has been witnessing in Palestine and Lebanon is not WAR, it is a Massacre: an act of cruel and wanton murder by psychopaths.

The Gaza populations are imprisoned victims of Genocide and the indiscriminate killing of Lebanese civilians ('because they are acting as human shields protecting 'the terrorist organization' Hezbollah') are crimes against humanity.

The United States is fully complicit in this. It provides the bombs, missiles, ammunition and air and sea cover enabling these ^œ[heinous crimes against humanity](#) and tries, despite the clear evidence, to convince humanity that it is 'doing all it can' to 'minimize casualties'!.²⁹⁹

An editorial in *The Jerusalem Post* described the long-held Jewish religious 'right' rationale for Israeli invasion and 'settling' of Lebanon:

Rabbi Yitzchak Ginsburgh called for the conquest of Lebanon and the settlement of Southern Lebanon in a letter published on Wednesday...

A gift given to the Jewish people

He highlighted that Lebanon was part of the Land of Israel and was given to the Jewish people by God, citing verses that claimed that the Land of Israel stretched until the Euphrates River. "In our generation, God gives us the ability to receive the gift [of Israel] again, to conquer and settle the land."

"Today it is clear that the time has come to conquer the Lebanese territories as well, only in this way can the threat be removed and true peace brought to the entire country. After the conquest and expulsion of the hostile population, a Jewish settlement must be established, thus completing the victory."...

Other rabbis have echoed similar calls, with Rabbi Nir Ben Artzi Shalita saying, "We need to end the war with Lebanon and a new way for the Messiah and redemption for the people of Israel will be come to be." (Editorial, ^œ[Israeli Rabbi calls for Israel to conquer Lebanon and settle it](#), *The Jerusalem Post*, September 27, 2024)

If the United States does not immediately withdraw all air and sea cover and cease delivering weaponry and monetary support to Israel then it is directly responsible for these massacres and must be held to account by the rest of the world!

DUBAI, Nov 21 (Reuters) - A Qatar-mediated agreement between Israel and Hamas for the release of hostages and a multi-day pause in hostilities is in its "final stages" and is "closer than it has ever been," a source briefed on the talks told Reuters on Tuesday.

The deal brokers the release of around 50 civilian hostages by Hamas and the release of Palestinian women and children from Israeli custody, the source briefed on the talks said.

This is the unparalleled legacy Israel and its Western sponsors present to humanity in 2024:

Hezbollah tried to project continuity of leadership and mission Saturday - saying it would continue "confronting the enemy" = as Iran's supreme leader called on followers to support the Lebanese militant group, the linchpin of Tehran's regional "axis of resistance." Israel cast Nasrallah's killing as a mortal blow to Hezbollah and a lesson to other militant groups in the region (Kareem Fahim *et al*, ^œ[Nasrallah's death stuns Lebanon, as Israel pummels Beirut](#), *Washington Post*, 28 September, 2024)

- As of January 7 at 2pm in Gaza (12:00 GMT): (^œ[updated here](#))
 - Killed: At least 22,835 - Including at least: 9,600 children, 6,750 women;
 - Injured: At least 58,416 With about 70 percent of them children and women;
 - Missing: more than 7,000;
 - Over half of Gaza's homes - 355,000 residential units - damaged or completely destroyed;
 - 370 educational facilities damaged; 23 hospitals no longer functioning, 104 ambulances damaged; 11 bakeries destroyed.

And all that was being discussed on November 21st, 2023 was a 'multi-day pause in hostilities'!

After a cynical 6 day pause (ensuring that United States' citizens could celebrate their 'Thanksgiving Day' free of media reports on the Israeli genocide in Gaza (which might remind them of the ^œ[sad and horrific genocide of their own indigenous populations](#))) on December 01, 2023, the wanton killing recommenced and ^œ[Health officials in Gaza reported](#) 178 deaths and nearly 600 injuries in the renewed bombardment.³⁰⁰.

The ongoing horror of a genocidal massacre of Gaza's population seems to have numbed the world into a fatalistic acceptance of what is happening.

Not even Israel's announcement that it intends to 'resettle' Palestinians in central African countries seems to have stirred the world's governments and international organizations to meaningful action against Israel. Shalom Yerushalmi of *The Times of Israel* explained:

The "voluntary" resettlement of Palestinians from Gaza is slowly becoming a key official policy of the government, with a senior official saying that Israel has held talks with several countries for their potential absorption.

Zman Israel, The Times of Israel's Hebrew sister site, has learned that Prime Minister Benjamin Netanyahu's coalition is conducting secret contacts for accepting thousands of immigrants from Gaza with Congo, in addition to other nations.

"Congo will be willing to take in migrants, and we're in talks with others," a senior source in the security cabinet said....

Last Monday, Netanyahu told a Likud faction meeting that he is working to facilitate the voluntary migration of Gazans to other countries.

"Our problem is [finding] countries that are willing to absorb Gazans, and we are working on it," he said.

The prime minister was responding to Likud MK Danny Danon, who claimed that "the world is already discussing the possibilities of voluntary immigration," though the idea has been roundly rejected by the international community.

(Shalom Yerushalmi, [Israel in talks with Congo and other countries on Gaza 'voluntary migration' plan](#), *The Times of Israel*, January 03, 2024)

On 27th September, 2024, in the wake of indiscriminate killing of Lebanese civilians ('because they were acting as human shields protecting 'the terrorist organization' Hezbollah') Netanyahu, [addressing the United Nations General Assembly](#), demonstrated, once again, that true evil masquerades as an angel of light.

The depraved behavior of Israel and of its leadership over many years, summed up in Netanyahu's psychopathic determination to either expel or eliminate all 'Arabs' from the 'Promised Land' (which includes much more than the current boundaries of Israel and the 'Occupied Territories') has been openly and devastatingly demonstrated in its expansion of its 'war' into Lebanon.

While Israel and the US have branded Hezbollah a 'terrorist organization' it is important to understand that Hezbollah in Lebanon, like Hamas in Gaza, is much more than a 'militant' organization. Hezbollah is not only a 'militant' group, it is also, and perhaps more importantly, [a political party in Lebanon](#) with a strong commitment to social service provision to Lebanese of whatever political persuasion.

In March 2006, an IRIN news report of the UN Office for the Coordination of Humanitarian Affairs explained the extensive nature of Hezbollah's activities:

Hezbollah not only has armed and political wings - it also boasts an extensive social development program. Hezbollah currently operates at least four hospitals, twelve clinics, twelve schools and two agricultural centres that provide farmers with technical assistance and training. It

also has an environmental department and an extensive social assistance program. Medical care is also cheaper than in most of the country's private hospitals and free for Hezbollah members. (quoted in: ^œ[Hezbollah social services](#), *Wikipedia*, accessed October 13, 2024)

On 17th September 2024, pagers, apparently bulk ordered and distributed by Hezbollah to Lebanese in all of its programs and activities ^œ[exploded, killing some and injuring thousands of others](#). As many have claimed, this was an indiscriminate 'terrorist' attack aimed at killing or maiming any person in possession of one of the pagers no matter what their reason for possessing one of the booby-trapped devices.

on 27th September, 2024, Hassan Nasrallah, the longtime secretary-general of Hezbollah, was killed in a massive Israeli air attack on Beirut. The Israeli army had claimed the assassination earlier in the day.

Continuing its obscene attacks on both Gaza and the West Bank, Israel is openly explaining to the world that it is finding a 'solution' to the 'problem' created by sustained bombing of an entire population, It will unceremoniously dump the victims in African nations bullied and bribed into accepting them. And, not content with the carnage it has wrought in Gaza and is now perpetrating in the West Bank, it continues, in October, 2024, its indiscriminate bombing of Lebanon.

Yet, still, the worlds' 'leaders' and its principal international forums fail to act.

We are witnessing the 21st century's version of the Nazi 'final solution' to the problem of unwanted 'nuisance' peoples from the territories absurdly claimed by the Jewish Zionists of Israel. It took a long time for the World to react last time. How long will it take before it decides to act to prevent a repetition of these atrocities?

Or, instead, will it be another version of the ^œ[United States' 'Trails of Tears'](#) in forced marches of US' Indigenous populations to 'reservations', with none of the perpetrators held to account?

It would, indeed, be naive to believe that, for Jewish Zionists, this 'relocation' program will conclude with the relocation of the Gazan population. Unless the World acts to stop all this in its tracks, the ethnic-cleansings will continue until all of that mythical 'Land of Israel' is emptied of its non-Jewish residents!

It is time for 'The West' to take moral and legal responsibility for ensuring that such acts of genocide and ethnic cleansing do not occur and that those involved are brought to trial.

Not one of the perpetrators, whatever their rank and whatever their 'justifications', must be allowed to escape answering for their crimes in the aftermath of it all ³⁰¹.

The world's leaders have a duty, not only to their own constituents but to humanity, to, right now, begin the process of establishing the necessary institutional structures, assembling the personnel required and compiling the lists of those who must not be allowed to escape justice.

From November 2023, the horror of the holocaust and the horror of Israel's demolition of Gaza should both be burned into the memories of all people. 'Never again' should any nation or organization be allowed to perpetrate such crimes against humanity.

But that will only happen if the world insists that, just as those responsible for Auschwitz had to be brought before an international tribunal to answer for their crimes, so must those responsible for the genocidal demolition of Gaza.

Genocide is genocide, no matter who the perpetrators and who the victims!

On December 29, 2023, South Africa ^œ[submitted a case to the International Court of Justice](#) accusing Israel of genocide against Palestinians in Gaza.³⁰²

Mike Corder described Israel's response and determination to defend itself (no doubt with the aim of miring the challenge in years of legal wrangling):

The Israeli government rejected "with disgust" the genocide accusations, calling it a "blood libel." A Foreign Ministry statement said South Africa's case lacks a legal foundation and constitutes a "vile exploitation and cheapening" of the court.

Israel also accused South Africa of cooperating with Hamas...

The statement also said Israel operates according to international law and focuses its military actions solely against Hamas, adding that the residents of Gaza are not an enemy. It asserted that it takes steps to minimize harm to civilians and to allow humanitarian aid to enter the territory.

(Mike Corder, ^œ[South Africa launches case at top UN court accusing Israel of genocide in Gaza](#), *Associated Press*, December 29, 2023)

On January 11th South Africa presented its case before the *United Nations International Court of Justice*. In a truly professional and detailed expose of Israel's genocidal behavior, the South African team presented example after example to illustrate their case. The entire presentation should become a model for those who, in future cases, prepare and present their evidence. It can be viewed in a video posted on YouTube by the United Nations ^œ[South Africa levels accusations of 'genocidal conduct' against Israel at UN Int'l Court of Justice](#).

On January 12th, Israel presented its rebuttal: ^œ[Israel defends itself against genocide case brought to ICJ by South Africa](#). *Democracy Now*, presented its considered view of Israel's performance in a video presentation entitled ^œ["Gaslighting & Cherry-Picking": How Israel Is Defending Itself at World Court on Charges of Genocide](#).

In a deft inversion of reality, the opening Israeli presentation began with the argument that 'the applicant has put before the court a profoundly distorted factual and legal picture'. It then proceeded to present its own 'profoundly distorted factual and legal picture', a masterclass, as *Democracy Now* explained, of gaslighting and Cherry-Picking' in defense of genocide bringing to mind the [United States' defense of its 2003 invasion of Iraq](#).

In 2023-4 we are confronted by a Western colonial enterprise demonstrating, once again, the true nature of The West's invasion, subjugation and exploitation of peoples around the world over the past 500 years. Those crimes against humanity have, in large measure, been buried beneath an avalanche of self-righteous propaganda.

This must not be allowed to happen now! Let's, at last, bring an end to 500 years of genocidal colonization. Never again must the perpetrators of such crimes be allowed to escape justice.

I'm sure [Houénou would have concluded](#) that, had 17th - 19th Century colonizing powers been able to access weapons such as those used by Israel in the 21st Century, they would unhesitatingly have employed them to subdue their 'native rebellions'. And the 'justifications' they would have given (had they even felt them necessary) would have been very similar to those we are hearing from the psychopathic Western colonizers of this century!

As Indrajit Samarajiva says:

This is why the open support for openly genocidal Israel comes so easy. They're following the same old genocidal program, just with modern bombs and mass media.

Genocide is the glory of Europe and the genesis of America. Hell, it's even in the Declaration of Independence....

Call the inhabitants of the land you want savages, and then mercilessly savage them. As my historical thesis goes, same shit, different day.

America inherited Britain's colonies after WWII and continued genociding natives, just with more modern machinery and more mendacity. They undertook numerous murder campaigns across the Middle East in living memory, and are now making a graveyard of Gaza, brutally accelerating the slow-motion genocide of Palestine. The same old pogromming is just the latest TV programming. To a disgusting amount of highly propagandized people, this is still a good thing.....

(Indrajit Samarajiva, [^œThe Deep Coding Of Genocide In The Western Brain](#), *indi.ca*, November 02, 2023)

We must not allow the West to bury its crimes against Palestinian people using the [self-righteous propaganda of Western colonialism](#) and we must certainly not allow the psychopaths responsible for this heinous crime to belittle it using the language of colonialism: the 'self-defense' of 'innocent settlers' and 'civilians' against 'unprovoked' native belligerence.³⁰³

Over more than 75 years, Western nations have consistently claimed that they 'support a two state solution' to the Israel/ Palestine 'problem'. And, over the past 75 years, at the same time, the aggressive, state-supported, movement of 'Israeli Settlers' into putatively 'Palestinian' lands has continued uninterrupted ³⁰⁴.

This is the very definition of 'hypocrisy': "feigning to be what one is not or to believe what one does not : behavior that contradicts what one claims to believe or feel" (*Merriam-Webster Dictionary*).

The 'problem' of the expansion of 'illegal' settlements on Palestinian lands is so large that any attempt at a 'two state solution' to it all seems not merely unlikely but patently impossible.

In an *Al Jazeera* episode of 'Centre Stage' Ilan Pappé argues that a two state solution to the Israel/ Palestine problem is no longer possible and the only solution, a unified Palestinian State including both Jewish and Palestinian peoples, is only possible if/ when the present-day Israel has 'gone through a de-Zionization (or decolonization) process'.

This, he argues, is realistically possible provided that Palestinians become politically unified, prepared to take advantage of an unravelling Israel 'disintegrating from within'.

...We can see now, the struggle within Jewish society between two camps, the secular Jews and the religious Jews, and they find it very difficult to find anything in common.

So, first of all, I think that this is disintegrating from within. I think there is an implosion of the society from within.

Secondly, the state relies so much on the United States that the moment that there is a scenario by which America, for whatever reason, not necessarily pro-Palestinian reasons, is unable or unwilling to provide the financial military aid to Israel, it has less capacity to keep its economy or military capacity.

So, I think, I'm much more clear about the disintegration of the Zionist project. I really think we're beginning to see the end of this...

œ [Al Jazeera English, Centre Stage: In Gaza now, it's worse than ethnic cleansing](#), February 25, 2024..

ISRAEL/PALESTINE

Illegal Israeli settlements

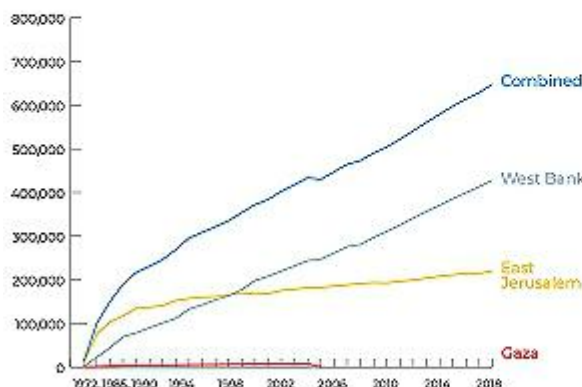

Settlements are Jewish communities built on Palestinian land.

There are between 600,000 - 750,000 Israeli settlers living in at least 250 settlements in the occupied West Bank and East Jerusalem. **Israeli settlements are illegal under international law.**

Combined:
683,553

West Bank:
463,353*

East Jerusalem:
220,200†

The population of Israeli settlers in the West Bank and East Jerusalem is growing at a faster rate than the population of Israel.

Sources: Foundation for Middle East Peace (1972 - 1999), PeaceNow (2000 - 2018).
* Israel Ministry of Interior (2020), † Jerusalem Institute for Policy Research (2020).

@AJLabs ALJAZEERA

Mohammad Shtayyeh (Palestinian Authority Prime Minister from 2019 to 2024), in an essay entitled 'The Best Way to End Israel's War in Gaza: Reviving the Arab Peace Initiative Would Resolve the Conflict - and Build a New Palestinian Reality', explained the conditions which would have to be met in achieving such a unified Palestinian leadership 'prepared to take advantage of an unravelling Israel 'disintegrating from within':

Crucially, the postwar administration of Gaza and the West Bank will have to be unified. There must be a single, inclusive Palestinian government responsible for all Palestinian territories. The PA [Palestinian Authority] will not undertake responsibility for Gaza at the behest of the Israeli government. But it would do so as part of a comprehensive agreement that is supported by the international community and the main Arab countries. In such a scenario, the

Palestinian leadership would need to consult with all Palestinian stakeholders, including political organizations and civil society institutions, to ensure that any such government is acceptable to the broadest possible constituency.

The first priority of the plan must be to provide security and ensure peace so that Palestinians and international donors can begin the urgent work of relief and reconstruction in Gaza. Any new security arrangements will need to be implemented with the help of Arab and international partners. During my tenure as prime minister, there was growing recognition that the Palestinian security sector needed serious reform and restructuring. To implement these reforms, however, the PA needed strong international and Arab support, which was only partially delivered. At the same time, the International Criminal Court, which the Palestinian leadership has granted full jurisdiction over crimes committed on Palestinian territory, must bring to justice those responsible for war crimes and crimes against humanity or impunity will continue to prevail.

Given the asymmetry of power between the Israelis and the Palestinians, progress on building a viable Palestinian state will require the strong oversight of a commanding, evenhanded mediator. Only the United Nations, with the support of the major world powers, can fulfill that role. A peace envoy should be appointed to work on the preparation of an international peace conference to secure the implementation of the plan. In case of deadlock between the two sides - for example over matters concerning security or access to border entry points - this mediator must assert absolute authority...

(Mohammad Shtayyeh, [The Best Way to End Israel's War in Gaza: Reviving the Arab Peace Initiative Would Resolve the Conflict - and Build a New Palestinian Reality](#)>, *Foreign Affairs*, July 04, 2024)

If true, that a united 'Palestinian Authority' can only be achieved through outside mediation, then Pappé's vision of a united Palestine taking advantage of an 'unravelling Israel' is mere wishful thinking.

Unless Palestinians can put aside their differences and act as a truly unified people, Israel will continue its long-standing policy of fomenting disunion between them in order to weaken their resistance and prevent their integration into a unified, genuinely 'democratic' 'multiethnic' state.

An *Aljazeera* report entitled 'Mapping Israeli occupation: Thirteen maps explain how Israel's military control over the Palestinian people affects every aspect of their lives.' described it all:

There are more than 700 road obstacles across the West Bank, including 140 checkpoints. These checkpoints severely limit Palestinian freedom of movement. While Palestinians may have to wait for hours at these checkpoints and travel along segregated road networks, Israelis can travel freely on their own "bypass roads" which have been built on Palestinian land to connect illegal Israeli settlements to major metropolitan areas inside Israel.

About 70,000 Palestinians with Israeli work permits cross through Israeli military checkpoints on their way to their workplaces every day. They work beyond the Green Line inside Israel due to the high unemployment rate in the Palestinian territories - a byproduct of the 54-year Israeli occupation....

Since 2002, Israel has been constructing a wall that stretches for more than 700 kilometres. The concrete barrier is one of the most powerful symbols of the Israeli occupation of Palestinian land.

The wall, which reaches up to eight metres high, cuts deep into Palestinian territory and has resulted in the confiscation of large swaths of fertile Palestinian land, the ghettoisation of Palestinian towns and villages, and has cut off thousands of Palestinians from social services, schools and farmland.

(Mohammed Haddad, ^œ[Mapping Israeli occupation: Thirteen maps explain how Israel's military control over the Palestinian people affects every aspect of their lives](#), *Aljazeera*, May 19, 2021)

For Jewish and Christian Zionists there has, at least since the ^œ[post WW1 League of Nations Mandate for British administration of the territories of Palestine and Transjordan](#), been no genuine drive toward establishing a 'two-state solution' to the 'problem' of the Palestinian inhabitants of the region.

'Ethnic Cleansing' is not a recent Zionist aspiration.

Since the ^œ[Balfour Declaration](#)'s commitment to establishing a "national home for the Jewish people", Zionists have always seen any attempt to establish definitive boundaries to Jewish occupation as interim compromises settling their 'right to possession' of that territory without setting the boundaries of future conquest.

Ethnic Cleansing from [The River of Egypt to the Euphrates River](#) has always been the undeclared policy of Zionism.³⁰⁵

In June 2023 the Israeli Government [handed responsibility for accelerating the movement of 'settlers' into Palestinian areas](#) to religious and ultranationalist politicians with close ties to the settlement movement. Finance Minister Bezalel Smotrich, a firebrand settler leader, was granted cabinet-level authority over settlement policies and vowed to double the settler population in the occupied West Bank.

Elaborating on his June 2023 mission to accelerate the movement of 'settlers' into Palestinian areas, on December 31, 2023, Smotrich spelt out Israel's intention of 'ethnic cleansing' Gaza:

In an interview to army radio, the far-right minister said that his "demand" was for the Gaza Strip to stop being a "hotbed where two million people grow up on hatred and aspire to destroy the State of Israel."

Without outlining his preferred method, Smotrich then suggested that the removal of around 90 percent of Gaza's residents would help achieve his goal. "If there are 100,000 or 200,000 Arabs in Gaza and not two million, the whole discourse about the day after will be different," he said.

[For further information see:]

- ^œ[Population transfer under cover of war: A visit to the forsaken land of settler militias](#)
- ^œ[Israeli rightists are trying to reframe a Gaza population transfer as a 'moral act'](#)
- ^œ[Israeli lawmakers keep pushing for transfer under the guise of humanitarian aid](#)

The Religious Zionism party chairman then noted that in order to regain security, Israel must control the Gaza Strip, and that "in order to control the territory militarily over time, you must also have civilian presence there."

Smotrich's comments are the latest in a growing list of troubling remarks by Israeli lawmakers to seemingly support expelling Gazans en masse out of the Strip in order to ensure Israel's security after the war...

(Israel News, ['100-200,000, Not Two Million': Israel's Finance Minister Envisions Depopulated Gaza](#), *Haaretz*, December 31, 2023)

Since June 2023, aggressive settler invasions of Palestinian lands, including killing those who resisted, increased dramatically. Israel had, effectively, declared an all-out war against the Palestinian populations of both The West Bank and Gaza. All with explicit United States' endorsement and both military and diplomatic support ³⁰⁶.

In October 2023 Hamas, the elected government of Gaza, in an act of desperation in the face of unprecedented violations of Palestinian rights and responsibilities over the past several months, attacked Israel. ³⁰⁷

After [seventy five years of Western colonial invasion and expropriation of Palestinian lands and livelihoods](#), Palestinians effectively retaliated to that invasion and subjugation, launching an attack on the self-proclaimed 'only democracy in the Middle East'.

The Israeli response has been horrific. As the Israeli Defense Minister Yoav Gallant insisted in a comment reminiscent of Nazi explanations of concentration camp victims, ["We are fighting human animals"](#)

A 12 October 2023 United Nations report described what was happening:

Humanitarians are continuing to support Gaza's population as best they can. The UN World Food Programme (WFP) said that together with UNRWA it delivered fresh bread from "bakeries still able to operate" and food to over 175,000 displaced people across 88 shelters on Wednesday, with plans to "reach over 800,000 people across Palestine".

The humanitarian affairs coordination office (OCHA) reported that mass displacement has been continuing, increasing by 30 per cent in just the previous 24 hours, said UN Spokesperson Stéphane Dujarric, briefing reporters in New York.

This brings the cumulative figure to more than 338,000, "of whom over two thirds are taking shelter in schools run by UNRWA", the UN Relief and Works Agency, he added. Nearly 218,000 internally displaced people (IDPs) are sheltering in 92 of their schools.

More than 2,500 units of housing have been destroyed or severely damaged and rendered uninhabitable, while nearly 23,000 others have sustained moderate to minor damage.

At least 88 education facilities have been struck, including 18 UNRWA schools, two of which were used as emergency shelters for displaced people, as well as 70 Palestinian Authority schools.

This means that for the sixth consecutive day, more than 600,000 children have had no access to education in a safe place in Gaza", said the Spokesperson.

(^œ[Humanitarians call for urgent aid access to Gaza](#), *UN News*, 12 October 2023)

Once again the US, with Western approval, is complicit in genocide

With ^œ[thousands killed, many more injured](#), and incessant indiscriminate bombing, Gaza with its trapped and abused population is being systematically demolished. John Helmer summed up the situation on 21 October, 2023:

On the Gaza front, Hamas has fought the IDF to a standstill outside the Gaza border wall. The Israel Air Force has dropped about 4,000 tonnes of bombs per week, 8,000 tonnes to October 21; that is more than the US Air Force dropped on Afghanistan in the peak year of 2019.

More than 3,500 Palestinians have been killed so far, including at least 1,030 children and hundreds of family units; more than 12,500 people have been injured, one million Palestinians displaced, and thousands of homes destroyed. About 1,200 are missing believed to be trapped under the rubble.

The Israeli and US government record, reported by the Institute for the Study of War (ISW) in Washington, documents the continuing firing from Gaza into Israeli territory in what the ISW calls its "^œ[Iran updates](#)".

A prolonged IDF siege threatens to kill several hundred thousand Palestinians by starvation, dehydration, disease, and a combination of artillery and aerial bombardment, while leaving the Hamas forces relatively unscathed and waiting to inflict a higher rate of casualties on the IDF than it has ever experienced.

...On the northern front across the Lebanon border, there have been exchanges of missile, drone, anti-tank rocket, artillery, and mortar fire between the IDF and Hezbollah. There have been casualties on both sides. Border settlements on the Israeli side have been evacuated to the south....

(John Helmer, ^œ[Memo On The Final Solution For One State - Israel Or Palestine](#), *Dances with Bears*, October 21, 2023)

And, in the midst of this classic Western colonial response to 'native unrest' in its colonies, The United States, with Western approval, has colluded in the genocide:

The Pentagon has deployed two aircraft carriers - and their supporting ships - to the eastern Mediterranean since the Israel-Hamas conflict started.

The ships are meant as a deterrent to ensure the conflict does not expand, but bring a significant amount of power to a region that already hosts a number of US military ships, planes and troops.

(^œ[US aircraft carriers: What they bring to the Middle East](#), *The Straits Times*, 16 October 2023)

Eight days later, with Israel blocking all humanitarian assistance and incessantly bombing Gaza, *Defense News* provided a summary of US 'support' weaponry being committed to Israel's 'defense' against 'Hamas Terrorists'³⁰⁸:

U.S. Defense Secretary Lloyd Austin recently announced the Defense Department is also deploying a Terminal High Altitude Area Defense battery and Patriot air defense battalions to the region.

By providing Iron Domes, the U.S. continues to widen the spigot of security aid entering Israel. In the week after Hamas' attack, Pentagon and Israeli officials announced the arrival of American aircraft stocked with air defense supplies and munitions. It has since expanded this aid to include artillery rounds, armored vehicles and precision-guided munitions, according to Israeli and American officials.

The supply effort is just one stream in a larger outpouring of American support....

(Noah Robertson, Bryant Harris and Jen Judson, ["US agrees to send two Iron Dome batteries to Israel"](#), *Defense News*, October 25, 2023)

The sociopathic core of Western Capitalism is becoming increasingly obvious.

Not only has it [carpet-bombed](#) those it designates '[enemies](#)', '[terrorists](#)' and '[threats](#)': destroying homes and lives and leaving devastation in its wake, in 2023 It has protected its protégé, Israel, from outside attack while it proceeds with the psychopathic demolition of its rebellious native reserve³⁰⁹.

This Hamas led rebellion against Palestinian oppression is the culmination of years of indiscriminate Israeli violence:

"After this operation there will not be a single Hamas building left standing in Gaza, and we plan to change the rules of the game," said armed forces deputy chief of staff Brigadier General Dan Harel...

"We are hitting not only terrorists and launchers, but also the whole Hamas government and all its wings," General Harel said.

At least 57 civilians, including 21 children, have been killed in the Israeli bombardment, a UN spokesman said.

(Adel Zaanoun, ["Israel bombs Gaza in 'all-out war' on Hamas"](#), *News.com.au*, September 17, 2009)

That was 2009, but it could have been yesterday, last week, last year... A trapped and brutalized people, blamed for resisting Israeli oppression, for maintaining their identities and their self-respect, refusing simply to be victims.

Just in case the world has forgotten what European colonial expansion looked like: the subjugation of countries and communities through brute military force, Israel continues to remind us.

On October 12, 2023, Hamas, having survived years of determined Israeli attempts at bombing and destroying 'not only terrorists and launchers, but also the whole Hamas government and all its wings', is once again under attack. And, of course, Israel, the victim of 'unprovoked' belligerence by 'Hamas Terrorists', has no option. Once again, the Israeli 'Prime Minister promises to make Hamas understand they "have made a mistake of historic proportions" for a war "we didn't want".³¹⁰

John Maggio, in yet another report by a Western reporter entitled 'Israel Declares War After Attacks From Hamas', described the scene:

Palestinian militant group Hamas has launched an attack on Israel, firing rockets from the Gaza Strip and taking hundreds of soldiers and

civilians as hostages over the border.

Israeli Prime Minister Benjamin Netanyahu denounced these attacks on X, formerly known as Twitter. The Prime Minister promises to make Hamas understand they "have made a mistake of historic proportions" for a war "we didn't want."

Hamas entered Israel on Saturday, October 7, attacking villages, military bases, and a music festival near the border. Some of the Hamas militants came across the border by breaching the several miles of border fencing between the Gaza Strip and Israel, while others flew across the border with motorized paragliders....

The international community has had a mixed reaction to the attack. Numerous landmarks have depicted the Israeli flag and its colors as a show of support, including the Brandenburg Gate in Berlin, New York's Empire State Building, a screen in the Ukrainian capital of Kyiv, the Sydney Opera House, and the White House in Washington, DC. Just outside the UK's Israeli embassy, thousands of pro-Palestinian marched, letting off fireworks and chanting, "Israel is a terrorist state" and "free Palestine." Similar demonstrations have sprung up across the US, including in New York's Times Square and outside the Israeli consulates in Atlanta and Chicago.

(John Maggio, [Israel Declares War After Attacks From Hamas, The Tower](#), October 12, 2023)

The multipolar 21st century will be a violent one if nations tolerate Western (or any other) colonial invasion and occupation with its common response when 'native reserves' become 'troublesome':

Indiscriminate destruction and thousands of homeless victims

Damage caused by Israeli airstrikes in Beit Hanun in the northern Gaza Strip (Mahmud Hams / AFP/Getty Images)

The work of bigots, thugs, charlatans and venal mega-wealth, armed and funded by the center of world capitalism: the United States of America³¹¹. [Sociopathically](#), callously [mowing the grass](#)', with most of the Western World providing either implicit or explicit support:

Recent violence in Jerusalem and airstrikes on Gaza - which have injured hundreds of people and killed dozens, including children are having a devastating impact on communities in the Occupied

Palestinian Territories (OPT), the international medical humanitarian organization Doctors Without Borders/Médecins Sans Frontières (MSF) said today. MSF said the force used by Israeli police is unacceptable.

"The Israeli bombing is incredibly heavy and stronger than previous bombing campaigns," said Hellen Ottens-Patterson, MSF head of mission in the OPT. "Relentless bombing has destroyed many homes and buildings all around us. It's not safe to go outside, and no one is safe inside, people are trapped. Emergency health workers are taking incredible but necessary risks to move around."

From the evening of May 10 to the morning of May 13, the Gaza Ministry of Health reported that Israeli airstrikes had killed at least 67 people, including 17 children, with nearly 400 injured. The Israeli authorities reported the death of seven people as a result of rockets and missiles launched by Palestinian militant groups in Gaza during the same period.

([Heavy Bombing by Israel is causing a catastrophic Situation in Gaza](#), *Médecins Sans Frontières*, May 13, 2021)

A "mutual and simultaneous" ceasefire was declared between Israel and Hamas to the David and Goliath (Israel would do well to remember the conclusion to that!) conflict between Hamas and Israel (beginning on Friday 21st May 2021 at 2 a.m.).

But this is, of course, merely the conclusion to this round of Israeli atrocities against Palestinian communities both in the occupied territories and within the borders of Israel. The checkpoints remain, Israeli control of the occupied territories remains. Israel will continue settling land it seized and occupied through war with its neighbors, while simultaneously relegating its Palestinian citizens, who represent a fifth of the Israeli population, to increasingly abject, second-class status³¹²

Khalil Shikaki summed up this 2021 version of Israel's ongoing 'mowing of the grass':

The current confrontation is unfolding across four theaters. The Gaza-Israeli military bombardment has destroyed civilian infrastructure and killed more than 200 Palestinians, 30 percent of them children, and ten Israelis. Ethnonational tensions within Israel have sparked unprecedented intercommunal riots and violence between Arabs and Jews. Palestinians and Israeli police, extreme Jewish nationalist-religious groups, and settlers are in a standoff in East Jerusalem over access to Muslim holy places and the planned evictions of Arab families from the Shaikh Jarrah neighborhood. And in the West Bank, tensions are high after Israeli forces killed four Palestinian demonstrators and injured dozens more on May 18, a day of protest that engulfed major Palestinian cities. Nonetheless, tensions there remain contained by joint PA [Palestinian Authority] and Israeli efforts.

These dynamics have been building since Israel invaded Gaza in 2014. That war marked the end of any real hope of striking a deal to end the conflict, as then U.S. Secretary of State John Kerry had been working to do. After 2014, relations between both sides worsened and the prospect of a two-state solution gradually diminished....

There should be no illusion about the role of the international community here. At best, Arab states and others, including Washington, can help manage the conflict only by making the status quo sustainable. They do not, however, have the capacity or political

will to force Israel to respect international law or Abbas and the PA to respect the norms of good governance. As hard as it may be, Israelis and Palestinians must do that themselves.

(Khalil Shikaki, ^œ[Fighting in Gaza Marks the Start of a More Violent Era: The Search for a Two-State Solution is Over](#), *Foreign Affairs*, May 19, 2021)

Houènou [provided a bleak African perspective](#) on the 'colonial experience':

Europe has inaugurated in the Colonies an area of veritable savagery and real barbarism which is carried out with science and premeditation - with all the art and all the refinement of civilization. The unfortunate natives have mingled their destinies with yours...

The USA has, without accepting responsibility for the results, armed and funded this murderous regime and must be held responsible for Israel's behavior. If Western nations are not prepared to condemn both Israel and the United States for all this then they share complicity!

A song from my childhood, sung with feeling and reverence by members of the congregation, remains with me even now. Its first two lines were:

Not to Sinai! Not to Sinai!

But to Zion We've arrived...

And, when I asked what it meant, those deeply devout Pentecostals opened their King James Bibles and turned to the Book of Hebrews, Chapter 12 Verses 18 and 22:

For ye are not come unto the mount that might be touched, and that burned with fire, nor unto blackness, and darkness, and tempest...

But ye are come unto mount Sion, and unto the city of the living God, the heavenly Jerusalem...

And they explained as simply as they could to an enquiring child: "We are not saved by 'Works', not saved by adhering to a Law which can only condemn us: We are saved by Grace, through the infinite and tender care of a loving God. Sinai stands for an impossible set of laws; Zion stands for the tender love of God for all His creatures and creation. This song reminds us of this fact and reminds us also that there is only one command: Love God and learn to love all his creatures and creation as He does. As Jesus commands us":

Love the Lord your God with all your heart and with all your soul and with all your strength and with all your mind and Love your neighbor as yourself.(Luke Ch.10 V.27)

This command and the accompanying story of the Good Samaritan is founded in the Book of Leviticus:

(08/04/19) The foreigner residing among you must be treated as your native-born. Love them as yourself, for you were foreigners in Egypt. I am the Lord your God.(Leviticus Chapter 19 Verse 34)

This was, indeed, the vision of a Zionist Utopia, given substance through the late 19th and early 20th centuries. As Yuval Achouch and Yoann Morvan describe:

The Zionist utopia gave birth to another more specific utopia - the kibbutz - that developed in Palestine as a network of primarily agricultural communities starting in 1910. Influenced by the ways of

thinking ranging from anarchism to socialism in its every form, the members of the first kibbutzim (plural of kibbutz, in Hebrew) set themselves in the forefront of a new type of socialist revolution. The kibbutzim multiplied: 7 in 1920, 32 locations in 1930, 85 in 1940 and nearly 150 on the eve of the State's birth in 1947 (Avrahami, 1998). The main tool of the Zionist national structure, the kibbutz was also one of the most downright successful socialist experiments in the world.

(Yuval Achouch and Yoann Morvan, ["The Kibbutz and "Development Towns" in Israel: Zionist utopias: Ideals ensnared in a tormented history](#), Université Paris Ouest Nanterre La Défense, UMR LAVUE 7218, Laboratoire Mosaïques, 2012, Utopia and Spatial Justice, 5, May 2017)

So, what has gone wrong? Where is that utopian vision of an inclusive, caring, integrated community of human beings in the early 21st century?

What an inspiration to the world such a society would have been. But, like all such visions, it has been overtaken by bigots, thugs, charlatans and venal mega-wealth.

Hagai El-Ad, in a *New York Times* Opinion contribution focusing on an upcoming election in the self-proclaimed 'only 'real' democracy in the Middle East', entitled 'Democracy, Israeli Style: An election, a peace plan and [an endless occupation](#)', summed up the 21st century reality:

Unless the international community... mak[es] Israel finally choose between further oppression of Palestinians and facing real consequences, the occupation will continue. The Trump administration, clearly, isn't up to this task. But the United Nations, including the Security Council, key member states of the European Union - Israel's largest trading partner - and international public opinion all have ample leverage. And Americans who sincerely believe in human rights and democracy, not just as empty slogans or bargaining chips but as genuine demands, need not wait until 2020 to flex their political power.

Together with the systemic overtaking of lands and the imposition of restrictions on freedom of movement, the denial of political rights was one of the cornerstones of apartheid South Africa. That country, too, considered itself a democracy.

Many Israelis will consider April 9 a celebration of democracy. It's not. This Election Day should be nothing more than a painful reminder of a deeply undemocratic reality, one that the Trump administration seems pleased to perpetuate - and which the rest of the international community will continue to allow until it finally stops looking the other way. We, the nearly 14 million human beings living on this land, need a future that is worth fighting for: one based on the common humanity of Palestinians and Israelis who believe in a future of justice, equality, human rights and democracy - for all of us.

(Hagai El-Ad, ["Democracy, Israeli Style: An election, a peace plan and an endless occupation](#), *New York Times*, April 7, 2019)

Shlomo Ben-Ami has summed up the predictable outcome of the 2019 Israeli election:

After another election dominated by disinformation and smears against Israeli Arabs, Prime Minister Binyamin Netanyahu has secured a fourth consecutive term. The outcome is an indictment of Israeli democracy, and particularly of the Israeli left and center, which responded to Netanyahu's open racism with pablum and platitudes...

Sadly, the election leaves no doubt about what awaits Israel in the coming years. A cabal of Netanyahu cronies and family members, racist messianic settlers, and Orthodox parties with opportunistic designs on the state budget will drag Israel toward a new single-state reality that will resemble apartheid South Africa.
(Shlomo Ben-Ami, [Israel Doubles Down on Illiberal Democracy](#), *Project Syndicate*, Apr 10, 2019)

There are no innocent people... So We're Killing Them All! 🇮🇱

 (18/12/17) (10/01/18) (15/05/18) (21/01/19) (07/04/19) (23/05/18) (22/01/19) (30/12/23)
(20/06/24)

Twenty-first century Israel is the very antithesis of utopian Zionism, displaying a Godless [sociopathic disregard](#) for that Levitical command: 'The foreigner residing among you must be treated as your native-born. Love them as yourself, for you were foreigners in Egypt. I am the Lord your God.'

This morning I woke to a news report telling me that Israel was bombing Gaza because its people would not play dead; like a man who has his foot on the throat of another, telling him that this is his fault because he keeps on 'struggling'. As an Israeli spokesperson put it: "We have to bomb them because they keep shooting rockets at us".

This was [written on 4th December 2012](#).

Nothing has changed! The provocations remain³¹³:

- US president Trump (2018) declared that the US embassy will move from Tel Aviv to Jerusalem - but that is nothing new. US presidents have declared this to be their intention for the past several decades³¹⁴;
- [Illegal Israeli settlement building on occupied and expropriated Palestinian land](#) has continued apace, but that has been true for decades;
- [Israeli checkpoints throughout the remaining 'Palestinian' territories](#) (looking more and more like impoverished Bantustans from South Africa's darkest apartheid period) remain;
- The checkpoint 'guards' (how prison-like the terms have become) are armed and increasingly willing to use deadly force to impose their authority. As Israel's Defence Minister, in 2018, [Avigdor Lieberman explained](#): "there are no innocent people in the Gaza Strip".

John Helmer described the attitude, still prevalent among both Israeli Defense Force leaders and among many Israeli citizens, three months into Israel's October 2023~ murderous campaign in The Gaza Strip:

- Since the start of Israel's genocide of Gaza, it has been the claim of the Israelis, their lawyers, and allies that there are no innocent civilians in Gaza, so they say that killing them all is neither a genocide nor a war crime.
- Israel's President Isaac Herzog [said it](#) in India in October. US Congressman Brian Mast [said it](#), following the Israeli lead.

The US Navy analyst who spied for Israel and served half a life in US prison for his treason has ^œdeclared it in print. A French-Israeli lawyer ^œhas argued the legality on French television.
(John Helmer, ^œBlow The Gaff, *Dances With Bears*, December 27, 2023)

➤ And the Israeli political establishment (incongruously proclaiming itself ^œthe only 'true democracy' in the region - despite its peremptory treatment of non-Jewish communities and people over many decades - ^œanother eerie echo of South Africa's apartheid era³¹⁵) has become increasingly open in admitting that it has little or no intention of allowing the emergence of a truly independent, sovereign Palestinian state.

All those Western states which have either actively supported Israeli depredations in Palestinian areas (or have implicitly endorsed them through silence and positive interaction with the Israeli state) share complicity in this anachronous colonial enterprise. Conscience-salving 'aid packages' to Palestinian communities do not absolve those states from such complicity.

Michelle Alexander has explained the 'problems' envisaged by those who fail to speak out: placing expediency over morality in a time when the world is in desperate need of moral leadership³¹⁶:

...Our elected representatives, who operate in a political environment where Israel's political lobby holds well-documented power, have consistently minimized and deflected criticism of the State of Israel, even as it has grown more emboldened in its occupation of Palestinian territory and adopted some practices reminiscent of apartheid in South Africa and Jim Crow segregation in the United States.

Many civil rights activists and organizations have remained silent as well, not because they lack concern or sympathy for the Palestinian people, but because they fear loss of funding from foundations, and false charges of anti-Semitism. They worry, as I once did, that their important social justice work will be compromised or discredited by smear campaigns.

Similarly, many students are fearful of expressing support for Palestinian rights because of the McCarthyite tactics of secret organizations like Canary Mission, which blacklists those who publicly dare to support boycotts against Israel, jeopardizing their employment prospects and future careers.

(Michelle Alexander, ^œTime to Break the Silence on Palestine, *New York Times*, January 19, 2019)

In the face of such moral cowardice in Western communities, what is left for Palestinians to do but to futilely protest their impoverishing dispossession and imprisonment? ³¹⁷

I was brought up on the horrific stories of the Warsaw Ghetto during World War Two³¹⁸. A trapped and brutalized people were blamed for resisting Nazi oppression, for maintaining their identities and their self-respect and refusing simply to be victims. I was inspired by those stories (and I still am!).

Now, I am witness to similar atrocities, but now I am supposed to accept that the behavior is reasonable because it comes from the West! (Yes The West!) No, this is not a 'Jewish' problem, any more than the atrocities of the

past, committed against indigenous inhabitants of North America and many other colonial and post-colonial territories, were 'Protestant' or 'Roman Catholic' problems (and yes, Israel is a Western colony, politically, financially and militarily supported by the West; replete with its own nuclear arsenal and degrading and degraded 'native reserves'³¹⁹).

The charters and legislative enablers contrived by European governments to justify, in their own minds, the subjugation and dispossession of colonial populations, is matched by similar legalisms of the past 50 years to justify Israeli activity³²⁰. This report to the US Congress: Jeremy M. Sharp, ^{ae}U.S. [Foreign Aid to Israel](#) (Congressional Research Service RL33222, April 10, 2018) gives an interesting summation of the importance of US involvement in Israel's economic and military strength. As the 2016 version of the report said:

Israel is the largest cumulative recipient of U.S. foreign assistance since World War II. To date, the United States has provided Israel \$127.4 billion (current, or non-inflation-adjusted, dollars) in bilateral assistance. Almost all U.S. bilateral aid to Israel is in the form of military assistance, although in the past Israel also received significant economic assistance.

At a signing ceremony at the State Department on September 14, 2016, representatives of the U.S. and Israeli governments signed a new ten-year Memorandum of Understanding (MOU) on military aid covering FY2019 to FY2028. Under the terms of the MOU, the United States pledges to provide \$38 billion in military aid (\$33 billion in FMF grants plus \$5 billion in missile defense appropriations) to Israel. This new MOU will replace the current \$30 billion 10-year agreement, which runs through FY2018.

...In addition, under the terms of the new MOU, the Administration pledges to request \$500 million in annual combined funding for joint U.S.-Israeli missile defense programs such as Iron Dome, Arrow II and Arrow III, and David's Sling. Previous MOUs did not include missile defense funding. Finally, as part of the new MOU, it has been reported that Israel pledged to reimburse the U.S. government if Israel receives more congressional assistance for FMF or missile defense in the last years of the current MOU (2017-2018). Israel also may have pledged not to request that Congress appropriate regular or supplemental military aid to Israel above the agreed upon annual amounts in the 2019-2028 MOU except in emergency circumstances, such as a regional war. In response, many Members of Congress have reiterated that funds pledged by the executive branch in any MOU are always subject to Congressional approval and that Congress may appropriate funds as it sees fit....

This is a Western problem; yet another display of a predilection for blaming victims for the consequences of aggressive self-interest which stretches back at least to the late 15th century: they shouldn't get in the way; they need to accept that times are changing; they 'need to adapt'; they need to 'compromise'.³²¹

(See [Who were 'The Poor'?](#) for some of the treatment meted out to their own 'poor' by 18th century British elites.)

The trajectory of this last 'born out of time' Western adventure into colonialism is ominous.

As Yeats presciently described it:

Turning and turning in the widening gyre
The falcon cannot hear the falconer;
Things fall apart; the centre cannot hold;
Mere anarchy is loosed upon the world,
The blood-dimmed tide is loosed, and everywhere
The ceremony of innocence is drowned;
The best lack all conviction, while the worst
Are full of passionate intensity...
...What rough beast, its hour come round at last,
Slouches towards Bethlehem to be born?
(W. B. Yeats, *The Second Coming*.)

After the Colonies 🇳🇮

Following the Second World War, Western imperial powers, with varying degrees of reluctance, moved out of their colonies. As they did so, they created 'new nations', with responsibility for government usually inherited by Western-educated elites. Their training, based on Western European understandings of the world, led them to believe that Western forms of political and administrative organization were essential to the ongoing well-being of their people.

Most European commentators simply assumed that where there was a nation-state one would soon find an emerging sense of nationalism. The viability of the nation-state was taken for granted and political failure could only result from political and economic ineptitude and/ or from a failure to provide properly representative government. The subsequent histories of post-colonial states, in large part, reflect attempts to adapt Western nation-state organization to their territorial and ethnic realities.

Obafemi Awolowo's (1947) description/explanation of [Nigerian realities](#) was indeed prescient (and applicable to many other post-colonial nation-states).

Amongst the important influences on governments and people in Third World countries have been the reification of 'the state' and 'the people' in most discussion of Third World nations and peoples. This has been accompanied by the formulation of governmental policies based on that reification.

Instead of squarely facing and taking into account the ethnic diversities of post-colonial nation-states, there has been a belief in their inherent unity and ability to be treated as unified wholes. Their post-colonial reorganization has usually been undertaken as an exercise in 'modernizing' inherently homogeneous nation-states.

The modernization thesis,³²² espoused in various forms and with various emphases by most development specialists over the past fifty years, has been an optimistic one. It has assumed that, for those nations which genuinely and consistently implement the necessary social, political and economic changes, transformation into modern industrialized nation-states is inevitable.

A Few Assumptions underpinning Post-Colonial 'Development' 🇳🇮

The state has been assumed to be a self-existent entity, separate from the communities which it controls, and able to impose necessary changes, however radical, on its populace³²³. Important responsibilities placed on new nation-states by development and 'nation-building' specialists have included establishing those institutions necessary to economic development, and providing the social and political climate necessary to stimulate self-interested, competitive material accumulation. It has been assumed that this would result in an inevitable 'take-off into self-sustained economic growth' (cf. Rostow 1956, 1961).

Because most political and economic theorists and practitioners believe that 'traditional' societies are being transformed into modern societies, with traditional features destined for oblivion, Third World communities have been regarded as transient. Problems encountered by 'traditionally oriented' individuals and communities are assumed to be, in large measure, consequences of this shift to modernity. So, rather than focusing on the

social problems of such communities, one needs to step up the pace of modernization.

Third World governments, it has been believed ³²⁴ should, therefore, in the face of the breakdown of law and order and social cohesion in traditional communities, more rigorously implement those measures which will transform them into industrialized nation-states, with all the advantages of such a transformation.

The dissolution of the old is a necessary precursor and concomitant of modernization and the state should keep its eyes firmly fixed on that goal, not deviating to attend to problems which are inevitable, but transient consequences of moving toward it. As Sangmpam put it:

... modernization theory assumes an imaginary society because the real society in the Third World is perceived as 'transient'

... Various solutions have been proposed to combat underdevelopment. Central to these solutions is the role assigned to the state as the 'engine of development'. Until recently, it was thought that an authoritarian state could better perform 'developmentalist' tasks.

In recent years, the state has been invested with the capacity to move toward democracy, which presumably will lead to socioeconomic development. The belief in the state is reinforced by the call to 'bring-the-state-back-in', according to which the state and its policies reflect almost autonomous institutions and the actions of those occupying these institutions.

(Sangmpam 1994, p. 1)

This assumes a 'government' separate from the people it governs, with political leaders somehow separate from and able to impose their policies on the populace (echoing colonial administrative practice). All this is based, of course, on a reification of 'government' and the separation of a 'political environment' from other 'environments' such as the 'economic' and the 'social' (see [People and recognized Environments](#)). It also assumes the depersonalization of government and a clear separation between its political and administrative arms, that is institutional, routinised Western-style government (see Max Weber (1968)).

Politicians, in Western countries, are usually identified with their parties and platforms. The people they represent assume that they will support their party in parliament and only secondarily focus on the local needs and interests of the electorate. Members of parliament are insulated from the impersonal institutional bureaucracies through which government policies are carried out.

In the Third World, these presumptions are usually difficult to sustain. Political activity is commonly not separate from other forms of activity, and those with political power exercise it personally. Political parties often find it difficult to pursue a coherent set of policies since members of parliament are focused on their own electorates' concerns. That is, government, both in formulating policy and in the delivery of services is *personalized* ³²⁵.

For people who live in communities where it is both natural and proper for leaders to be personally connected with their followers, this personalization is unexceptional. Government is not separate from the people, and politicians access the administrative departments of government through networks of patron-client relationships which link not only the

administrative bureaucracy and politicians, but also politicians and their constituents.

International forces 🇺🇸

From 1945 to 1990, post-colonial nations were subjected to a forty-five year period of 'cold war' between the two 'superpowers' which emerged from the Second World War. Both superpowers held contradictory, but nonetheless equally Western ideologies, which they each attempted to impose on the rest of the world.

This, in turn, split the world into three camps:

- 1.those who supported capitalism and saw in Marxism, communism and socialism the anti-Christ which denied individual human rights and enslaved subjects to the state (The First World);
- 2.those who saw in capitalism the rapacious greed of a few, subjecting the many to work for their individual and private gain (The Second World);
- 3.and a third, '**non-aligned**' group, with many shadings, which sought to remain neutral, claiming to hold neither ideology, but some other political rationale suitable to their particular circumstances. It was in reference to this 'non-aligned' movement that the term 'Third World' first emerged.

Development Agencies, Human Rights and Structural Adjustment Programs 🇺🇸

📅 (04/08/16)

As new Third World nations emerged from the late 1940s onwards, confronted by enormous political and economic problems, the industrialized world became increasingly aware of the need to 'develop' 'undeveloped', 'under developed' and 'less developed' regions. It was strongly believed in 'Third World Development' circles, that, unless Third World communities were 'developed', they would fall prey to Soviet propaganda.

Over the next forty years, a wide range of national, international and voluntary 'development' organizations were established. Chief amongst these have been international organizations with charters which require them to fund and organize Third World development programs and plans.³²⁶

The World Bank and the International Monetary Fund (IMF) have had responsibility for advising governments on economic, welfare and development matters, for funding major projects, and for overseeing economic development in the new nations. In the process, they have widely been accused of imposing their own Western priorities and ideological interests on those governments most in need of assistance³²⁷.

Fantu Cheru discussed this:

In the words of former President Nyerere of Tanzania, the IMF has become 'the International Ministry of Finance', with enormous leverage to dictate the national policies of Third World governments ...

As in the case of IMF loans, the [World] Bank grants credit only after a borrower-government signs a letter of intent in which it undertakes to

comply with certain conditions. These conditions, however, go beyond the traditional IMF recipe and require major institutional reforms ...

The critics of the IMF and the World Bank charge that these institutions represent the interests of Western countries and that their orthodox prescriptions are not appropriate to the circumstances of African countries as they fail to address the root causes of underdevelopment and unequal exchange.

(Cheru 1989, pp. 35-6, 38-9)

The United Nations has provided a forum for interchanges between developed and developing countries. It has also often been accused of being a vehicle for the imposition of First World demands on Third World governments, including the imposition of sets of 'universal principles' relating to the rights of individuals and the responsibilities of governments.

Following the Second World War, with the ideological confrontation of capitalism and communism, Western nations became increasingly concerned with 'human rights', particularly with the right of individuals to freedom of movement and self-expression. No government should have the right to control movement. Of course, only 30 years earlier, [Western European colonial powers had no difficulty in imposing severe restrictions](#) on the movement of indigenous peoples within and from their colonies.

Not only were Third World governments pressured to implement such resolutions, the United Nations organizations formed to provide development assistance provided means of leverage to donor countries. Where First World governments disapproved of political processes and developments within the new nations, they very often used these international organizations as forums within which they could voice their concerns and through which they could pressure Third World governments for reform.

Accusations made against the activities of many of these organizations have been that the priorities which have been set, and the programs and projects which have been funded, have reflected First World rather than Third World concerns; and that these programs and the activities of international organizations have very often been motivated by 'human rights' issues which reflect the political concerns of First World nations.

The Indonesian Government, in 1993, spelt out its attitude to such First World pressures:

Human rights questions are essentially ethical and moral in nature. Hence, any approach to human rights questions which is not motivated by a sincere desire to protect these rights but by disguised political or, worse, to serve as a pretext to wage a political campaign against another country, cannot be justified ³²⁸.

Given the international tensions of the 'Cold War' period, it is small wonder that the international political concerns of donor nations strongly influenced their development priorities. This led them to use development funding as a means of pressuring governments into endorsing their interests and concerns.

Much of the pressure exerted on post-colonial governments during this period was concerned, not with the material well-being of Third World peoples so much as with ensuring the commitment of governments and people to the ideological biases of the donor nations.

With the demise of the Soviet Union, 'non-alignment' has become anachronistic. Now there is only one highly successful and very dominant ideology (with its variants) in the West, with socialism and communism in disrepute. Those who, in the past, sought to remain nonaligned, now have little option but to accept the ascendancy of capitalism and attempt to reorganize their communities to participate in the rapidly expanding international capitalist system.

Many of them, in the 1980s and 1990s, at World Bank and International Monetary Fund (IMF) instigation, implemented structural adjustment programs (SAPs) to reorient their political and economic organization and activity to neoliberal, free-market requirements. As Jason Oringer and Carol Welch (1998) claimed,

SAPs share a common objective: to move countries away from self-directed models of national development that focus on the domestic market and toward outward-looking development models that stress the importance of complete integration into the dominant global structures of trade, finance, and production. ³²⁹.

In the new international climate, no nation could escape involvement in the emerging global communications, financial, enterprise, information and entertainment networks. Nor could they insulate themselves from the deregulative forces which exposed populations to the vagaries of the international marketplace. These gave transnational corporations and organizations increasing influence within Third World national boundaries.

Confusing Third World intra-national tensions with international confrontations 🐼

 (26/04/17)

As colonial territories, faced with a daunting array of problems and difficulties bequeathed by their erstwhile 'masters', gained independence, they entered a world threatened by the confrontation of two world industrial powers, allied with those erstwhile 'masters' and armed with weapons of mass destruction.

No country was immune from the resulting tensions and from the demands made upon them to support or oppose the Western and Eastern blocs.

While there was no Third World War during this period, there were innumerable 'brush fires' or small wars.

Third World countries, fraught with internal tensions and challenges to central authority, became the target of Cold War rivalries. As regional interests in Third World nations challenged central governments they looked for external support and ways of obtaining weaponry and military expertise. They soon learned the language of international Cold War confrontation and used it very effectively in appealing for backing for their insurrections.

First, convince a Cold War bloc that they were committed to its ideological position. Second, convince them that their opponent was on the side of the opposing bloc. Once done, this would quickly be followed by funding for their activities by the major world players and their allies. This 'funding' was, of course, not 'free'. The costs of the wars were borne by the Third World countries, not by those international players who 'supported' them.

Inevitably, once one side in an internal Third World national conflict received international support of this kind, the other side found itself the recipient of

'military aid' from the opposing bloc. In this way, superpower tensions spilt over into the rest of the world, reclassifying local disputes in Cold War terms and financially crippling the Third World nations involved in the disputes.

During the Cold War period, these reclassified wars were fought in colonial and post-colonial countries, with opponents armed and supported by the two superpowers or their allies. Each conflict was recast as an ideological confrontation between capitalism and communism, proxies for direct conflict between First and Second World players (the superpowers and their allies were only directly involved in three of these wars). Only two of them (in Northern Ireland and Turkey) were not fought on Third World soil.

Because they were insulated from the conflict, this period of worldwide turmoil and bloodshed has often been described by people in Western nations as a prolonged period of peace. That peace has usually been attributed to the balanced build-up of nuclear weapons, which guaranteed the 'mutually assured destruction' (with the appropriate acronym 'MAD') of the two superpowers should they enter into war with each other.³³⁰

In Third World nations, however, during the second half of the 20th century, millions of people were killed in wars which were bankrolled and armed by the superpowers and their allies in the name of the ideological confrontation of capitalism and communism.³³¹

This was not a period when newly independent countries could concentrate on their 'development' equitably aided by 'developed' nations and development organizations whose interests in their affairs were wholly benign and positive. This was a period when countries which wished to receive 'aid' from the 'developed' 'First' (capitalist) or 'Second' (communist) worlds had to demonstrate their ideological commitment to the bloc which provided the aid.³³²

It was a period in which the bloc which did not provide the aid almost certainly attempted to develop and/or maintain festering discontent and rebellion within the country. The aim of this interference in the internal affairs of Third World countries was, through successfully fuelling insurrection, to replace the leadership with people committed to the ideology of the ideological bloc promoting the confrontation.

Throughout the Third World, governments, faced with the enormous task (inherited from colonial powers) of developing the infrastructures of 'modern' 'industrialized' countries, found themselves fighting 'insurgents' or 'rebels' or 'guerrilla movements', spending a great deal of their time, energy and resources on these conflicts.

Kick and Kiefer described the scene in the late 1980s:

In the last few years, developing countries have spent nearly [US] \$20 billion per annum on the importation of armaments ...

Militarisation of the Third World coincides with a marked post-war change in the global theatres of war from the developed to the developing countries. In the first half of this century major wars involved direct contention between the prevailing world powers, but since 1945 the structure of international warfare has shifted.

Sivard (1982) identifies 65 major wars and 10,700,000 civilian and battle deaths during 1960-1982, and with only two exceptions (Northern Ireland and Turkey) these wars were entirely fought on the territory of developing countries ...

The rivalry between the capitalist and eastern socialist power blocs has ... been played out in the Third World by the provision of military equipment to local combatants, and less often by direct intervention either by the sponsors themselves or by their proxies.
(Kick & Kiefer 1987, pp. 34, 44)

As Michael Renner described, 'more than \$1.2 trillion worth of military equipment has been transferred [to Third World countries] during the past three decades' (1994, p.23).³³³ It was small wonder that 'development' activities were less than successful, and that Third World governments, by the 1980s, faced bankruptcy and economic ruin.

Dan Connell spelt out some of the consequences:

In 1991, of the 25 largest Third World debtors, 12 were at war, and many were on a war footing ...

From 1970 to 1989, according to UN reports, Third World debt skyrocketed from \$68.4 billion to \$1,262.8 billion, leaving several nations owing more than they produce in annual income. Today, many countries have been forced to restructure their economies to keep up interest payments, while living standards plunge, urban squalor and rural poverty deepen, and infant and maternal mortality rates climb toward pre-independence levels.

With the best land reserved for export crops and natural resources sold off at discount rates, their ability to feed themselves declines further while environmental degradation proceeds apace. And more money is borrowed to stave off imminent catastrophe.
(Connell 1993, p. 1)

As [∞]Gustave Speth, Administrator of the United Nations Development Program, said of Africa in 1994(a):

We conveniently forget Africa's history. We forget that the transatlantic slave trade robbed Africa of about 12 million of its able-bodied men and women. We forget that colonialism which followed the slave trade introduced a system of exploitation of Africa's natural resources to feed the industries of the West.

We forget the 1884/1885 Colonial Conferences of Berlin which crudely Balkanised and divided Africa into geographic areas of control by the West, with scant regard for ethnic groupings. We even forget that during the period of the cold war's geopolitical fight for spheres of influence, Africa became a focal point for the ideology and the arms that today contribute to the havoc we find in Rwanda and Burundi, in Zaire and Angola and Somalia

... Conflict and wars claim resources that would otherwise be spent on education and health and housing and other areas of development.

... A large part of the blame for this trading in death rests with the industrial countries who, while giving aid in the order of \$60 billion a year, earn much more in arms sales and otherwise from the estimated \$125 billion per year in military expenditures of the developing world.
(Speth 1994(a))

At the very time when post-colonial governments were attempting to establish viable political and administrative institutions in their countries, legitimized by popular acceptance and participation, they were required to develop sophisticated international policies and interactions. They had to balance the geo-political demands of the superpowers with an increasing

range of 'development' requirements placed on them by an emerging set of international institutions. The conflicting and contradictory demands to which Third World governments were subjected made long-term, rational planning extremely difficult.

It's Unipolar or Multipolar Hegemony: Let's All Fight for 'Freedom' 🇺🇸

 (06/09/22) (09/09/22) (17/09/22) (23/09/22) (17/10/22) (24/10/22) (26/10/22) (28/10/22) (29/10/22) (08/11/22) (10/11/22) (11/11/22) (27/11/22) (01/12/22) (12/12/22) (20/03/23) (21/03/23) (27/03/23) (11/07/23) (13/07/23) (22/07/23) (07/03/24) (29/07/24)

'What has been will be again, what has been done will be done again; there is nothing new under the sun' ([Ⓔ][Ecclesiastes 1:9](#) (NIV))

An excellent discussion between Oksana Boyko and Talmiz Ahmad, India's former ambassador to Saudi Arabia insightfully sets the stage for this section. As Boyko sums up,

...One of the worst vestiges of colonialism is that nations start to believe the colonial narrative themselves.

I think in a sense what we've been discussing today is that many of those countries are finally ready to free themselves from all those narratives and to recognize that there's something inherently good and valuable and cherishable in their own history, their own national character and their own manifest destiny because all the nations of the world have something unique and something special to offer - if the international environment supports that...

(Oksana Boyko and Talmiz Ahmad, [Ⓔ][The Great New Deal? Talmiz Ahmad, India's Former Ambassador to Saudi Arabia, RT: Worlds Apart](#), 26 March, 2023)

Sergey Kurginyan, in a *Rossa Primavera* report (July 25, 2024), provided an alternative outcome in which a multipolar world results not in interdependent harmony but in a war of all against all, as nations compete for advantage in an unraveling unipolar world.

According to him, an ideal picture where everyone respects each other's interests, culture and identity can only cause tears of happiness. "But I think that everyone standing here realizes that nothing of this kind will happen," the analyst said, addressing the experts in the studio.

At the same time, Sergey Kurginyan noted that a multipolar world is inevitable due to the weakening of the United States and its "strange" policy.

"Under these conditions, the multipolar world becomes essentially a war of all against all," he said.

The political scientist emphasized that one should not expect a cold war similar to that between the USA and the USSR. He believes that it will be a war "quite different, between some two small African states," which will subsequently split into smaller conflicts.

"We are entering this world. But the only thing I would like to see is that this entry should not be accompanied by excessive hopes that we are approaching harmonization, and I believe that the Russian political leadership considers this exactly in this way,"

([Ⓔ][Kurginyan: Multipolar world will generate conflicts at the borders and on Russian territory, Rossa Primavera](#), July 25, 2024)

The multipolar reality will be shaped by the leaders of sovereign states in the emerging multipolar world. They can, if they so decide, create a world of scavengers: fighting over the spoils of a dying empire.

Or they can choose to enter into a multipolar world shaped by a new vision of humanity's future. A world of leaders who, at last, understand that humanity's future is in their hands and [can be shaped cooperatively, to the long-term benefit of all](#).

In 2022 the [first direct conflict](#) (between 'The West' (comprising those nations and their offspring which have over the past five centuries been involved in colonizing the rest of the world) and newly emerging 'peer' powers with the economic and military strength to directly challenge Western hegemony) had begun.

Western apologists and 'experts' were honing their rhetoric in anticipation of another propaganda driven 'Cold War' to suit a new century:

Russia, an aging tyranny, seeks to destroy Ukraine, a defiant democracy. A Ukrainian victory would confirm the principle of self-rule, allow the integration of Europe to proceed, and empower people of goodwill to return reinvigorated to other global challenges. A Russian victory, by contrast, would extend genocidal policies in Ukraine, subordinate Europeans, and render any vision of a geopolitical European Union obsolete.

Should Russia continue its illegal blockade of the Black Sea, it could starve Africans and Asians, who depend on Ukrainian grain, precipitating a durable international crisis that will make it all but impossible to deal with common threats such as climate change.

A Russian victory would strengthen fascists and other tyrants, as well as nihilists who see politics as nothing more than a spectacle designed by oligarchs to distract ordinary citizens from the destruction of the world. This war, in other words, is about establishing principles for the twenty-first century. It is about policies of mass death and about the meaning of life in politics. It is about the possibility of a democratic future....

How good it must feel to have a new, endlessly giving, cold war on which to pontificate:

At the St. Petersburg International Economic Forum in June 2022, Margarita Simonyan, editor in chief of the state-run network RT, said that "all of our hope lies in famine." As the skilled propagandist understands, the point of starving Africans and Asians is to create a backdrop for propaganda. As they begin to die, Ukrainians will be scapegoated.

(Timothy Snyder, [Ukraine Holds the Future: The War Between Democracy and Nihilism](#), *Foreign Affairs*, September/October 2022)

Yes, this is rabid nonsense, but expect more and more of such rhetoric as the confrontation 'matures'!

'The West', with the United States leading the way and directing the policies and 'responsibilities' of Western Europe and its other 'allies', is playing a dangerous game. It seems that it has decided on a 'winner take all' strategy in its war to retain unipolar hegemony.

Obscured by the propaganda (smoke screen for far more serious warmongering), the West is more and more openly arming, training and funding both Ukrainians and mercenaries and steadily escalating the nature of supplied weaponry (this is how it 'managed' its wars in post-colonial nations during the first 'Cold War' - but none of them were nuclear armed peer nations!).

Russian foreign minister Lavrov described the reality:³³⁴

Neither Russia nor China (nor any other nation which becomes a target of US warmongering) has any real alternative: The West, as it has throughout its colonial and neo-colonial past, will brook no competitors. As Awolowo described, those who challenge it are faced with a 'choice of one of two roads leading to subjection: defeat or surrender'.

If there can be no alternative, for Russia, to achieving the aims of its 'Special Military Operation' in Ukraine, there can, equally, in the minds of the Washington establishment, be no alternative to preventing Russia from doing so.³³⁵

As in [Afghanistan, over more than four decades](#), so in Ukraine, The United States will pursue its objective of weakening and finally dismembering Russia [no matter the cost to those being used as proxies](#). Neither Ukraine nor NATO (and by default, all those nations which have wagered their futures on its ambitions) are anything more than means to Washington's ends. And those ends assume the complete subordination of all other actors to Washington's ambitions.³³⁶

Samarajiva put it well (if somewhat hyperbolically):

Nobody deserves it more, but you have to feel bad for Europeans. They're colonized by America and they don't even know it. Europeans are told to blame Russia, China, immigrants and to love the Americans actually fleecing them. America is literally occupying, bombing, and deindustrializing Europe, and taxing the suckers 2% for the privilege. America bombs pipelines in Germany to sell the fools more expensive American gas. America sends Europe's weapons to Ukraine, then forces the Europeans to [buy even more expensive replacements](#). America doesn't protect Europe, it's a protection racket. Europeans are bad people, but you have to feel bad for them. After sucking the world dry for hundreds of years, they're now just the world's biggest suckers.... (Indrajit Samarajiva, ^œ[America Has Defeated Europe](#), *indi.ca*, March 05, 2024)

Sarotte described the way in which 'NATO Membership' has been employed to keep suppliant nations compliant with the foreign policy objectives of the 'NATO Alliance':³³⁷

Confident of the power of 'favors to come' in keeping NATO aspirants loyal no matter what the costs might be, on July 8, 2023 the United States president ^œ[Biden said he decided to send Ukraine controversial cluster bombs because Kyiv is 'running out of ammunition'](#).

For Ukraine, the 'war' with Russia is about 'liberating' its eastern regions from Russian occupation yet, in order to retain Washington's approval, it is apparently prepared to scatter unexploded cluster bombs (which might well ^œ[remain active for decades](#) around those territories) and, of course, it earlier ^œ[accepted 'depleted uranium' shells](#) for use in those regions.

With Ukraine converted into a fully compliant vassal state, the United States and NATO command can plan ahead. Paul McLeary explained:³³⁸

At a much-hyped two-day NATO 'summit' in Vilnius, Lithuania (July 11-12, 2023), Ukraine found itself still chasing the 'NATO Carrot'. As an *Associated Press* report explained:

Ukrainian President Volodymyr Zelenskyy welcomed fresh pledges of weapons and ammunition to fight Russia's invasion along with longer-

term security commitments from the West on Wednesday even as he expressed disappointment over the lack of a clear path for his country to join NATO as the alliance wrapped up its annual summit.

"The Ukrainian delegation is bringing home a significant security victory for the Ukraine, for our country, for our people, for our children," he said while flanked by U.S. President Joe Biden and other leaders from the Group of Seven most powerful democratic nations. (Chris Megerian, Lorne Cook and Seung Min Kim, ["Ukraine wins G7 security pledges but NATO membership remains elusive"](#), ABC News, July 12, 2023)

A TASS report summed it up:

The price of security guarantees from the Group of Seven (G7) is a Ukraine cleared of Ukrainians by Western weapons, Russian Foreign Ministry Spokeswoman Maria Zakharova said on Wednesday.

Earlier, Ukrainian Defense Minister Alexey Reznikov expressed concern over the G7's security guarantees, saying that "Kiev will not believe in them until it finds out what their price is."

"The price is not a secret: a Ukraine cleared of Ukrainians by Western weapons but with enough population left to serve NATO troops. There is no need to deport anyone to Western Europe any more because people have moved there themselves," the diplomat wrote on Telegram.

(["Ukraine to pay high price for security guarantees from G7, Russian diplomat says"](#): "The price is not a secret: a Ukraine cleared of Ukrainians by Western weapons but with enough population left to serve NATO troops," Maria Zakharova stressed, TASS, July 13, 2023)

With the Northern Hemisphere sweltering under record breaking heat and ["enduring a 'weird, wild summer'"](#) which 'has brought one extreme event after another - from heat waves to wildfires and floods', human beings, focused on their military ambitions, challenges and fears, continue to ignore reality:

Russian President Vladimir Putin pointed to the Ukrainian army's huge losses, depleted Western arsenals and a change in public mood in Ukraine and Europe as the consequences of Kiev's much-trumpeted counteroffensive that yielded no results.

"It is obvious today that the Kiev regime's Western handlers are clearly disappointed over the results of the so-called counteroffensive loudly trumpeted by the current Ukrainian authorities in the previous months," Putin told a meeting with permanent members of the country's Security Council.

"There are no results [of Ukraine's counteroffensive], at least for the time being. Neither huge resources pumped into the Kiev regime nor the deliveries of Western weapons - tanks, artillery, armor and missiles - nor thousands of foreign mercenaries sent there and most actively used in attempts to break through our army's front are of any help," the Russian leader said....

As Putin pointed out, "the endless prolongation of the Ukraine conflict is also advantageous" for the United States.

"Judging from what is happening in real life, the current US ruling elites are doing precisely this. In any case, they are acting following this logic," the Russian leader said.

"Whether this policy corresponds to the true and vital interests of the American people is a big question and certainly a rhetorical question and let them deal with it themselves," the head of state said.

"However, the flames of war are being intensely fueled at present," Putin said. The Russian leader pointed out that the United States "exploits for this purpose the ambitions of leaders of some Eastern European states who have long turned their hatred of Russia and Russophobia into their chief export commodity and an instrument of their internal policy and now want to benefit from the Ukrainian tragedy."

(Military Operation in Ukraine, [∞][Putin points to Kiev's huge losses, depleted Western arsenals in failed counteroffensive](#), TASS, July 22, 2023)

Ignoring the wild weather in the Northern Hemisphere with recent extremes 'off the charts', if the United States has its way, the world will be embroiled in an interminable Europe-based 'war', stretching through several decades of this century.

Its ambition: exhausting Russia's ability to oppose its will, with Russia and (unfortunate though this might be) Western Europe and Ukraine suffering the fate of so many of the United States' conflict proxies around the world.

The stage has been set for [an attempt by those opposed](#) to the increasingly irrational unipolar United States based hegemony to establish a new multipolar world. In the interests of gaining support from all those nations not already committed to one or the other; emissaries of both sides are lobbying them for commitment to their vision for the future of the world.

Nanjala Nyabola has explained:³³⁹

In 2022, post-colonial nations, around the world, were once again being co-opted, this time in support of the ideologically driven interests of Western nations and of emergent powers determined to thwart those interests and free the 'Rest of The World' to independent self-development.

But, of course, ['The West' will not go quietly](#). It has dominated and exploited the rest of the world for more than 500 years and it sees no reason why that dominance should not persist into the indefinite future.

After all, but for 'The West' the rest would still be ignorant barbarians, living from hand to mouth [in a primordial jungle](#) because, as [Samuel Smiles explained](#) in 1859,

Any class of men that lives from hand to mouth will ever be an inferior class. They will necessarily remain impotent and helpless, hanging on to the skirts of society, the sport of times and seasons. Having no respect for themselves, they will fail in securing the respect of others. In commercial crises, such men must inevitably "go to the wall." Wanting that husband power which a store of savings, no matter how small, invariably gives them, they will be at every man's mercy, and, if possessed of right feelings, they cannot but regard with fear and trembling the future possible fate of their wives and children.

"The world," once said Mr. Cobden to the working men of Huddersfield, has always been divided into two classes - those who have saved, and those who have spent - the thrifty and the extravagant.

The building of all the houses, the mills, the bridges, and the ships, and the accomplishment of all other great works which have rendered

man civilized and happy, has been done by the savers, the thrifty; and those who have wasted their resources have always been their slaves.

It has been the law of nature and of Providence that this should be so; and I were an imposter if I promised any class that they would advance themselves if they were improvident, thoughtless, and idle.

While The West has, since WW2, learned discretion in showing how they really view those in 'developing' countries, many still consider them simple folks, easily misled by those who would exploit them and lead them astray. The West, having demonstrated to them the wonderful advantages of the March of Compound Interest and brought them "progress" and "civilization", still has that responsibility which they accepted long ago: to complete their mission, to [bring them into the light of civilization](#) and protect them from the unscrupulous.

In 2023 (the 20th anniversary of the West's invasion of Iraq) they believed they had found a way not only to discredit those leading the movement to establish a new multipolar world but also to bring Vladimir Putin and his henchmen to justice for 'crimes' committed in Ukraine:

[On] 17 March 2023, Pre-Trial Chamber II of the International Criminal Court ("ICC" or "the Court") issued warrants of arrest for two individuals in the context of the situation in Ukraine: Mr Vladimir Vladimirovich Putin and Ms Maria Alekseyevna Lvova-Belova.

Mr Vladimir Vladimirovich Putin, born on 7 October 1952, President of the Russian Federation, is allegedly responsible for the war crime of unlawful deportation of population (children) and that of unlawful transfer of population (children) from occupied areas of Ukraine to the Russian Federation (under articles 8(2)(a)(vii) and 8(2)(b)(viii) of the Rome Statute). The crimes were allegedly committed in Ukrainian occupied territory at least from 24 February 2022. There are reasonable grounds to believe that Mr Putin bears individual criminal responsibility for the aforementioned crimes, (i) for having committed the acts directly, jointly with others and/or through others (article 25(3)(a) of the Rome Statute), and (ii) for his failure to exercise control properly over civilian and military subordinates who committed the acts, or allowed for their commission, and who were under his effective authority and control, pursuant to superior responsibility (article 28(b) of the Rome Statute).

(Press Release, [Situation in Ukraine: ICC judges issue arrest warrants against Vladimir Vladimirovich Putin and Maria Alekseyevna Lvova-Belova](#), *International Criminal Court*, 17 March 2023)

The Neoliberal West has made an artform out of [repurposing international institutions](#) to serve their own needs. The ICC is 'influenced' to issue warrants for the arrest of those who have fallen out of favor with Western governments and influential Western organizations.

As in this case, very often no specific charges are laid, and, as also in this case, the charges are directed at individuals and organizations in nations which are neither members of the court nor under its jurisdiction.

Despite internationally recognized egregious war crimes committed by the United States and its 'Coalition of the Willing' in Iraq, not a single individual or organization has been subjected to ICC warrants!

Russian Foreign Ministry spokeswoman Maria Zakharova summed it up:

The decisions of the International Criminal Court have no meaning for our country, including from a legal point of view... Russia is not a party to the Rome Statute of the International Criminal Court and bears no obligations under it.

It really is past time that the hegemonic imposition of Western interests on the rest of the world was countered by enabling excluded nations' involvement in international governance power structures.

Mo Ibrahim has explained the problem for 'Africa':

Today, Africa still exists at the margins of the global order, largely excluded from international institutions and treated as a basket case to be fixed. The current multilateral system, created at the end of World War II, does not effectively represent or serve the present world. Almost everyone agrees with this assessment, but the international community keeps kicking the can down the road. A fresh look at the mission and the governance of institutions such as the United Nations, the World Bank, and the International Monetary Fund is overdue.

Take the UN Security Council, which has been rendered impotent by the veto powers of its five permanent members: China, France, Russia, the United Kingdom, and the United States. None of these countries is keen to give up its unfair privileges, even if that means crippling a vital institution. All can act with impunity and offer protection to their client states, allowing atrocities to go unpunished and shielding dictators in Africa and elsewhere from scrutiny. This state of global governance is unacceptable.

The G-7 and G-20 groups of major economies are also failing Africa. Understandably, no African countries are members of the former and just one, South Africa, is included in the latter. But unlike the European Union, the African Union does not get a seat at either table. It is occasionally invited to dinner but never into the meeting room. This treatment has enormous consequences for Africa, which has little say in the setting of international standards that affect everything from fighting corruption to financing development to mitigating the effects of climate change. Debates and decisions on these and other issues would be fairer and more efficient if the G-7 and G-20 didn't simply dictate to Africa but treated it as an equal partner.

Africans have been asking for more cooperation from the West as they seek to battle corruption. After all, funds stolen from the continent nearly always end up in Western banks. North American and European countries need to establish public registries that identify those who own or benefit from secretive, anonymous companies. Yet they have resisted doing so, despite regularly haranguing Africans about corruption....

(Mo Ibrahim, ^{oe}[Africa's Past Is Not Its Future: How the Continent Can Chart Its Own Course](#), *Foreign Affairs*, November 10, 2022)

The problem for nations excluded from key international fora is that most of those fora are focused on, as Ibrahim put it, 'major economies' concerns and so most African (and many other) nations fail to qualify for membership, being 'occasionally invited to dinner but never into the meeting room'.

Attempting to include marginalized nations in those 'major economy' fora will not make them any less marginalized.

A *Global Times* editorial illustrates this problem:

China has expressed its support to include the AU [African Union] in the G20, a mechanism proven effective in global governance, because it is willing to increase Africa's influence in the international arena. Beijing is also willing to work with more African countries to push for more equality and inclusiveness in multilateral frameworks, such as the G20.

Even though Washington will also voice its support for AU membership in the G20 as Beijing has done, the logic behind it is entirely different: While the latter emphasizes cooperation and achieving win-win results with Africa, the former still highlights competition and confrontation, particularly with China, on the continent.

(Editorial, ^œ[US' support for AU joining G20 empty pledge aimed at hindering China](#), *Global Times*, December 11, 2022)

Excluded nations whose inclusion in major fora is 'supported' by 'major economies' will remain marginalized even if they are granted 'right to attend privileges'. It is time to move to more relevant foci, requiring 'major economies' to accept that their classification as 'major economies' is largely a consequence of exploiting both resources and peoples around the world.

The world is facing burgeoning environmental problems stemming directly from the activities of those 'major economies'. It is time for nations to focus on means of fast-reducing the negative impacts of 'major economy' activities. Those 'major economy' nations should be made directly accountable to all nations impacted by their activities and major world fora should be focused on that concern.

If 'African' (and any other regional) peoples are to be 'freed' to unhindered self-development and empowered within the wider world, there is a need for a multipolar reality in which military and economic power are not seen as virtues but as threats to the wellbeing of humanity. The rights and responsibilities of those empowered regional groupings of nations in monitoring and limiting the activities of the powerful should be the prime focus of 'international fora'.

The focus of major fora must be on holding 'major economies' accountable for the damage they are doing - and that accounting should be to major regional groupings of nations impacted by their activities.

It's time for a New World Order 🇺🇸

 (02/04/23) (16/04/23) (30/05/23) (12/06/23) (17/06/23) (04/07/23) (06/07/23) (30/07/23) (02/08/23) (01/10/23) (03/10/23) (07/10/23) (20/02/24) (19/03/24) (30/03/24) (09/04/24) (12/04/24) (24/04/24) (02/05/24) (18/05/24) (25/05/24) (01/06/24)

In the face of [horrendous atrocities perpetrated by Israel](#), reminiscent of long-whitewashed atrocities by colonizing Western nations in preceding centuries, US politicians with [some vestige of non-sociopathic empathy](#) for the plight of those on the receiving end of it all are speaking out.

This is far too little and far too late, but at least politicians like Bernie Sanders are beginning to realize that the genocidal behavior of Israel is unacceptable.

As Sanders has put it,

A sad fact about the politics of Washington is that some of the most important issues facing the United States and the world are rarely debated in a serious manner. Nowhere is that more true than in the area of foreign policy. For many decades, there has been a "bipartisan consensus" on foreign affairs. Tragically, that consensus has almost always been wrong. Whether it has been the wars in Vietnam, Afghanistan, and Iraq, the overthrow of democratic governments throughout the world, or disastrous moves on trade, such as entering the North American Free Trade Agreement and establishing permanent normal trade relations with China, the results have often damaged the United States' standing in the world, undermined the country's professed values, and been disastrous for the American working class.

It has taken him a long time to admit that Israel

...is waging a campaign of total war and destruction against the Palestinian people, resulting in the deaths of tens of thousands - including thousands of children - and the starvation of hundreds of thousands more in the Gaza Strip.^{[340](#)}

Accepting United States' complicity in it all, Sanders tells us all that 'A Revolution in American Foreign Policy: replacing Greed, Militarism, and Hypocrisy With Solidarity, Diplomacy, and Human Rights' is overdue.

It is time for the 'rest of the world' to closely scrutinize Western performance in terms similar to those the West has used as justification for interfering in the internal affairs of non-Western nations and communities.

'The State Council Information Office of the People's Republic of China on Wednesday [May 29, 2024] released a report on human rights violations in the United States in 2023 ^{[341](#)}.

As their summary of the report's findings says:

The human rights situation in the United States continued to deteriorate in 2023. In the United States, human rights are becoming increasingly polarized. While a ruling minority holds political, economic, and social dominance, the majority of ordinary people are increasingly marginalized, with their basic rights and freedoms being disregarded....

Bernie Sanders' concern for the state of American Foreign Policy in this third decade of the 21st Century needs to be matched by similar concern for the human rights profile within the nation itself. [The United States of America](#)

is, indeed, unravelling, both as an international hegemon and as a coherent democracy.

A Scottish aphorism sums up the likelihood of any real change in United States foreign or domestic policy this century:

If wishes were horses, beggars would ride!

With [privatization and corporatization](#) driving United States' domestic and foreign policies, there is little hope of any meaningful change happening in this century. The best the rest of the world can hope for is that, with the center of Western Capitalism, in this century, [heading toward a chaotic, dystopic future](#), it will refrain from futile attempts at imposing half-baked 'regime change' on others.

We begin this topic with the way in which Western privatization 'experts' set about privatizing the Russian Federation in the 1990s. It was a project that, as Janine Wedel described, was [true to the spirit of Western Colonialism](#).

'The West' has appropriated and 'privatized' resources around the world over more than 500 years and obfuscated their activity by telling the 'natives' that they were 'developing' them. Similarly, the economic 'reform' (i.e. 'development') of Russia was focused on appropriating and 'privatizing' the resources of the Russian Federation, securing them in the ['asset portfolios' of the 'super-rich'](#) ³⁴².

After seven years of economic "reform" financed by billions of dollars in U.S. and other Western aid, subsidized loans and rescheduled debt, the majority of Russian people find themselves worse off economically.

The privatization drive that was supposed to reap the fruits of the free market instead helped to create a system of tycoon capitalism run for the benefit of a corrupt political oligarchy that has appropriated hundreds of millions of dollars of Western aid and plundered Russia's wealth.

(Janine R. Wedel, ^œ[The Harvard Boys Do Russia: After seven years of economic "reform" financed by billions of dollars in U.S.](#), *The Nation*, May 14, 1998)

Adrian Campbell spelt out the 1990s consequences for Russian peoples:

Massive economic dislocation occurred as Soviet economic ties were severed, a market economy was created and shock therapy accompanied by mass privatisation.

The social impact was immense. Life expectancy fell, with up to five million excess adult deaths in Russia in 1991-2001, birth rates collapsed and both of these trends were compounded by widespread crime and trafficking. These negative effects were concentrated in periods of economic crisis in 1991-94 and 1998-99.

Sharply rising inequality and the emergence of a new wealthy class, including some leading reformers, meant that the term "democrat" had become a term of abuse as early as 1992.

(Adrian Campbell, ^œ[The wild decade: how the 1990s laid the foundations for Vladimir Putin's Russia](#), *The Mandarin*, July 03, 2020)

It is time for a new world order:

A world in which sovereign 'nations' and their varied peoples are able to forge their own futures, informed by their own historically forged 'realities'. ³⁴³

A world in which the strong accept their interdependent responsibility for guaranteeing the weak the freedom needed to be themselves, not a distorted and dysfunctional version of the realities of the strong.

A world in which all nations and governments respect and accept reciprocal responsibility for ensuring the unmolested freedom of others to be themselves!

One can but hope that, this time round, existing and 'would-be' leaders of post-colonial nations will not succumb to the temptation to indulge in weapons purchases and alignment with those intent on exploiting their peoples and environments! It's time for the world to focus on the [looming disasters](#) awaiting it, not engage in fruitless wars and self-destructive antagonisms.

How desperately we need the wisdom of the non-aligned!³⁴⁴

Unity in diversity is used as an expression of harmony and unity between dissimilar individuals or groups³⁴⁵.

In a speech at Colombo, Sri Lanka, in 1953, India's first defence minister V K Menon laid down five principles that would be the cornerstone of Non-Aligned Movement policy.

1. Mutual respect for each other's territorial integrity and sovereignty
2. Mutual non-aggression
3. Mutual non-interference in domestic affairs
4. Equality and mutual benefit
5. Peaceful co-existence

Post-colonial India has used the concept of 'unity in diversity' as means of justifying the unity (at the national level) of diverse regions with their own historical backgrounds.

Zhang Lihua, in a 2013 explanation of the Chinese understanding of 'Unity in Diversity': '[Harmony without Uniformity](#)', put it like this:

According to the concept of harmony, the universe unites diversity...There are many examples in which differences complement each other in nature and society. Uniting diversity is the basis for the generation of new things.

Confucius said, "The gentleman aims at harmony, and not at uniformity..." Thus, a gentleman may hold different views, but he does not blindly follow others. Instead, he seeks to coexist harmoniously with them.

(Zhang Lihua, [China's Traditional Cultural Values and National Identity](#), *Window into China*, Carnegie Endowment for International Peace, November 21, 2013)³⁴⁶

Between nations, as between individuals, in a multipolar world of 'sovereign equals', Confucius' observation must be central.

To paraphrase Confucius: In a multipolar world of sovereign equals, harmony can only be achieved in participating nations which see themselves as fundamentally unified, sharing a present and a future founded on a true recognition of their individual and collective responsibility for ensuring humanity's indivisible unity.

Sovereign nations will hold different understandings of the world, different ambitions within that world and truly unique histories, but they must, nonetheless, determinedly strive for harmony, neither blindly following others nor insisting that others follow them. Instead, focused on harmony, they will seek to coexist harmoniously with each other.

A *Global Times* editorial entitled 'Modi's remarks on China-India relations are thought-provoking', describes India's astute balancing of relations between three major nations³⁴⁷:

Between nations, as between individuals, in a multipolar world of sovereign equals, each must aim at harmony, and not at uniformity. They may hold different views, but they do not blindly follow others. Instead, they seek to coexist harmoniously with them - while remaining true to their own historically forged understandings, attitudes and interests.

Over the past 70 years (and arguably for much longer than that) the term 'democracy' has been steadily degraded. It no longer means the *consensus* rule of 'the majority' in an [interdependent world of reciprocal responsibility](#).

In a zero-sum world of independent individuals focused on self-gratification, it has become the rule of the strong over the weak; of the rich over the poor; of those who control the 'media' over those with no voice. In the process, democracy, as the cooperative interdependence of diverse groupings (summed up as 'unity in diversity'), has lost all relevance.

The exercise of 'authority' has been displaced by the exercise of 'power'. Those who gain 'power' (whether through the 'ballot box' or through 'major economy' status) use that power to enhance and further promote their own independent self-interest in a 'devil take the hindmost' world of unregulated self-promotion.

[Sovereignty requires independent control of currency creation and unravelling of colonial resource privatization](#) 🐦

 (09/07/24) (15/01/25)

The world is changing and the hegemonic domination of 'major economies' is unravelling,

[To repeat oneself](#); we are, hopefully, emerging into a multipolar reality in which sovereign 'nations' and their varied peoples are able to forge their own futures, informed by their own historically forged 'realities'; a world in which the strong accept their interdependent responsibility for guaranteeing the weak the freedom needed to be themselves, not a distorted and dysfunctional version of the realities of the strong; a world in which all nations and governments respect and accept reciprocal responsibility for ensuring the unmolested freedom of others to be themselves!

In any sovereign capitalist country, [whoever controls the purse strings controls the nation](#)!

No nation which surrenders control of credit creation and management is truly sovereign.

[It should be a world of sovereign 'equals'](#); empowered to realize the possibilities of their own financial sovereignty. A world of nations able to fully realize the [advantages of their separate sovereign national banks](#), able to [engage in bilateral credit swap agreements](#) with other nations based on

respect for each others' right to create and manage their own national currencies and sovereign bank accounts.

The inter-national use of national currencies, in 2023, is gathering momentum. A TASS report explained:³⁴⁸

Bilateral credit swaps and the use of national currencies in settling cross-border financial transactions should become 'normal' practice. And, equally, [national governments should learn and exercise the advantages \(and responsibilities\) of using their own fiat currencies](#) in funding their internal financial 'needs'.

The powers of international organizations such as the World Bank and International Monetary Fund should be severely curtailed and redefined in support of such developments. If that is not possible, they should be dissolved as anachronistic institutions with all debts owed by debtor nations cancelled in the process. Those debts have, over many years, been used to usurp the financial sovereignty of nations which received their 'help'. It is time to wipe the slate clean and start afresh, [based on sovereign financial independence](#).

The world does not need - and should not tolerate - the existence of a hegemonically controlled 'super currency' to which trading nations must be granted access in order to trade.

Regional 'currency unions' (originally established as means of both 'overseeing' and legitimizing post-colonial regional currencies in the 1940s to 70s), tied to, and 'legitimized' (in various ways) by Western monetary authorities, face similar dangers of forfeiting financial sovereignty to those Western monetary authorities³⁴⁹.

Monetary unions such as the Eurozone impose monetary policies on participating national governments and so distort national financial controls. Matthieu Bordenave, in an essay entitled 'Should we cancel national debt owned by the ECB ?', has described the resulting 'national deficit' problems of participating nations:

For over a decade, the European Central Bank has implemented unconventional monetary measures known as "Quantitative Easing" in response to the 2008 crisis, the euro crisis, and the Covid-19 crisis. These measures were necessary to prevent an economic collapse and a new crisis of public debt in Europe. However, now the member states must repay significant amounts to their respective central bank.

There are only two options for re- paying public debt: either by borrowing the same amount again (by rolling over the stock of debt) or by achieving a budget surplus that allows for repayment without additional borrowing. In other words, they either become increasingly dependent on financial markets or implement austerity measures.

Another possibility is to rely on either economic growth or inflation, but this would require substantial investments and wage increases, which in turn means borrowing more in order to spend more. Attempting to separate growth from debt, as desired by Bruno Le Maire , is like trying to fill a bathtub without turning on the tap (Giraud et al.).

(Matthieu Bordenave, ^{oe}[Should we cancel national debt owned by the ECB ?](#), *Committee for the Abolition of Illegitimate Debt*, October 03, 2023)

Sean Hagan and Hugh Bredenkamp, in a 2018 IMF Blog posting, provide an introduction to existing currency unions and address some of the potential

sovereignty problems associated with membership of such unions. As they say:

There are currently four currency unions in the world - the Central African Economic and Monetary Community, the Eastern Caribbean Currency Union, the European Monetary Union, and the West African Economic and Monetary Union - all of which delegate monetary policy and, to varying degrees, exchange rate and financial sector policies to union-level institutions.

Currency unions have long been part of the global financial landscape, but they now account for over 15 percent of the global economy. In the absence of established guidance, our engagement with currency union institutions during past programs has been somewhat ad hoc. By clarifying how adjustment programs should be designed in the future, we hope to foster more robust programs and promote more evenhanded treatment....

(Sean Hagan and Hugh Bredenkamp, [∞][Monetary unions A Framework for Currency Unions and IMF Lending](#), *IMF Blog*, March 16, 2018)

In a 'post-colonial' world finally breaking the shackles of Western hegemonic manipulation of post-colonial financial and economic sovereignty, currency unions can remain a perennial threat to the truly sovereign independence of participating nations. Those nations involved in such unions need to carefully weigh the costs and benefits of participation if they are to rid themselves of the last vestiges of colonialism.

Yes, this is a utopian future and reality is never utopian - but, unless we dream of such a reality and aspire to it, we will end up in another version of the dystopian world of unregulated capitalism.

Where there is no vision the people perish.

The Euro-centric 'world order' which has dominated the world over the past several centuries has had, and continues to have, a number of distinct and peculiar features which underpin and drive Western dominance.

First and foremost is the militarily backed search for and appropriation of 'useful' resources to feed Western capitalist development.

This has taken the form of [privately controlled but publicly legitimized forms](#) of colonialism, with the rest of the world required to accept and live within a Westernized political, legal, financial and economic reorganization of their lives and societies.

Throughout the world, 'development' has meant Westernization. Indigenous understandings of the world and concomitant social, political and economic processes and forms have been 'superseded'; declared to be 'anachronous' and 'backward' ways of life which must, inevitably, be displaced by those required in any truly 'developed' society.

The world of the 21st century must be 'Western' or remain 'undeveloped'.

If there is to be a 'new world order', it is presumed that, inevitably, it will be Western in form and focus. And, of course, given that the world has indeed been reorganized into Western style 'nation-states', legitimized by Western style 'boundaries', public institutions and forms of resource and commodity ownership and exploitation, that presumption is indeed 'reasonable'!

Those determined to live in a world which reflects the [real diversity of 'realities'](#), politics and social structures of peoples around the world, have

embarked upon a Sisyphean enterprise.

But, they have made a good beginning!

The emerging and embryonic *Shanghai Cooperation Organization*³⁵⁰ has, indeed, declared itself to be an organization dedicated to asserting and supporting the true sovereignty of each member state.

Each state is presumed to have the right to 'develop' as an independent yet interdependent entity with the right to determine its own nature and destiny within an umbrella of nations with similar intent. Within that framework, states will support each other in developing both internal and inter-nation infrastructures and inter-governmental support processes.

The vision, while necessarily non-directive and embryonic, is a bold and imaginative one. If there is indeed a benign supra-human intelligence upon which we can all rely, one can but hope that it will impart true wisdom and foresight to those shaping this new beginning for humanity. We can but pray that it will not be derailed by either the inevitable Western militarized reaction or the looming environmental crises facing humanity.

The Russian President, Vladimir Putin, explained Russia's position³⁵¹ on all this:

The world is entering a decade of tumult as the pursuit of a more just world order clashes with the arbitrary hegemony of [the collective West](#), Russian President Vladimir Putin said on Thursday, addressing the annual meeting of the Valdai Discussion Club.

Putin's speech ranged from biodiversity to "cancel culture," the nature of what the West has to offer and Russia's response, followed by hours of answering audience questions....

In a truly democratic multipolar world, any society, culture and civilization should have the right to choose its own path and socio-political system. If the US and Europe have that right, so should everyone else. Russia also has it, *"and no one will ever be able to dictate to our people what kind of society we should build and on what principles."*

"Above all, we believe that the new world order should be based on law and justice, be free, authentic and fair," the Russian president said.

"The future world order is being formed before our eyes. And in this world order, we must listen to everyone, take into account every point of view, every nation, society, culture, every system of worldviews, ideas and religious beliefs, without imposing a single truth on anyone, and only on this basis, understanding our responsibility for the fate of our peoples and the planet, to build a symphony of human civilization."

(Vladimir Putin, ^œ[No one can sit out the coming storm': Putin's milestone Valdai speech](#), RT, 27 October, 2022)

(English transcript of Putin's speech: ^œ[Meeting of the Valdai International Discussion Club](#), Office of the President of Russia, October 27, 2022)

And, in a joint declaration encompassing these and a range of related issues, Presidents Xi and Putin, on May 6th 2024, issued a ^œ[Joint Statement by the Russian Federation and the People's Republic of China on Deepening Relations of Comprehensive Partnership and Strategic Cooperation, Entering a New Era in the Context of the 75th Anniversary of the Establishment of Diplomatic Relations between the Two Countries'](#).

A lot has happened in two years and in this statement they have summed up not only what has happened but also the firm intent of both nations to ensure the establishment of 'a truly democratic multipolar world, [in which] any society, culture and civilization [will] have the right to choose its own path and socio-political system' with the full support of all other nations intent on living in this new multipolar world of truly independent nations bound together in an interdependent world of sovereign equals.

In 2024, Elizabeth Economy, in an alert to the Western World, warned her readers of the 'danger' of such 'brash, self-congratulatory proclamations' as those being made by Russia's President Putin and China's 'confrontational "Wolf Warrior" style of diplomacy':

By now, Chinese President Xi Jinping's ambition to remake the world is undeniable. He wants to dissolve Washington's network of alliances and purge what he dismisses as "Western" values from international bodies. He wants to knock the U.S. dollar off its pedestal and eliminate Washington's chokehold over critical technology. In his new multipolar order, global institutions and norms will be underpinned by Chinese notions of common security and economic development, Chinese values of state-determined political rights, and Chinese technology. China will no longer have to fight for leadership. Its centrality will be guaranteed.

To hear Xi tell it, this world is within reach. At the Central Conference on Work Relating to Foreign Affairs last December, he boasted that Beijing was (in the words of a government press release) a "confident, self-reliant, open and inclusive major country," one that had created the world's "largest platform for international cooperation" and led the way in "reforming the international system." He asserted that his conception for the global order - a "community with a shared future for mankind" - had evolved from a "Chinese initiative" to an "international consensus," to be realized through the implementation of four Chinese programs: the Belt and Road Initiative, the Global Development Initiative, the Global Security Initiative, and the Global Civilization Initiative.

(Elizabeth Economy, [China's Alternative Order: And What America Should Learn From It](#), *Foreign Affairs*, April 23, 2024)

For all those Western 'experts' and commentators, willing and able to hear and understand, [Confucius explained](#):

The gentleman aims at harmony, and not at uniformity...

Individuals, communities and peoples, holding different understandings of the world and different ways of interacting with one another, should not blindly follow others. Instead, they should seek to coexist harmoniously with them.

Humanity is still evolving, and will continue to do so for as long as it survives as a species. And, that evolution, if humanity is to escape the consequences of its darker urges, must be toward a species-wide empathic harmony of interdependent communities and peoples.

What Elizabeth Economy describes as 'a long-term competition' between a 'community with a shared future for mankind', and the 'system the United States supports' is a consequence of fundamentally different understandings of 'reality' held by an individualistic West and an interdependently organized world which has, over many years, been subjected to Western invasion, exploitation and reorganization.

Let's, for God's sake, celebrate difference! (If such a Being (or panoply of Beings) exists, we can be sure that It delights in difference! Whatever else evolution affirms, it certainly affirms that!).

We should never assume that anyone has the right, or obligation, to change another nation's form of government or to replace its leadership because it does not conform to the requirements of some 'ideal' of an interfering nation or organization.

Nor is it the right of any person or government to sponsor internal protest in another nation (whether through propaganda, provocateurs, weapons supply or anything else!). Nations have both a right and a duty to sort out their own internal problems without the interference of Western - or any other - governments or agencies. As Vladimir Putin insisted, 'any society, culture and civilization should have the right to choose its own path and socio-political system'.³⁵²

The long-held belief in Western nations that they have perfected a system of government which is 'best' for 'all nations' is, as we've seen, nonsense!

Claims that, while Western nations live in a 'garden', the rest of the world is an untamed 'jungle' that needs their 'help' is also hubristic nonsense.

Josep Borrell, High Representative of the Union for Foreign Affairs and Security Policy, of the European Union spelled out Western Europe's blinkered (mis)understanding of what is happening: around the world.³⁵³

In a later keynote speech in Bruges at the *College of Europe*, Borrell provided a graphic picture of his (and the Western World's long-held) 'understanding' of the nature of the relationship between [the West and the Rest of the world](#):

Thank you to all of you, and congratulations to all of you for having the extraordinary chance of studying here, in Bruges at the College of Europe. I am sure you are aware of how lucky you are.

Here, Bruges is a good example of the European garden. Yes, Europe is a garden. We have built a garden. Everything works. It is the best combination of political freedom, economic prosperity and social cohesion that the humankind has been able to build - the three things together. And here, Bruges is maybe a good representation of beautiful things, intellectual life, wellbeing.

The rest of the world - and you know this very well, Federica - is not exactly a garden. Most of the rest of the world is a jungle, and the jungle could invade the garden. The gardeners should take care of it, but they will not protect the garden by building walls. A nice small garden surrounded by high walls in order to prevent the jungle from coming in is not going to be a solution. Because the jungle has a strong growth capacity, and the wall will never be high enough in order to protect the garden.

The gardeners have to go to the jungle. Europeans have to be much more engaged with the rest of the world. Otherwise, the rest of the world will invade us, by different ways and means.

Yes, this is my most important message: we have to be much more engaged with the rest of the world.

(Josep Borrell, ^œ[European Diplomatic Academy: Opening remarks by High Representative Josep Borrell at the inauguration of the pilot](#)

Apparently those living in post-colonial 'jungles' are to be blessed with more of Western Europe's gardening activities!

There are regions around the world which, like 'The Balkans', have long been considered peripheral, semi-cleared and semi-cultivated ^œ'less-developed' territories ripe for exploitation. Neocolonialism is alive and well in the minds of those who inhabit the 'gardens' of capitalism!

Houènou ^œ(1924) put it well:

We understand nothing of the egotistic and barbarous aims sought by certain civilized people who believe that civilization can only reach its zenith by ignoring original laws, and by debasing and enslaving men who have the natural right to live, to evolve, and to attain the full expression of their being...

...The problem arose at the moment of the discovery of America when Europeans intoxicated by glory, adventure, and above all by rapine, sought to conquer new territories which did not belong to them.

They destroyed the aborigines - exterminated them! Then, terrified at the void they had created around them and being themselves incapable of labor, they turned to Africa for workmen. It was Africa that furnished contingents for penal labor - this Africa with whose unhappy history you are unacquainted but which some day, one of her sons will outline for you in darts of fire, - a monument of shame for that civilization of which you boast.

'Africa', the Motherland of Humanity is awakening. It is emerging from a battered and abused 500 year past of genocide and exploitation to a new realization of its own inherent worth, of the incredible 300 thousand year old history of its peoples.

It is relearning the value of the amazing diversity of its societies and communities, of their historically forged melding with and husbanding of their natural environments.

And it will need to relearn the vital importance of patience, of calmly and deliberately fashioning a future based in a profound unity of its societies and peoples. A unity capable of celebrating the long-evolved and tested diversity of those communities in adapting to the realities of their various environments³⁵⁴.

Vladimir Putin reminded the world of an old African proverb: "If you want to go fast, go alone; if you want to go far, go together"

Attempting to emulate 'The West' will no doubt bring short-lived material 'prosperity' through exploiting and abusing Africa's abundant social, environmental and natural resources - just as it has in 'The West'. But, it will be at the expense of sacrificing that unique diversity which is Africa's invaluable heritage and humanity's last best hope in this new world of 'Western' delivered climate disaster and world-wide pollution.

'African Leaders', young and old, mature and immature, are confronted by a future which could well prove disastrous not only for their continent but for the whole world. They will have to draw on all the resources of their own unique history, experience and wisdom if they are to ensure that promised

future of profound unity safeguarding an incredible 300 thousand year-long evolution of human societal diversity.

May The Force indeed be with those involved in this new human endeavor. But, whatever they do, one can but hope that **they will not appeal** to those who delivered the current mess to them for guidance.

'The West' can only deliver what they've already given the continent of Africa in the past!

Problems of nation-building 🇳🇵

This is what 'The West' delivered not only to 'Africa' but to the rest of the invaded world through 500 years of domination and oppression.

The 'nations' created by colonial powers usually directly reflected the geographical territories which they had ruled. They usually incorporated a variety of ethnic groupings, sometimes traditionally opposed to one another, sometimes more closely tied to other communities not included within the national boundaries, and sometimes opposed through the activities of the colonial powers themselves ³⁵⁵.

In almost all colonial territories, a small Western educated minority, very often representatives of a number of separate ethnic groupings in the colony, had been groomed to consider themselves members of the middle-classes of the colonizing powers. Houènou ^œ(1924) described his own attachment to France:

To begin with, I must completely absolve France from the policies of some of her children. We who have been reared in the Motherland - we know her, we love her, and we have unshakeable confidence in her.

But, I regret to say, though I say it fearlessly, that the representatives whom she sends to her colonies fail to perform their duties. More than that, they betray the interests of France and compromise her future. They betray the interests of Africa, and thereby compromise the future of a people who has the right to exist.

My sympathy, my affection, my love for France cannot be doubted; for in the critical hours of 1914, without compulsion of any sort, I assumed spontaneously the duty of all citizens and exposed my life like all Frenchmen.

The sense of inclusive, co-operative identity between middle ranking people *preceded* the establishment of most Western European nation-states. The small educated minority from the colonies were educated to identify with those middle ranking people.

However, as Houènou claimed, they often felt they had been tolerated rather than whole-heartedly included in middle class company, "by special favor and grudgingly made, citizens" of the colonizing power. In many ways they were neither fully accepted as citizens of the 'Motherland', nor, any longer, closely identified in their own minds with people in the colonies from which they had been taken.

The nationalism of most Third World nations consisted in the desire of these Western educated individuals to validate themselves by taking over the reins of government from colonial administrators. This was coupled with a strong desire on the part of the populace to be freed from foreign domination.

In most new nations, the post-colonial nation-state preceded the emergence of nationalism amongst the vast majority of the population. Those who inherited government, inherited a responsibility which few colonial administrations had accepted - they would have to find ways in which to develop and maintain a sense of nationalism amongst the diverse peoples of their national territories.

The unity of a colony was, to the colonial power, a consequence of its administration, and did not require the active endorsement of the

indigenous populations. The post-colonial nation-state, however, as a result of very strong international pressures and a presumption of the universal applicability of Western democratic forms, needed to receive its legitimation from the population.

Post-colonial governments, unlike the colonial administrations which preceded them, needed to be ratified through the identification of their populations with them as legitimate and unifying authorities within national territories.

Colonial powers had provided administration, and administrative representatives down to the local village and household levels in the form of magistrates, police, wardens, and council officers. They had imposed these structures and authorities on the colonial populations. They had assumed, but had not felt any need to engender, the commitment of villagers to their supervision.

In contrast, post-colonial governments needed to engender in their populations a sense of 'belonging' to the nation, rather than to a particular region, ethnic group or clan. Governments, therefore, had to intrude into the lives of their constituents in ways not contemplated by most colonial authorities.

Bice Maiguashca explained it well:

As for the Third World, during the 1950s and 1960s most of the newly created states concentrated their attention on establishing political centralisation and fostering national integration. As a consequence, most indigenous peoples, who had enjoyed a relative degree of autonomy during the colonial period, now found themselves under the authority of local elites who were driven by the imperative of 'nation-building' and who sought to consolidate their precarious hold on power through any means available to them ...

(Maiguashca 1994, p. 361)

National governments, handed control by colonial authorities, had to intrude into the identities and self-definitions of relatively insular regions, ethnic groups and clans. They had to attempt to inculcate new perceptions and understandings, through which people would primarily define themselves as members of the nation, so as to weld them into a coherent whole.

They had to begin 'nation-building' in a way not confronted by their colonial predecessors.

Those who inherited the reins of governmental power usually saw their task as one of establishing a European-style 'nation-state' ³⁵⁶. The motives for support by the majority of the population however, usually had less to do with the establishment of a nation-state than with the displacement of those who had imposed such ideas upon them.

This new, and often very intrusive, involvement of national political and governmental activity in local and regional affairs created mounting tension in many regions. In many countries the resentment generated by such intrusion led to independence claims by regions and ethnic groups.

Decentralization of Political and Governmental organization

Most colonial authorities, though claiming to be aware of the strong divisive forces which existed within the territories they were handing over to indigenous elites, counseled new governments to devolve political and

administrative authority to regions. This decentralization of political and governmental organization and activity, it was hoped, would dampen demands for secession from the new nation.

This emphasis on devolution echoed conventional wisdom in political and economic development circles. In order to ensure grassroots involvement in political and economic development, it was believed necessary to involve people as directly as possible in the responsibilities of government ³⁵⁷.

Premdas and Steeves (1984) spelt out the rationale clearly:

If decolonisation means anything, it would at least entail the dismantling and re-orienting of the inherited bureaucracy rendering government administrative behavior subservient to community will. In essence, decolonisation at the grassroots becomes more of a reality where decision making and execution do not remain the monopoly or preserve of civil servants but rather are controlled by elected local councils.

The overdeveloped centre must be deconcentrated to the periphery; a meaningful measure of autonomy in political decision making should be devolved to the vast majority of citizens who are rural dwellers ...
(Premdas & Steeves 1984, p. 2)

However, the problems confronting new nations could not be so easily overcome. In most countries, devolution of governmental responsibilities to provincial and regional governments simply multiplied the problems associated with governing through poorly legitimized political structures. A further level of inefficient, ineffective bureaucracy and political office was added to a structure which was quickly to come under real strain ³⁵⁸.

Once regions gained political voice of their own, it became easier for regional interests to argue for secession, centered on the existing regional political and bureaucratic structures. Many post-independence separation movements focused their rebellions through taking control of provincial and regional governments in their areas.

Post-colonial governments faced challenges to their autonomy from several directions:

- international organizations and major international political powers placed strong demands on them to accept and act on their priorities and interests;
- the deregulation demanded by those involved in the emerging international economic order made governments less and less able to control economic and welfare activity within their territories;
- and regional forces challenged the legitimacy of the nation-state.

Benjamin Barber and Regine Temam (1992) claimed that internationalization and tribalism in the 1990s were still, and perhaps even more successfully, undermining the traditional political institutions of the nation-state.

On the one hand, global economic and ecological forces were requiring increasing integration and uniformity in the world, with deregulation making national borders permeable. On the other hand, nations were being threatened by 'resurgent, conflicting nationalities and tribal enmities' (Barber & Temam 1992, p. 13).

The leadership and internal organization of regional and ethnic groups and clans incorporated within the new nations had very often been warped, disrupted and weakened during the colonial period. Those (primarily Western educated elites) who sought power in the new nations found in those groups fertile soil for their own ambitions. They often attempted to subvert and/ or displace 'traditional' leadership in order to establish personal support-bases within their own ethnic and regional communities through which they could gain control of the national government ³⁵⁹.

Ikejiani described the scene in Nigeria in 1964, three years after gaining independence:

It is glaringly evident that the distinguishing mark in Nigerian public life presently is not a man's political philosophy, or religion, or party, or education, or wealth, or personal qualities, but in the last analysis his tribe or origin.

Nigerians carry these tribal thoughts into all aspects of their daily life. They carry them into their friendships, into their occupations, into their loyalties and into their prejudices.

Politics in Nigeria not only has a regional cleavage, subtle and most grossly evident, but also clan connotation. There is a deep struggle for tribal superiority as well.

... It is certainly beyond dispute that in our factories and shops, in government offices, in corporations and in our various institutions, appointments and promotions are made, in many cases, on tribal and clan calculations.

(Ikejiani 1964, p. 122)

Rather than a shared 'nationalism' amongst the populace, the leaders of new nations found that colonial administration had done little to weaken ethnic and clan loyalties and identities. It had been just as ineffective in establishing any sense of shared identity between the disparate communities within national territorial boundaries.

Most colonial people interacted with the colonial structures at the local level and seldom needed to think in terms of an over arching 'national' bureaucracy. In consequence, for most people, pre-colonial political allegiances, while distorted by colonial experience, were still potent. Chukwudum Okolo put it well:

Perhaps the best description of the African reality is tribalism, which is Africa's foremost social evil. Tribal wars have long been part of the continent's chequered history, and a source of social, political, and economic distress since independence. The identifiable cause of coups in Africa lies in tribal struggles for power.

(Okolo 1989, p. 33)

Indigenous Nations have the right of self-determination 🇳🇮

 (31/05/17)

During the 1990s, with Third World governments assumed to be firmly in control of their national territories, an international emphasis emerged on minorities, on 'the Fourth World' or 'Indigenous Nations' (see Hughes 1997). The ^{ae}*International Covenant on the Rights of Indigenous Nations*, presented to the Geneva headquarters of the United Nations in 1994, provided a clear statement of the focus:

The Charter of the United Nations, International Covenant on Economic, Social and Cultural Rights, the International Covenant on Civil and Political Rights and resolutions and declarations of the World Council of Indigenous Peoples, the Inuit Circumpolar Conference, the International Indian Treaty Council and other international bodies related to these organs affirm the fundamental importance of the right of self-determination of all peoples, by virtue of which they freely determine their political status and freely pursue their economic, social and cultural development.

Paradoxically, as emphasis was increasingly placed on the globalization of economies and the emergence of supra-national political, social and economic integration, the rights of minority groups within national boundaries were increasingly emphasized in international debate. Representatives of such groups found receptive audiences in international forums and in First World nations in pressing claims for the recognition of:

... the urgent need to respect and promote the inherent rights and characteristics of Indigenous Nations, especially the right to lands, territories and resources, which derive from each Nation's culture; aspects of which include spiritual traditions, histories and philosophies, as well as political, economic and social customs and structures.
(UN 1994)

While continuing to treat the state as separate from and able to direct the activities of 'its people', international organizations and First World leaders ³⁶⁰ increasingly required Third World governments to recognize the rights of minorities within their boundaries. As the Covenant said:

Indigenous Nations have the right of self-determination, in accordance with international law, and by virtue of that right they freely determine their political status and freely pursue their economic, social and cultural development without external interference;

... Indigenous Nations may freely choose to participate fully in the political, economic, social and cultural life of a State while maintaining their distinct political, economic, social and cultural characteristics, and not relinquishing the inherent right of sovereignty.
(UN 1994)

By placing these demands in the context of Awolowo's description of colonial Nigeria, it becomes apparent that post-colonial authorities were going to face enormous problems if they accepted such demands and attempted to act on them:

There are various national or ethnical groups in the country [Nigeria]. Ten main groups were recorded during the 1931 census as follows: (1) Hausa, (2) Ibo, (3) Yoruba, (4) Fulani, (5) Kanuri, (6) Ibibio, (7) Munshi or Tiv, (8) Edo, (9) Nupe, and (10) Ijaw.... 'there are also a great number of other small tribes too numerous to enumerate separately...'

It is a mistake to designate them 'tribes'. Each of them is a nation by itself with many tribes and clans. There is as much difference between them as there is between Germans, English, Russians and Turks for instance.

(Awolowo 1947, pp. 48-9)

In part, these apparently contradictory emphases signaled the decreasing importance being placed upon nation-states in the world of the late 1990s.

In part, however, the emphasis on the rights of minorities also reflected the realities of the ethnic conflict which has been present in Third World nations since their inception, and which was becoming a major concern in the First World.

A 1995 *Food and Agricultural Organization* (FAO) report described the problem:

More and more small states are emerging, requiring new forms of extra-national arrangements and development assistance. Conflicts such as those in Bosnia-Herzegovina and Chechnya are recent and dramatic manifestations of an emergent nationalism that created new, and exacerbated old, political, economic, religious, and ethnic problems. Violence and war have continued unabated in various parts of the developing world.

(^œUN 1996)

Third World nations were being challenged by forces both inside and outside state boundaries ³⁶¹.

Since September 11th 2001, with the West re-oriented to seeking out and destroying 'terrorists' wherever they might be found (or imagined), those minorities which have not already secured rights (and many who have) find themselves categorized as 'terrorists' by central governments.

A new language has emerged to legitimize harsh reaction to minority demands. Branding a minority movement a 'separatist terrorist organization' seems to mute condemnation of any action against it from most Western governments. Adopting the policies and justificatory language of George W. Bush's United States, central governments have readily asserted, in the words of Henry Hyde, that:

We must be prepared not only to protect ourselves from new assaults, not only to intercept and frustrate them, but to eliminate new threats at their source. This must be a permanent campaign, similar to the ancient one humanity has waged against disease and its never-ending assault upon our defenses

(Hyde 2001)

With Western governments committed to similar reaction to those who oppose them around the world, it has become increasingly difficult for disadvantaged minorities to gain support or even a hearing in international forums. Movements which were supported during the 1990s are now cut adrift, to fend for themselves.

The consequences can be seen in the increasing flows of displaced persons, no longer welcome in Western countries which now see them - whatever their age or gender - as a looming threat to national security.

The World is Awash in Weapon Systems 🐼

 (25/03/16)

From the outset, most Third World governments have had to contend with the competing interests of powerful ethnic and regional groups, more intent on furthering their own interests than in ensuring workable national government. This, in many countries, has led to long-term civil unrest, insurrection, and civil war.

In the climate of the Cold War, such difficulties were compounded by international powers confounding tribal, regional and clan conflict with

ideological confrontation between capitalism and communism. The protagonists were, as we've seen, often armed and funded by competing international forces.

In the post-Cold War period, the flow of arms did not diminish. With huge stockpiles of weapons no longer required by Western and Eastern bloc countries, arms merchants were able to offer sophisticated weaponry at bargain basement prices with little or no check on the credentials or intentions of purchasers.

James Woolsey, Director of Central Intelligence, in testimony to the US Senate Select Intelligence Committee on 10 January 1995, claimed that:

... the proliferation of advanced conventional weapons and technology [is] a growing military threat as unprecedented numbers of sophisticated weapons systems are offered for sale on the world market.

Especially troubling is the proliferation of technologies and expertise in areas such as sensors, materials, and propulsion in supporting the development and modernization of weapons systems.

Apart from the capability of some advanced conventional weapons to deliver weapons of mass destruction, such weapons have the potential to significantly alter military balances, and disrupt U.S. military operations and cause significant U.S. casualties.

And Lt. Gen. James R. Clapper, Jr., Director of the Defense Intelligence Agency, before the same committee:

[W]hile we tend to focus on current and future high technology big-ticket items, it's important to remember that the world is already awash in weapon systems. These range from the relatively simple small arms and mines, to more advanced hand held surface to air missiles, to increasingly advanced anti-ship cruise missiles.

Any country with hard currency can and will get these systems. And while they won't lead to military defeat of U.S. forces, they certainly hold out the prospect of casualties. As we have seen in the past, this can have both a major impact on force planning for peacekeeping operations and a significant domestic political impact on their conduct. (^œ[Arms Sales Monitor February 1995, p. 3](#))

As Rachel Stohl has described, the 21st century has seen little change in the flow of weaponry to Third World territories:

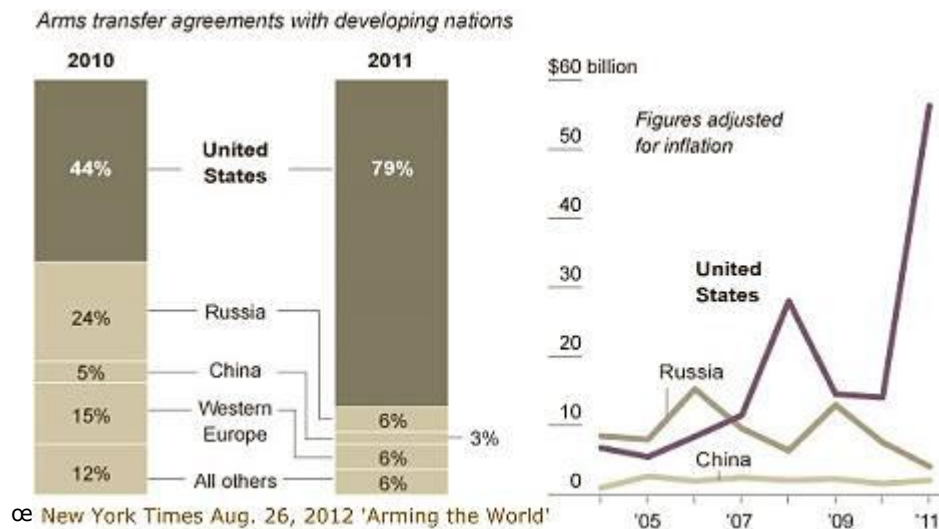

In the last six years, Washington has stepped up its sales and transfers of high-technology weapons, military training, and other military assistance to governments regardless of their respect for human rights, democratic principles, or nonproliferation. All that matters is that they have pledged their assistance in the global war on terrorism. (^œ[Rachel Stohl \(2008\)](#))

Thom Shanker, in A *New York Times* article, September 6th, 2009, entitled *Despite Slump, U.S. Role as Top Arms Supplier Grows*, outlined the continued growth in arms sales over the past several years:

In the highly competitive global arms market, nations vie for both profit and political influence through weapons sales, in particular to developing nations, which remain "the primary focus of foreign arms sales activity by weapons suppliers," according to the study.

Weapons sales to developing nations reached \$42.2 billion in 2008, only a nominal increase from the \$41.1 billion in 2007. (œShanker 2009) ³⁶²

As the following graph shows, arms transfers to the 'developing' world by the United States have sped up since the 2008 global financial crisis. The United States, in 2011, was responsible for 79% of all arms transfer agreements with Third world countries. ³⁶³.

Richard Grimmert and Paul Kerr (2012), presented a detailed report of arms agreements and transfers to the Third World between 2004 and 2011 to the US Congress. As they explained:

In worldwide arms transfer agreements in 2011-to both developed and developing nations-the United States dominated, ranking first with \$66.3 billion in such agreements or 77.7% of all such agreements. This is the highest single year agreements total in the history of the U.S. arms export program. Russia ranked second in worldwide arms transfer agreements in 2011 with \$4.8 billion in such global agreements or 5.6%. The value of all arms transfer agreements worldwide in 2011 was \$85.3 billion, a substantial increase over the 2010 total of \$44.5 billion, and the highest worldwide arms agreements total since 2004. (œConventional Arms Transfers to Developing Nations, 2004-2011, (US Congressional Research Service, August 24, 2012, R42678))

Updated reports on Conventional Arms Transfers to Developing Nations and related studies can be accessed from the œUS Congressional Research Service Reports on Conventional Weapons Systems website.

Parliamentary democracy, one-party states, military coups

Destructive as the weapons build-up and regional and ethnic challenges have been within Third World countries, there were other equally disruptive forces involved in challenging the viability of new nation-states. Where post-colonial governments were established through the electoral processes of democracy, those who entered parliament were supposed to conform to Western European parliamentary and governmental practices.

Parliamentary democracy, particularly of the Westminster form, depends on those elected seeing themselves as representatives, not of people in particular residential regions within the nation, but of particular 'parties' which represent the interests of particular social 'classes' and pressure groups, each with its distinctive ideology. Ethnic and clan differences are assumed to have been overridden by economically-based class distinctions which cut across group boundaries.

People are presumed to be committed to particular ideological positions espoused by the parties for which they vote.

Parliamentary democracy of Western European varieties philosophically presupposes a commitment by the majority of the population to the nation, with individuals vicariously sharing in the achievements of the nation as though they were their own achievements³⁶⁴. Thomas Hobbes, in the 17th century, provided the philosophical underpinnings for this form of nationalism. The commitment of individuals to the nation creates:

... a real unity of them all in one and the same person, made by covenant of every man with every man, in such manner as if every man should say to every man: I authorise and give up my right of governing myself to this man, or to this assembly of men, on this condition; that thou give up thy right to him and authorise all his actions in like manner. This done, the multitude so united in one person is called a COMMONWEALTH.
(Hobbes 1909 [1651], ch. 17)

The government becomes the individual writ large, and individuals effectively enter into contract with the government to support it as long as all other individuals in the nation do so, too. However, as we have seen, this form of commitment presupposes an existing unity or nationalism amongst the populace. Government is aimed at balancing the competing interests of classes and pressure groups, fulfilling their aspirations at the national level.

Neither the 'classes'³⁶⁵ nor widely endorsed 'parties'³⁶⁶ and ideologies existed in most newly independent countries.

The Nigerian Head of State, ^{oe}General Murtala Mohammed, speaking to the Nigerian Constitution Drafting Committee in 1976, spelt out the problem:

Since the inception of this Administration, and particularly since the announcement of your appointment as members of the Constitution Drafting Committee, there has been a lively debate in the press urging the introduction of one form of political ideology or another. Past events have, however, shown that we cannot build a future for this country on a rigid political ideology. Such an approach would be unrealistic.

The evolution of a doctrinal concept is usually predicated upon the general acceptance by the people of a national political philosophy and,

consequently, until all our people, or a large majority of them, have acknowledged a common ideological motivation, it would be fruitless to proclaim any particular philosophy or ideology in our constitution.
(Murtala Mohammed 1976, pp. 12-15)

As Murtala Mohammed argued, variant political ideologies within a nation detail alternative biases in organization and activity, based on a common underlying understanding of the world and commitment to national government. Where that common understanding and commitment do not exist, it is difficult, if not impossible, to gain widespread, long-term support for the particular ideology of a political party. Rather, people define themselves in terms of ethnic and regional identity.³⁶⁷

In Third World nations, those elected to office have sometimes publicly endorsed particular political ideologies³⁶⁸ which have spelt out alternative forms of centralized government of the nation. However, most of them already knew, or soon found, that their constituents were not committed to the articulated ideology and many of them simply did not understand its rationale.

Instead, people presume members of parliament to be committed to the communities which they represent. The communities do not see central government as an important institution through which the national economy might be safeguarded and nurtured or through which the nation might achieve 'stability' or 'economic well-being' or 'greatness'. Rather, they see it as the source of jobs, wealth and goods which could flow to themselves if their representative is astute.

Okwudiba Nnoli described this problem in post-colonial Nigeria:

Nigerianisation involved efforts by the ethnically based ruling parties in the regions to secure the complete domination of the regional public service positions by the relevant regional functionaries, or, in their absence, to prevent rival ethnic groups from filling the relevant posts. This same strategy was evident in the inter ethnic struggle for positions in the federal public service.
(Nnoli 1980, p. 196)

Paula Brown spelt out a similar scene in her study of leadership in the New Guinea Highlands:

... achievement of a high elective position has the greatest prestige and rewards ... The competition and ambitions of Simbu are demonstrated in the large number of nominees, the lavish expenditure of candidates on their campaigns, the significance of success and expectations of rewards by their followers.

Support of a candidate is an important rural social activity. Provincial and national political office are the counters in Simbu intergroup and interpersonal competition of the 1980s.
(Brown 1987, p. 102)

This direct relationship between the politician and his or her constituency is, of course, closer to the Athenian ideal of democracy than is the party system of Western democracy. But, in the absence of a sense of unity amongst all those whose representatives formed government, it resulted in political and governmental chaos.

When parliamentarians are intent on ensuring that as much of the national wealth as possible is siphoned off to themselves and to their regions,

government becomes a process of dividing up the spoils of office, not of focused 'national development'. As Brown said:

With the continued concentration of financial resources in government, politics is the way to wealth ...

Power and prestige in the province focus upon the town; a multi ethnic elite runs the affairs of the province and has connections with the national government, business, and sports activities. The rural communities are its dependents and the source of votes, customers, clients, and parishioners.

... these leaders are not detached from their rural relatives for two reasons.

First, the selected officials represent rural constituencies where they must be nominated, campaign, receive votes, and serve rural supporters. In their distribution of benefits they reward their supporters and constituents with jobs and services.

Second, the upper and urban segment is not independent of a rural base. Although they may live and work outside the rural area they contribute to rural affairs of their kinsmen, clan, and constituents and participate in some rural activities.

(Brown 1987, p. 103)

Nnoli described the situation as it developed in Nigeria:

Most Nigerians have come to believe that unless their 'own men' are in government they are unable to secure those socio-economic amenities that are disbursed by the government. Hence, governmental decisions about the siting of industries, the building of roads, award of scholarships, and appointments to positions in the public services, are closely examined in terms of their benefits to the various ethnic groups in the country.

In fact, there has emerged a crop of 'ethnic watchers' who devote much of their time and energy to assessing the differential benefits of the various groups from any government project.

(Nnoli 1978, p. 176)

During the 1980s, while living on the island of Tabiteuea in the Republic of Kiribati in the central Pacific during national elections, I canvassed the views of people as to the right kind of parliamentarian for their community. Every person with whom I spoke said that it was the responsibility of the elected person to gain as much for their community as possible from the central government.

People also focused on the cash income and other benefits flowing to the holder of the office. It was felt that the position of member of parliament was something of a sinecure, and the salary and 'perks' which went with the job belonged not only to the member but also to the community to which he or she belonged. It was, therefore, reasonable to 'share the job around', so that a number of communities might benefit from this cash flow.

The candidates all similarly claimed that they would only be elected if they could show that they could obtain more for the community than others before them and that their own income would be more widely distributed. Re-election depended on this perception of the performance of the member of parliament.

The man who was finally re-elected for a second term had developed a strategy through which his income was shared beyond his own community. In fact, he insisted, and it seemed correct, that he spent more of his money in helping marginal groups than in helping those who strongly supported him and considered him a member of their community.

Both the candidates and people in the electorate were able to name those in the previous parliament who had been most successful. In all cases their success was judged by what they had managed to obtain for their electorates.

When I asked people how they knew who were most successful, they answered that they knew through listening to the parliamentary broadcasts. People in the community who had radios (and many who lived nearby) often listened to parliament. The aim was not to find out about the country's external relations, or to judge the effectiveness with which the nation was being governed. Rather, they wanted to hear who were most forceful and effective in representing their electorates and which electorates were being favored in any 'development' exercises or in infrastructure maintenance and upgrading.

If the community felt that their representative was inadequate, that person was most unlikely to be re-elected. So, each new parliament comprises large numbers of new members, with little or no experience of parliamentary procedures, and far more commitment to their own electorates than to centralized government.

Papua New Guinean parliamentary experience ³⁶⁹, during the 1980s and 1990s, demonstrated a similar problem. Some sixty per cent of those elected in national elections were first timers, elected because they were perceived to be capable of better representing the interests of their communities and regions.

Not only are members of national and regional parties considered to be conduits of wealth and goods to their electorates, local-level politics is similarly competitive. Peter Weil (1971) explained this well for local council activity in the Gambia:

Within any given electoral ward, various villages have particular demands. Inevitably some villages do not get the well or other project they have been demanding during their councillor's tenure, and the interests of these villages will then probably be in opposition to those of other villages.

If a group of villages tends to unite around an issue, that group tends to be opposed by another group of villages with another issue. Thus, a type of opposition over specific issues operates at the local level in Area Council elections.

(Weil 1971, p. 110)

This orientation, of course, makes it extremely difficult to govern nationally, regionally or locally. Parliamentarians and councillors are far more interested in gaining resources for themselves and their constituents than they are in regional government and development planning.

It is more important to obtain these resources than to observe the niceties of Western concepts of 'honesty' and 'integrity'. These are based on a presumption of the separation of politics and administration, of political activity and government spending. Third World governments, therefore, at whatever level, seem, almost inevitably, to be riddled with 'corruption'.³⁷⁰

Politics becomes reduced to patron-clientism, with those in power concentrating wealth and influence in their own hands, maintaining their support bases through providing privileged access to the jobs, wealth and influence they control. As Awazurike has claimed:

The evidence in the last decade continues to point to a dismal outlook for third-world democracies ... The twin forces of economic woes and the opportunism of powerful oligarches ensure that from India and Pakistan to Bangladesh and Sri Lanka, the fate of fledgling attempts at democratization continues to raise more questions than answers - not least of which is the seeming ambivalence of the advanced industrial nations to the spread and deepening of genuine democratic movements since the late 1950s.
(Awazurike 1990, p. 56)

One-party states

In many post-colonial nations, leaders, in the face of such pressures, did away with democratic multi-party politics, declaring 'one-party' states with strong leaders who appointed the representatives from each region of the country, or who ensured that the candidates in any election all accepted their leadership.

The ways in which this shift to single-party rule were effected varied from country to country.

The movement to one-party rule was, of course, often not entirely internally determined. In the international climate of ideological battle, the intelligence services of major Cold War countries attempted to ensure that Third World governments remained ideologically committed to their bias.

In Indonesia, the 1965 mass murder of hundreds of thousands of 'communist sympathizers', the overthrow of President Sukarno and the installation of Suharto as President of the country in 1967 seems to have been a consequence of just such activity³⁷¹. This reorganization of political activity placed the ruling party (Golkar) in the powerful position of claiming the allegiance of the armed forces and members of the civil service, scrutinising and approving the constitutions and platforms of the other parties and of controlling their electoral activities in rural areas. (See ^{oe}Kathy Kadane (1990))

The President was given the right to dissolve any political party whose policies were not 'in the interests of the state' or whose membership comprised less than one quarter of the population. Indonesia became, and effectively remains a 'one-party' state, despite its apparent multi-party organization.³⁷²

Indonesia was not alone in reorganizing its political landscape. In Africa, by 1969, ninety per cent of the post-colonial nations were governed through single-party systems or by military regimes, many of which justified their seizure of power by claiming that the elected governments had become irredeemably corrupt (Young 1970, p.460). In former Asian colonies effective one-party states quickly emerged in most countries, and military coups occurred in many of the new nations. Sangmpam claimed that:

Third World countries are characterised by a specific form of political competition marked by violent eruption of conflicts. From 1958 to 1965, about 70 percent of Third World countries experienced violent conflicts ranging from secession to open warfare, and 68 military coups

were successful. From 1965 to 1985, about 130 coups occurred in Third World countries; of about 10 million violent, conflict-related deaths in the world, 99.94 percent were in Third World countries ... (Sangmpam 1994, p. 4)

Where one-party government was imposed, or governments were deposed by military leaders, this frequently seemed to provide strong central government, though such governments have been widely condemned for their 'human rights' records. Fred Riggs claimed that:

... data from a 1985 survey of Third World regimes reveal correlations between breakdowns and regime type. The high survival level of single-party regimes reflects the ability of ruling parties to control the elected assembly (and hence to govern arbitrarily), and to dominate the bureaucracy (and hence to prevent a coup). By contrast, since all presidentialist regimes in the Third World have experienced catastrophic breakdowns, it is concluded that the ability of divided government to control its bureaucracy and to provide coherent policy direction is so flawed that coups are virtually unavoidable. (Riggs 1993, p. 199)

Military coups

Throughout the Third World multi-party democracies have, as Riggs suggested, 'experienced catastrophic breakdowns', usually followed by military coups. Arthur Nwankwo spelt out his view of the situation in Nigeria in 1966 when a multi-party, democratically elected parliament was overthrown by a military coup:

On 15 January 1966 Nigeria's post-colonial experiment with democracy ended when soldiers struck, killing some politicians, sacking the civilian government, and imposing military rule. Several factors were responsible for the collapse of Nigeria's First Republic, but among the most crucial was Regionalism, with its attendant ethnic dominance of each of the three regional governments.

The regions constituted the political base for the contenders of power at the Federal level, and tribal or ethnic sentiments were used by these politicians to whip up support for their equally regionally and ethnically-based parties ... In the struggle, the powerful regional governments overwhelmed and incapacitated the Federal Government, regardless of the central government's constitutional superiority.

Thus, it was not the Constitution that failed, but the politicians who operated it, for they were too narrow-minded, too reckless and intellectually and emotionally unprepared for the functions the Constitution placed on them. It was the violent rivalry for power among the politicians, coupled with massive corruption, brazen injustice and political and religious intolerance which brought about the demise of the First Republic.

(Nwankwo 1984, pp. 6-7)

Where military coups were avoided, multi-party democracy has usually been displaced by single-party systems. Since countries which opted for one-party rule or which were ruled by military juntas were often already experiencing inter-group tension and confrontation, in many cases the imposition of military or one-party rule masked continuing conflict within the nation. In Nigeria, as in many other countries ruled militarily, military rule has been punctuated by coups and counter-coups.

In both militarily ruled and one-party states, those holding power have intruded ever more directly and forcefully into those areas of activity which Western people are strongly convinced should be outside the realm of politics. Sangmpam has argued that the state, in many Third World countries, has become 'over politicized'. As he said:

By over politicization I mean

- the use of overt compulsion by those holding power to organize political representation, participation, and competition for ... goods and services ... ;
- the fluidity of state power and constant insecurity characterising holders of state power in their relations with other social actors;
- political participation and competition outside established institutions;
- the lack of compromise over the outcome of political competition; and
- the general use of open violence and confrontation in such participation and competition.

(Sangmpam 1994, p. 5)

Political, Economic and Social Integration: A Patron-Client World 🇮🇩

Rather than government providing a stable backdrop to the self-interested activities of people competing within the marketplace, political power holders have become direct players in the economic sphere, using their positions and power to advantage themselves and their supporters.

This has effectively reoriented many Third World communities toward patron-client forms of political, economic and social organization. The activities of political, business, traditional, military and other leaders become interfused as networks of mutual support and promotion develop. In such patron-client oriented systems, political and economic spheres are intermeshed. To succeed economically, one needs a political patron.

Richard Robison (1990) provided a description of a variety of forms of this kind of political / economic activity in Indonesia. The most important of these in Third World countries is undoubtedly what he called 'bureaucratic capitalism'. As he explained,

bureaucratic capitalism is a product of patrimonial bureaucratic authority in which the demarcation between public service and private interest is at best blurred.
(1990, p. 14)

Many of those involved in this kind of political activity develop 'joint ventures' with overseas companies and transnational corporations. The politician, or person who has strong links with political authority, obtains licences, concessions, finance, and favorable terms of business for the overseas partner and, in return, holds stock in the company formed within the country or is rewarded in other ways. As Robison explained,

The central feature of the joint venture is the exchange of politically controlled economic concessions for financial reward.
(1990, p. 17)

While Robison's study focused on such activity in Indonesia, very similar arrangements can be found in almost every Third World country.

For businesses involved in this kind of activity it is very important that the political leaders be secure and hold power over a long period. Every political upheaval becomes a business upheaval as new political patrons have to be secured.

For this reason, many multinational and transnational businesses have been accused of supporting dictatorial, repressive regimes, securing their own interests by ensuring the long-term survival of their patrons.³⁷³

Where this cannot be arranged, businesses have to hedge their bets, securing the commitment not only of key political figures of the present, but also likely future players. The game becomes much more complex and certainly more costly.

It is, therefore, less likely that foreign businesses will be attracted to countries where the political leadership is likely to be displaced in a short period, whether by electoral or any other means. Economic 'development', therefore, seems to favor stable regimes, as the East and South-East Asian countries have demonstrated.

Political support is not only available to foreign companies (though these are usually the most lucrative source of income). Similar arrangements are made with business people within Third World countries. As Sklar and Whitaker described of Nigeria two decades ago:

In every region, the party waxed fat in its house of patronage. It had money, favors, jobs, and honours to distribute among those who would support it. To a large extent, these regional patronage systems were based on regional marketing boards ...

Invariably, the vast majority of those who receive or hope to receive loans from the boards or the banks are attracted by powerful inducements to join or support the regional government party; insofar as they prosper, they may be expected to support the party financially. The same may be said of commercial contractors who work for the regional governments and their statutory corporations

Who are the masters of the regional governments? High-ranking politicians, senior administrators, major chiefs, lords of the economy, distinguished members of the learned professions ...

(Sklar & Whitaker 1991, p. 79)

As key economic, political, professional, military and traditional leaders support one another, avenues to wealth are increasingly controlled by them, to be made available, at their discretion, to those who support them. The result is what is commonly seen in Third World countries: a marked division between the 'haves' and 'have nots', with those who do not have access to the wealth of the region increasingly dependent on those who have, tied to them in bonds of clientage.

In the climate of ethnic and clan rivalry which exists in many Third World countries, patrons and clients see their interests as separate from those of opposing groups which are also competing for the spoils of political and economic power. The consequences, as both Sangmpam (1994) and Weil (1971) have suggested, are increasing tension and eruptions of violence which cannot easily be countered.

In the worldwide political climate of the 1950s-1980s, this usually meant that one or other of the internationally dominant ideological blocs readily financed and armed opposing groups, leading to continued unrest and rebellion. Opposing leaders, each intent on establishing their patronage and power, soon learned to speak the language of international ideological tension, and so ensured funding of military requirements in either resisting or instigating rebellion and armed insurrection.

Over the last decade, the language employed to gain support has changed, but the consequences have not. Now, support is given to bolster regimes or favored insurgents in combating 'international terror' rather than 'Communism', but the results are very similar ³⁷⁴. Third World politicians and their economic counter-parts have learned a new language and are becoming increasingly fluent in its use.

From 'Soldiers of Fortune' to 'International Security Companies'

In the 1990s, privatization became the name of the game. It was argued that the reason why Third World governments had failed to 'develop' their countries was that they had incompetently interfered in economic activity. This was much better left to the 'market-place'. The new emphasis was introduced to Third World peoples through a variety of structural adjustment programs (SAPs) imposed by the World Bank and the IMF.

Not only was private enterprise the new key to development, it was also argued that if security was left in the hands of Third World governments, politicians would use this as a means of leveraging international businesses operating in the country. It became increasingly acceptable for transnational companies to hire 'security firms' to ensure the safety of their operations in areas of political instability and lawlessness. This was justified by corporations as being very similar to their use of such private security agencies in Western countries. If the scale of security operations was greater, this was simply because security problems in many Third World countries are more acute.

The use of mercenaries is, of course, not new. As Gilbert Murray described of British practice in the late 19th century,

In military operations, again, we of the British Empire depend to a quite enormous extent upon soldiers of alien race, more, possibly, than any State since Carthage. Nearly all our African fighting before the present war, and most of our Indian fighting, has been done for us by natives. The great victories of Clive over the French, which we are accustomed to regard as proofs of British strength or valour, were almost entirely victories of Sepoys over Sepoys.

The economic situation is really the same as in the other cases. We cannot spare more of the ruling race to fight. We take instead some naturally warlike savages, train them, officer them, and make them do the fighting for us.

(Gilbert Murray 1900 p. 144)

In the first decade of the 21st Century, the use of private security firms has become very wide-spread, fuelled by the employment of these organizations by the U. S. military and by major corporations and organizations operating in danger zones in non-Western countries. Hundreds of 'privatized military firms' now exist, operating in over fifty

countries, with annual revenues well in excess of a hundred billion dollars
375.

The effect of these developments has been to reintroduce mercenary soldiers into non-Western countries in the guise of security personnel. The mercenaries which plagued African communities during the 1970s were funded as expatriate soldiers who were supporting regimes fighting 'communist insurgency'. The new mercenaries, in the spirit of the times, are [seen to be fighting 'international terror'](#), the enemies of democracy and capitalism.

They are ensuring the stability of regimes (or the successful insurgency of an opposing group if a regime proves unreliable) and the profitability of transnational corporations. As such, they no longer come in the crude guise of soldiers of fortune, now they come as 'security consultants', providing security services and helping to 'privatize' yet another arm of government activity, forming an even closer alliance between transnational corporations and their political patrons.

Civil/military rule

In many countries, long-term 'civil-military' regimes have emerged, in which the leadership, while 'civil' (that is, not holding military rank or position), is closely allied with the military leadership. As Hassan Gardezi described, there has emerged, in Pakistan, a 'strong bureaucratic-military oligarchy at the helm of the state which uses its regulatory powers to mediate the mutually competing and at times conflicting interests' (1985, p. 1) of the country.

Arthur Nwankwo, writing of Nigeria, suggested that this form of rule should be called 'cimilicy' and should be based on:

... civilianising the military and militarizing the civilians in a new arrangement for a new dispensation.

Government being the authoritative allocator of national resources in response to articulated and organized group interests, it is necessary that people who participate in government articulate and organize their views and work together, each being fully conscious of the strength, weaknesses and rights of others in a new social compact where the artificial lines of demarcation between the military and the civilians is eradicated.

For in theory and in deed, all civilians and all military persons of Nigerian extraction are Nigerians and are entitled to equal rights, privileges and dispensations and equally endowed for the onerous task of building a New Nigeria.

(Nwankwo 1984, p. xii)

To date, Nigeria has not managed to establish a stable coalition of such interests. Other post-colonial states, however, have been much more successful in pursuing such policies. In nations as diverse as Egypt and Indonesia, this kind of civilian-military alliance has been effectively pursued over some thirty to forty years.

The degree to which such alliances have disenfranchised communities and populations has been a matter of vigorous debate over the past fifteen years. It has commonly been claimed that such 'dictatorships' ride roughshod over individual human rights, as expressed in various United

Nations declarations. Some of the more stable of these regimes have replied, as Indonesian authorities have, that:

It is now generally accepted that all categories of human rights - civil, political, economic, social and cultural, the rights of the individual and the rights of the community, the society and the nation - are interrelated and indivisible. The promotion and protection of all these rights should therefore be undertaken in an integrated and balanced manner. Inordinate emphasis on one category of human rights over another should be eschewed.

Likewise, in assessing the human rights conditions of countries, particularly developing countries, the international community should take into account the situation in relation to all categories of human rights - following the principles contained in the Universal Declaration of Human Rights. Article 29 of that Declaration addresses two aspects that balance each other: On the one hand, there are principles that respect the fundamental rights and freedoms of the individual; on the other, there are stipulations regarding the obligations of the individual toward the society and the state.

(Alatas 1993)

United Nations emphasis on the rights of individuals, at the expense of community and nation are considered unbalanced and in need of correction. However, such statements have been vigorously rejected by pro-democracy groups throughout the world. As Jeremy Hobbs of Community Aid Abroad (CAA) claimed:

Australia's special relationship with Indonesia is viewed with bitter cynicism by Indonesian non-government organizations. For them it is supremely ironic that Australia, arguably the most democratic country in the region, is not prepared to take a tougher line on free speech, human rights, democracy and labor issues. Worse, we have been happy to fill the breach when the [US] Clinton administration withdrew military support because of its concerns over human rights.

(Hobbs 1995, p. 1)

Since the collapse of the Soviet Union, the Western powers have increasingly insisted on a return by Third World governments to multiparty political systems based on Western democratic ideals. As Andrew Purvis claimed:

As recently as five years ago, sub-Saharan Africa seemed poised on the verge of a new democratic era. The end of the cold war and mounting pressure from Western donors for political reform as a condition for ongoing aid led to a flurry of multiparty elections, and millions of voters eager for a change trekked to the polls ... [However] Africa's veteran rulers know what they are up to. Many of them have been denied foreign aid because of their autocratic regimes. But once elections have been held, or in some cases merely promised, Western aid dollars begin flowing again

... This is not the first time Africa has wrestled with multiparty governance. Immediately after many countries gained independence in the 1960s, political parties flourished, elections were called, and voters rejoiced. But then many of independent Africa's founding fathers convinced their people that the single-party state was the only way. The result was the lost years of the '70s and the economic disarray of the '80s. The only hope is that Western donors, together with Africa's

more reform-minded leaders, will not stand for such backsliding again.
(Purvis 1996)

Like Purvis, many Western commentators believe that most of the Third World's woes can be traced to the forms of government which have emerged over the past forty years. Autocratic governments, dominated by corrupt, self-serving politicians, have mismanaged economies and increased their own wealth and power at the expense of their electorates. In order to overcome these problems, it is considered necessary to return to Western governmental practices, to multi-party, democratic government.

However, it can be argued, as Nef (1991, pp. 16ff. ³⁷⁶) did for Latin America, that, in part, the emergence and dominance of repressive regimes has been a requirement and a consequence of the kinds of 'economic development' pursued in those countries since the late 1960s. The unpopular, 'structural adjustments' which Third World governments have been required to make by both the World Bank and IMF have required political controls not available to truly democratically elected governments.

The developmentalist models of Third World development experts, which placed emphasis on the role of government in stimulating and guiding economic development, came into disrepute during the 1970s. At about the same time, the Keynesian economic models of the West came under siege from neoliberal alternatives. In their place the neoliberal monetarist policies of Margaret Thatcher in Britain and of conservative politics throughout most of the Western world during the late 1970s and the 1980s and 1990s, became the stuff of development specialist advice in the Third World through the 1970s and since that time.³⁷⁷

This shift coincided with a rapid increase in Third World indebtedness following a sharp increase in oil prices in the early 1970s. From the late 1970s, lenders became increasingly concerned at the mounting debt of Third World countries. As Dan Connell has said, 'From 1970 to 1989, according to UN reports, Third World debt skyrocketed from \$68.4 billion to \$1,262.8 billion, leaving several nations owing more than they produce in annual income' (1993, p. 1).

This came to a head in the early 1980s, when international creditors decided it was time to act to protect their investments. For most, the central consideration in ensuring the economic viability of Third World nations was the 'downsizing' of government and the deregulation of all economic, financial and fiscal activity.

Effectively, this meant a complete reorganization of government, a determined swing away from 'left-wing' politics to the politics of the marketplace ³⁷⁸. Such radical restructuring has inevitably resulted in mounting tension within the affected countries.

Cheru spelt out some of the demands of such programs:

- a) liberalization of import controls;
- b) devaluation of the country's exchange rate;
- c) a domestic anti-inflationary program which will control bank credits and [exercise] control over government deficit by curbing spending, increased taxation, abolition of consumer subsidies;
- d) a program of greater hospitality to multinational companies (MNCs)

... As President Kaunda of Zambia put it, 'The IMF does not care whether you are suffering economic malaria, bilharzia or broken legs. They will always give you quinine'. The policy prescriptions listed above reflect the Fund's political and economic ideology rather than the interests of the developing countries.
(Cheru 1989, p. 37)

In order to ensure that the necessary 'structural adjustments' were made to Third World economies so that they might benefit from the increased competitive advantages that it was assumed would accrue from an unfettered 'enterprise economy', governments needed to be firmly in control, able to apply the 'pain' which would, necessarily, precede the economic 'gain' of this radical shift from welfare economics to free market economics.

As an astute commentator described for Chile, one of the first Latin American countries to experience these changes:

After overthrowing the elected Allende government in 1973, the Chilean military crushed leftist parties, unions, and peasant associations. Then, in an unwelcome surprise to some elites that had initially invited the coup, the military disbanded right wing and centrist parties as well ...

Such measures were necessary, the military claimed, to enable it to impose harsh deflationary policies 'in the national interest' without organized opposition.

The need for this degree of control resulted, in many countries, in an increased emphasis on 'law and order', and increased expenditures to bolster both police and paramilitary strength to support government in its determination to set in place the necessary changes to ensure long-term economic growth. As Ihonvbere claimed:

The political tensions that have accompanied monetarism have furthered repression, human rights abuses, riots and national disintegration ...

The very high degree of human suffering, disillusionment, anger, alienation, rural decay, urban dislocation, suicides, marital crises, prostitution and crime which have accompanied monetarist responses to the African economic crisis, hold major implications for the potency of ethnicity and the subversion of the goals of nationhood.

(Ihonvbere 1994, p. 51)

The *appearance* of democracy

As tensions have mounted in many countries, governments have felt compelled to increase their coercive authority. Most Third World governments, in the post-cold-war(1) years, have found themselves on the horns of a dilemma. They are being pressured by First World governments and organizations into both deregulation of economic activity, which requires increased coercive authority, and the ratification and implementation of human rights programs and principles.

As Purvis suggested, this has led to a rhetoric in favor of multi-party democracy³⁷⁹ and implementation of human rights programs, accompanied by further politicization of the directive agencies of government.

This increasing politicization of both the police forces and court systems has delegitimised both sets of institutions in the eyes of many people in Third World countries, leading to increasing fear and tension within Third World nations and to further political repression.

The politicization of police forces and courts has been accompanied by the politicization of law, establishing statutes which can be used to legitimize government repression and make it increasingly difficult for individuals and groups to defend themselves against politically motivated criminal charges. As Amnesty International spelt out for the African continent:

There is a developing pattern of human rights violations in parts of Africa in which governments publicly committed to political pluralism adopt methods of curbing domestic opposition and criticism which are designed to minimize the likelihood of international disapproval and to keep their democratic credentials intact.

Certain types of legal charge are proving increasingly attractive to governments seeking to criminalise peaceful political activity or dissent in this new context. These charges include sedition, contempt of court, subversion, defamation, possession of classified documents, and holding meetings or demonstrations without an official permit.

(œAmnesty International 1995)

The reality in many Third World nations since the mid 1990s is that while governments are being pressured to reinstitute multi-party democratic political processes, contradictory pressures coming from the First World, in fact, produce multi-party democratic rhetoric, coupled with the entrenchment of coercive, autocratic government. This has resulted in continuing unrest and rebellion in many Third World countries.

A œTime report spelt out the realities of the first decade of the 21st century,

President Bush is fond of saying that "democracy is on the march" around the world. That's been largely true for the last couple decades, but a new report from the Economist Intelligence Unit says that over the last two years the global trend toward democratization has been stopped in its tracks. Even further, the report suggests the global financial crisis has the potential to start the march moving in the opposite direction:

The results of the œEconomist Intelligence Unit's Democracy Index 2008 confirm that, following a decades-long global trend in democratization, the spread of democracy has come to a halt. Comparing the results for 2008 with those from the first edition of

the index, which covered 2006, shows that the dominant pattern in the past two years has been stagnation.

Although there is no recent trend of outright regression, there are few instances of significant improvement. However, the global financial crisis, resulting in a sharp and possibly protracted recession, could threaten democracy in some parts of the world.

The report also classifies only 30 of the world's countries as being "full democracies," with another 50 countries deemed "flawed democracies." Only 14% of the world's population lives within those countries considered "full democracies."

(^œ[Real Clear Politics October 22nd 2008](#))

Of the post-Cold War 1 years: 

Corruption

Inevitably, when personalized systems of government and leadership, like those found in most Third World nations, are judged against the standards assumed to be commonplace in Western systems of Government ³⁸⁰, they are found to be 'riddled with corruption'. In order to conduct business on a 'level playing field', Western governments and corporations consider it essential to police corrupt practices. At the instigation of Western nations and agencies the ^œ[United Nations Convention Against Corruption](#) has been negotiated, coming into force in 2005. As the United Nations Office on Drugs and Crime explains,

Corruption undermines democratic institutions, slows economic development and contributes to governmental instability. Corruption attacks the foundation of democratic institutions by distorting electoral processes, perverting the rule of law and creating bureaucratic quagmires whose only reason for existing is the soliciting of bribes.

Economic development is stunted because foreign direct investment is discouraged and small businesses within the country often find it impossible to overcome the "start-up costs" required because of corruption.

(^œ[UNODC 2010](#) - accessed 12 April 2010)

Unsurprisingly, corruption appears to be endemic in non-Western nations, but remarkably infrequent in Western nations ³⁸¹.

In order to appreciate the experiences of Third World nations in the post-Second World War period, we need to remember that depersonalized government of the Western kind is unusual and requires understandings of the world which are distinctively Western.³⁸² Where Western understandings don't exist, the forms of government which they require are also unlikely to exist; and where people are required to behave as though Western understandings do exist, there will be many inconsistencies in governmental organization and practice.

Terror

In the last twenty years there have been a number of important changes in international and regional politics around the world. Most obviously, the ideologically fuelled 'Cold War' has ended, with communism and socialism in disarray and capitalism firmly established in the international arena. In the world of the 1990s there was a marked increase in conflicts which were

pronounced to be 'ethnically' inspired, in contrast to those of earlier post-Second World War years, which were usually considered to be driven by commitment to First and Second World ideologies.

The 'ethnic' focus (which largely side-lined Western countries) has, since 2001, been displaced by a diffuse concern with 'terror'. This has led to the United States' promoted 'war on terror' around the world.

Non-Western governments, confronted with ethnic and other challenges inside their territories, could once again trigger military aid from Western countries. All they had to do was to label those with whom they were having difficulty 'separatist terrorist organizations' or claim that they had been 'infiltrated by terrorists' and accuse them of links with 'international terrorism'.

They have been quick to take advantage of Western paranoia, receiving weaponry and military training from Western countries which have largely seen them as the 'front line' in the 'war on terror' ³⁸³. As Rachel Stohl has described,

... the United States has made the "global war on terror" its priority in determining arms transfers and military assistance. In the last six years, Washington has stepped up its sales and transfers of high-technology weapons, military training, and other military assistance to governments regardless of their respect for human rights, democratic principles, or nonproliferation. All that matters is that they have pledged their assistance in the global war on terrorism.

(^œRachel Stohl (2008))

Neoliberalism 🐼

 (28/05/16)

There has also been a technological revolution in worldwide telecommunications networks, with transactions of all sorts now flowing through those networks which governments are decreasingly able to effectively monitor and/ or control. This has been accompanied by a victory for neoliberal economic reformers as advisers to governments and international organizations. ³⁸⁴

These advisers have managed to convince governments everywhere of the need for the privatization of government assets and activities and deregulation of financial markets and currencies, progressively moving control of national fiscal and financial matters from national governments into the international marketplace.

As Rosario Espinal claimed of Latin America during the 1980s, there was a dramatic shift away from developmentalism ³⁸⁵ and towards neoliberal economic and political policies:

... pro-market statements came from different quarters: agencies like the International Monetary Fund (IMF), foreign governments, a growing number of Latin American economists and intellectuals and some segments of the business class ...

In addition to pressure from international agencies to privatize and liberalise the Latin American economies, think tanks and research groups flourished throughout the region in an effort to publicise neoliberal views.

(Espinal 1992, p. 32)

This coincided with a change in the dominant way of 'making money' in the world - through currency, bond and stock trading and financial manipulations rather than through long-term investment in primary and secondary production. This has resulted in primary production, the most important means of income generation for new nations, becoming less and less attractive to investors, since returns on primary production are usually lower and slower - and often far more uncertain - than those resulting from financial manipulations. So, Third World nations are finding it increasingly [difficult to attract and retain investment income](#), making their economies increasingly volatile.

The volatility of international capital investment, focused on short-term gains, means that, in their efforts to retain investment capital, [governments must offer a range of financial inducements, competing with each other](#) to minimize capital flight. Thus, over time, the cost of investment capital increases for those countries least able to afford such costs.

Far from there being true financial deregulation, governments find themselves having constantly to interfere, to prop up their currencies and induce capital to stay. As Gerald Meier presciently described of the financial crises which assailed both Latin American and East and South-East Asian countries in the late 1990s (and which, of course, have threatened the rest of the world during the last years of the first decade of the 21st century):

The Mexican crisis was caused by the volatility of short term capital flows, produced by the unfulfilled market expectations of investors. Today capital flows are dominated by international markets, to the point that domestic autonomy and sovereignty is subordinated to the markets ...

The Mexican crisis or something similar will happen again because it is impossible to keep exchange rates fixed.
(in Morles 1996)

Governments, as a result of these influences, are now faced both by regional and ethnic challenges from within and by international challenges to their authority, independence and economic viability. There is a strong demand for internationalization of economies, allowing the now dominant forces of capitalism increasing entry into, and influence over internal economic activities. This, if and as it is successful, reduces the ability of governments to control economic activity and therefore to plan and implement economic, infrastructural, service, and welfare programs.

On the one hand, governments are increasingly finding themselves at the mercy of international financial and fiscal forces, and on the other, the integrity of the nation-state is being challenged from within. During the first half of 1996, an unremarkable year for ethnic conflicts, there were ethnically or religiously inspired revolts in more than sixty countries around the world. In 2009, though the focus of revolt is claimed to have changed, the frequency of internal challenges to central government authority increased, with more and more non-Western countries teetering on the brink of being [declared 'fragile' or 'failed' states](#)

The Depressing (but realistic) Conclusion 🐼

📅 (03/06/23)

The post-Colonial world of the 21st Century is beset by seemingly insurmountable problems.

Perhaps the most intractable of these is the inheritance by post-colonial nations of anachronistic borders. These were set by Western powers driven, not by the desire to establish new nations, but, by the desire to control as much territory as possible and, with that, to gain exclusive access to the resources of those lands they controlled.

The consequence, for post-colonial governments seeking to accomplish what colonial powers never attempted - the legitimization of political control over national borders and unification of their encapsulated ethnically diverse populations - is continued, and often increasingly intractable, tensions between ethnic communities.

There never was a rationally determined set of colonial policies for ensuring inter- and intra- ethnic tolerance and harmony among the diverse communities of their colonies.

As has often been observed, Western colonies, around the world, were created and administered as though human communities were simply unfortunate impediments to be exploited along with the natural resources which were the true purpose and rationale for colonization.

Post-colonial governments are faced with similar problems to those faced by Ukraine in its post- Soviet attempt to weld together populations which should never have been placed within a common national boundary.

But, of course, those borders, having been established and internationally legitimized, are almost impossible to meaningfully change to ensure long-lasting rational groupings of compatible ethnic communities each within its own national borders.

The upheaval and chaos involved in attempting such a reorganisation of national boundaries in a time when humanity is confronting looming environmental catastrophe (also bequeathed by those colonial powers and their offspring) cannot be addressed without condemning humanity to possible extinction on this planet.

The tensions we have examined in this discussion have not lessened in the first decades of the 21st century. In many cases they have become stronger and more challenging to the viability of Third World national governments.

Governments are being subjected to:

- international pressures from First World governments and non-government organizations;
- demands of the international marketplace and of international organizations and enterprises;
- the demands of electorates which see central, regional and local government as resources to be mined;
- and the tensions associated with competing regional, ethnic and clan-based patron-client networks.

- They are also being pressured by demands from First world countries to control incipient terrorism within their borders and, simultaneously, to prevent refugee flows to Western countries which, in the minds of Western populations, might include individuals and groups seeking to pursue terrorist agendas within First World countries.

These problems, compounded by a range of environmental and economic problems of equal magnitude, make the future of many Third World governments highly problematic. As Rice and Patrick have concluded:

On balance, poorer countries tend to be weaker ones. Poverty fuels and perpetuates civil conflict, which swiftly and dramatically reduces state capacity...

The vast majority of [failed and critically weak] states... have experienced conflict within the past decade and a half. Their security deficits are typically accompanied by weaknesses across the three other core areas of state performance. This is logical, because conflict destroys both formal economies and political institutions. It can also exacerbate poor health conditions, including by facilitating the spread of infectious diseases.

Given a nearly 50 percent risk that postconflict countries will return to war within 5 years, unsuccessful postconflict, peace-building and peacekeeping/stabilization efforts risk condemning countries to renewed conflict or nearly perpetual insecurity and poverty.
(Rice and Patrick 2008)

The world of the 21st century reminds one of Britain in the 5th century AD.

As we've already seen ([The Decay of Western Influence](#)) Britain, in the 5th century, experienced just such turmoil as rival 'kings' battled for ascendancy and neighboring groups, taking advantage of the chaos, invaded the region.

Gildas, a century after the exodus of the Roman legions, provided a graphic description of the chaos which ensued with the waning of Roman influence in Britain,

...neither to this day are the cities of our country inhabited as before, but being forsaken and overthrown, still lie desolate; our foreign wars having ceased, but our civil troubles still remaining.
([Chapter 26](#))

As the empires of Western Europe have crumbled, the institutions in their post-colonial territories, established by them to ensure continuity with the colonial past, have become decreasingly effective. The 21st century has produced its own examples of post-colonial territories suffering turmoil and chaos in the increasing numbers of 'fragile' and 'failed' states which are a growing concern for Western people.³⁸⁶

Many post-colonial territories are in various stages of change. They are slowly, but inevitably, metamorphosing into communities which exhibit similarities with the pre-colonial communities from which they came. Any reassertion of pre-colonial principles of categorization and classification will inevitably be slow and difficult. Over time, forms of organization and interaction will emerge which echo those of the past though they will, of course, not simply replicate past forms.

First, any form which emerges is simply one of a range of possible forms, any or all of which might be generated from the same fundamental

categorical principles. So, even if the same principles were in operation one would find different surface forms over time.

Secondly, the principles themselves are not static, they change through time and the forms of interaction and organization which emerge will reflect such changes.

This has been demonstrated time and again in Third World communities as Western influence has become less dominant.

Chapter 8:
Global economic forces, Western realities:
From Protectionism to Neoliberal Free Markets
Do not go gently into that dark night! 🌑

 (29/01/23)

Global economic forces, Western realities

From Nation States to Privatized, Deregulated World Government

The Regulation - Deregulation Cycle

- Welfare Capitalism and gutted unions
 - Company Towns, Truck Systems, Debt Bondage and Indenture
- Quantitative Easing, Financial Collapse and Protectionism

From Free Markets to Protectionism

- Welfare States and Protectionism
- The relationship between community social templates, resource utilization and constantly escalating productive and consumptive demands
- Loss of subsistence resources
- Wage Labor dependence
 - And, in 2023, The World has a New Population of 'Super-Consumers'
- Free Markets, invaded environments, and snowballing production and consumption
- Free Markets Work: Improving Wages, Conditions and Consumption

The emergence of welfarism: Social costs are Production Costs

- Capitalism and Parasitism
- Community costs are Production costs
- Protectionism
- No Social Welfare for post-colonial nations

The triumph of neoliberalism

- Neoliberalism: A Cure for Economic Stagnation
- Economic Efficiency and the Virtues of De-Regulation
- Economic Activity as Non-Social Activity
- Globalization Lowers Prices, Frees Investment - We're all Better Off!!
- Just-In-Time and Total-Quality-Control: Let's be *flexible* !
 - Do not go gently into that dark night!
- And then We Deregulated Finances and Currencies!
- Transient Benefits of Globalization

Conclusion

➤ Rather than creating costs, both regulation and deregulation shift them... Regulation and deregulation each consists of lower costs for one party and higher costs for the other.

(Samuels & Shaffer 1982, p. 467)

➤ 'Well! I've often seen a cat without a grin,' thought Alice; 'but a grin without a cat! It's the most curious thing I ever saw in my life!'

(Lewis Carroll *Alice's Adventures in Wonderland*)

From Nation States to Privatized, Deregulated World Government 🐦

 (12/04/20) (13/04/20) (16/05/16) (06/04/16)(11/11/18) (12/07/22) (08/02/23) (18/03/23)
(05/08/23) (15/08/23)

In the 21st Century there has been a concerted, coordinated determination to ensure the enduring hegemony of Western Capitalism through establishing a single hegemonic center for the world.

The [vision of Western European nation-states](#) through the 19th and 20th centuries was the globalization of their reach and control.

This ambition, in the 21st century, has matured into a belief that Western Capitalism, in a drive to privatize the world, has evolved.

The 'nation-state' has outlived its usefulness. It was always a means to the true end of capitalism - the denationalized control of the world.³⁸⁷

We might be living in a time defined by a determined drive to privatize the world, but that drive does not come from a coherent policy for governing that privatized world. A major problem for both 'The West' and for the rest of the world is that, as 'Jeremy Grimm' summarizes

Governments and their human minions *serve the perceived short term good of the ever shifting Elite factions* controlling the Government. The often incoherent outcomes of many Government initiatives reflect the incoherence of the Elite factions driving those initiatives. But the outcomes often reflect the broad short term interests of the Elites [my emphasis]

The movement to privatization is also a movement to 'deregulation'. One should not presume that those committed to privatized control of it all are also committed to coordinated 'government' of the world they 'liberate'. Even if (in the unlikely event that) they are 'highly intelligent and focused leaders', they are also, highly motivated by short-term self-interest in a deregulated world of profit driven competitors.

In a world in which neoliberals have finally triumphed we should expect a world driven by 'the perceived short term good of ever shifting Elite factions' - a chaotic world in which [Thoreau's vision](#) is realized:

"That government is best which governs least"; and I should like to see it acted up to more rapidly and systematically. Carried out, it finally amounts to this, which also I believe, - "That government is best which governs not at all"; and when men are prepared for it, that will be the kind of government which they will have. Government is at best but an expedient; but most governments are usually, and all governments are sometimes, inexpedient

In 1991, with the end of the 'Cold War', the United States was confronted by two diametrically opposed alternatives.

It could return to the pre-1940 world of armed forces based on the 'citizen-soldier' model. This presumed a rump military relying on a large, dominant industrial base which could rapidly be refocused (as in WW2) to provide the requirements for any conflict if needed.

or

It could create a new justificatory rationale for maintaining and expanding its armed forces.

Sadly, in the 1990s, it chose the latter option. A draft of a document ('3/13/92') commenting on the US President's 'Defense Planning Guidance 1994-1999' document being circulated for comment explained the possibilities available to the United States, suggesting that its military footprint could be 'reduced':

This Defense Planning-Guidance implements the President's new defense strategy. This strategy guides U.S. security policy and military strategy in a dramatically changed global security environment, one marked by a significant reduction in the resources we will devote to defense and a focus on regional security challenges of concern to us, rather than on the global challenge we faced in the Cold War.

Our strategic position and choices today are very different from those we faced in the past. A fundamentally new situation has been created by the collapse of the Warsaw Pact, the disintegration of the internal as well as the external Soviet empire, and the discrediting of Communism as an ideology with global pretensions and influence.

The United States has responded decisively to reduce its conventional and strategic forces to levels consistent with the promise and uncertainties of the changing environment. The passing global threat challenges U.S. leadership to preserve and strengthen the wide-ranging security relations we have developed over the last forty years with friendly nations and allies, including leading industrial democracies, and to include new democracies of Eastern Europe and the former Soviet Union in a prosperous and democratic "zone of peace." The new international environment also reflects the victory of the United States and its Coalition allies over Iraqi aggression -- the first major post-Cold War conflict.

Our regionally-oriented defense strategy and this Defense Planning Guidance seeks to achieve our national security objectives while facilitating the reduction and restructuring of our defense establishment. As a Nation we have never before succeeded in reducing the defense establishment while retaining necessary capabilities. Our planning should preserve our ability, albeit at lower levels of forces, to shape the future strategic environment -- to foster positive trends and preclude the renewal of major challenges and thereby to avoid having to return to the more costly defense requirements of the past. The choices we make in this more benign international environment will set the nation's direction into the next century.

(⁰⁰[Memorandum for Mr Libby: Subject: Comments Received on Draft DPG - potential Issues](#), Dale A. Vesser, Assistant Deputy Under Secretary (Resources & Plans), United States Office of The Under Secretary Of Defense, 13 March 1992)

But, there were forces in play within the United States' Establishment which would preclude 'reducing the defense establishment while retaining necessary capabilities'.

Stephen Wertheim explained 'the choices' that were made in the 'more benign international environment' facing the United States in subsequent decades:

...[In 1991 T]hree of the men who would become the most influential officials in the George W. Bush administration - Dick Cheney, Colin Powell, and Paul Wolfowitz - were working in the Pentagon to devise a new concept to guide U.S. strategy in the post-Cold War world. Even though the Soviet Union had collapsed, they wanted the United States to keep projecting superior military power across the globe.

In 1992, Powell, then chairman of the Joint Chiefs of Staff, put the objective plainly. The United States must possess "sufficient power" to "deter any challenger from ever dreaming of challenging us on the world stage," he told Congress. "I want to be the bully on the block."

So did Cheney, serving at the time as President George H. W. Bush's secretary of defense. He assigned his deputy, Wolfowitz, to supervise the drafting of the Defense Planning Guidance, a comprehensive framework for U.S. security policy written in 1992. In 46 pages, Wolfowitz and his colleagues explained how to sustain U.S. global dominance in the absence of formidable rivals.

The key, they reasoned, was to think and act preventively. Lacking challengers to balance against, the United States should keep new ones from emerging. It must work to dissuade "potential competitors from even aspiring to a larger regional or global role."

To this end, the United States would maintain a massive military, sized to dwarf all others and capable of fighting two large wars at once. It would retain alliances and garrison troops in every region of the world that Washington considered to be strategically significant. It would, in short, replace balances of power with an American preponderance of power.

In this vision of American hegemony, the United States would be benevolent. It would internalize the core interests of allies and act to benefit much of the world. In formulating its own foreign policy, the Pentagon planners recommended, the United States should "account sufficiently for the interests of the advanced industrial nations to discourage them from challenging our leadership or seeking to overturn the established political and economic order."

U.S. primacy would thereby suppress the security role of U.S. allies as well as adversaries. Every nation, save one, would have nothing to gain and much to lose by building military power of its own. In this way, the United States could stay on top for good, delivering global security at reasonable cost.

(Stephen Wertheim, ["Iraq and the Pathologies of Primacy: The Flawed Logic That Produced the War Is Alive and Well,"](#) *Foreign Affairs*, 17 March 2023)

As Strobe Talbott, President Clinton's 'foreign affairs' advisor, explained in 1992:

The human drama, whether played out in history books or headlines, is often not just a confusing spectacle but a spectacle about confusion.

The big question these days is, Which political forces will prevail, those stitching nations together or those tearing them apart?

Here is one optimist's reason for believing unity will prevail over disunity, integration over disintegration. ...Nationhood as we know it will be obsolete; all states will recognize a single, global authority. A phrase briefly fashionable in the mid-20th century - "citizen of the world" - will have assumed real meaning by the end of the 21st....

...Azerbaijan, Moldova and Czechoslovakia were part of the world's last, now deceased empire [the demise of the USSR]. Their breakup may turn out to be the old business of history, not the wave of the future. National self-assertiveness in the West can be mighty ugly, especially in its more extreme Irish and Basque versions. But when Scots, Quebecois, Catalans and Bretons talk separatism, they are, in the main, actually renegotiating their ties to London, Ottawa, Madrid and Paris.

They are the disputatious representatives of a larger, basically positive phenomenon: a devolution of power not only upward toward supranational bodies and outward toward commonwealths and common markets but also downward toward freer, more autonomous units of administration that permit distinct societies to preserve their cultural identities and govern themselves as much as possible. That American buzz word empowerment -- and the European one, subsidiarity -- is being defined locally, regionally and globally all at the same time.

Humanity has discovered, through much trial and horrendous error, that differences need not divide. Switzerland is made up of four nationalities crammed into an area considerably smaller than what used to be Yugoslavia. The air in the Alps is no more conducive to comity than the air in the Balkans. Switzerland has thrived, while Yugoslavia has failed because of what Kant realized 200 years ago: to be in peaceful league with one another, people -- and peoples -- must have the benefits of democracy.

(Strobe Talbott, [America Abroad: The Birth of the Global Nation](#). *Time*, July 20, 1992)

As we explore the global economic forces shaping present Western realities we need to remember that the implicit aim of the privatization of the world and [erosion of effective national border controls](#) since the mid-1970s has been

the devolution of power not only upward toward supranational bodies and outward toward commonwealths and common markets but also downward toward freer, more autonomous units of administration that permit distinct societies to preserve their cultural identities and govern themselves as much as possible. That American buzz word empowerment -- and the European one, subsidiarity -- is being defined locally, regionally and globally all at the same time.

The [contrived chaos achieved by United States' 'adventures'](#) around the world is not aimed at establishing new, effective, democratic government in invaded territories. It is about creating conditions which will lead to chaos.

[John Judis explained the mindset](#) of the second Bush's coterie of thugs and duplicitous knaves:

...the neoconservatives inside and outside the administration take a radical, even revolutionary, view of what is possible and desirable in the region; they see turmoil as inevitable and desirable.

As Talbott claimed,

The human drama, whether played out in history books or headlines, is often not just a confusing spectacle but a spectacle about confusion. The big question these days is, Which political forces will prevail, those stitching nations together or those tearing them apart?

Henry Kissinger in 1992, displaying a sociopathic willingness to sacrifice others in pursuit of his goals, spelt out the process through which World Government might be achieved:

Today, America would be outraged if U.N. troops entered Los Angeles to restore order. Tomorrow they will be grateful! This is especially true if they were told that there were an outside threat from beyond, whether real or promulgated, that threatened our very existence. It is then that all peoples of the world will plead to deliver them from this evil. The one thing every man fears is the unknown. When presented with this scenario, individual rights will be willingly relinquished for the guarantee of their well-being granted to them by the World Government.

'World government' requires not only privatized financial control of the world's resources and a denationalized police force ensuring the perpetuation of such control but also the devolution of nation-states into administrative regions representing the varied 'ethnicities' encompassed within modern nations.

The regulatory processes and structures which have legitimized those nations and restricted and disrupted the free flow of capital around the world must be removed and replaced by truly international powers and structures. These must reach right down to the smallest socio-political groupings of people.

Just as, in their day, European nation-states controlled their empires by establishing well-armed colonial administrations, so world government will require similar control of regions and populations.

But, for all this to happen, first, populations must become disenchanted with the performance of their national governments. National governments must be shown to be incapable of truly maintaining 'law and order' and guaranteeing the safety, well-being and prosperity of their peoples.

As Kissinger explained

America would be outraged if U.N. troops entered Los Angeles to restore order. Tomorrow they will be grateful! This is especially true if they were told that there were an outside threat from beyond, whether real or promulgated, that threatened our very existence. It is then that all peoples of the world will plead to deliver them from this evil. The one thing every man fears is the unknown. When presented with this scenario, individual rights will be willingly relinquished for the guarantee of their well-being granted to them by the World Government.

First, privatize national 'assets' then weaken and remove the regulatory powers which legitimize and empower national governments, defanging the 'sovereignty' of nation states around the world.

Next, ensure that hegemonic supranational powers and structures are in place to restore law and order as nations descend into chaos.

Then, with those governments no longer able to effectively ensure the wellbeing of their peoples, introduce 'real or promulgated' threats to those populations - in the vernacular: 'scare the hell out of them'!

The chaos introduced to invaded nations through the past half century and more of US instigated 'regime change' activity around the world is less a consequence of ineptitude than design!

The Cheneys, Powells, Wolfowitzs, Kissingers and Talbotts of this world are real, their enablers exist and already, behind the scenes, have gained power over political parties and politicians. In the United States, the center of this movement to control the world, 'moneyed interests' have already been legitimized.

Lydia Saad explained:

Americans' broad views about corporate spending in elections generally accord with the Supreme Court's decision Thursday that abolished some decades-old restrictions on corporate political activity. Fifty-seven percent of Americans consider campaign donations to be a protected form of free speech, and 55% say corporate and union donations should be treated the same way under the law as donations from individuals are. At the same time, the majority think it is more important to limit campaign donations than to protect this free-speech right.

(Lydia Saad, [Public Agrees With Court: Campaign Money Is "Free Speech"](#), *Gallup*, January 22, 2010)

There is little 'new' in all this. Empires have, as a rule, employed [Divide and rule](#) policies to control subjugated peoples.

The Regulation - Deregulation Cycle

The problem since 2009 is '[sovereign debt](#)' ³⁸⁸.

As [fachidiot experts](#) have 'explained' to the capitalist world, Western nations have 'profligately' continued to fund social welfare measures - such as aged pensions, free health care, free education, unemployment benefits, child and family support, poverty alleviation ... - as though they still lived in a regulated and protected world.

But the world has been deregulated, protection has been traded for globalization ³⁸⁹. Sovereign debt sustainability has become an increasingly serious issue in advanced economies ³⁹⁰.

The social welfare component built into production and financial sector costs in Western nations is disappearing. Like the Cheshire cat, we are left with little but the grin! Deregulation has shifted the costs from 'the economy' to sovereign debt.

Western nation-states, once firmly in control of economic activity within their borders are, in the deregulated, privatized world of the 21st century, decreasingly able to shield their populations from the exploitative consequences of unregulated and internationalized financial manipulation ³⁹¹.

No longer is the economy the means by which communities meet their needs and wants. Now communities service an international network of

independent financial corporations which need accept no reciprocal responsibilities for their welfare.

The surprise displayed by so many 'financial experts' in the first decade of the 21st century, at the failure of the highly suspect investment, lending and 'risk management' strategies of major Western financial enterprises; and the subsequent need for bailout via increases in 'sovereign debt', requires the questions:

- ★ How is it that we, Western people, could be held to ransom by international financial corporations?

and;

- ★ Why weren't they alerted by the financial woes experienced in the so-called 'Tiger' economies of the 1990s ³⁹² and so prepared for the problems of the last several years?

The answer seems to be that they believed that Western nations were immune to the problems visited upon non-western countries in previous decades. Despite the chequered financial history of Western nations over the past century, the experts ³⁹³ appear to have convinced themselves that Western nations had finally been insulated from serious bank/financial failures of the kind periodically endured in the rest of the world.

We need to remind ourselves of our own past and relearn its lessons.

In order to understand how we got to our present position, we need to understand the historical/philosophical underpinnings of both the protectionist and neoliberal approaches to social and economic organization and activity.

In doing this, we will examine and historically contextualize:

- ★ the growth of welfare capitalism in the 1920s;
- ★ the emergence of the 'welfare state' in the 1930s;
- ★ the progressive
 - privatization, from the 1970s, of the welfare state ³⁹⁴ ;
 - emphasis on 'user pays' versions of welfare;
 - and the subsequent unsustainability of residual publicly funded social welfare costs; and
- ★ the neoliberal drive to deregulation and globalization of market activity in Western communities over the past forty years.

The financial shocks of the past several years in Western countries have alerted people who live in these countries to the fragility of the financial environment upon which they depend for present wellbeing and future security.

Western people are beginning to understand what people in the rest of the world have endured over the past forty years: fragile economies, unstable currencies, volatile investment environments and, when everything is on the verge of collapse, harsh structural adjustment programs ³⁹⁵ devised

and prescribed by international agencies such as the World Bank and the International Monetary Fund.

Similar financial crises have been experienced in Third World ³⁹⁶ countries at regular intervals since the 1970s. The recent crisis pales in comparison with the financial and fiscal problems endured in Asian, Central/South American and African countries between 1990 and 2000.

In an assessment of the East and South East Asian financial collapse of 1997-8 which reminds one of recent experiences in Western countries, Janet Yellen (2007), President and CEO, Federal Reserve Bank of San Francisco, explained that,

In spite of the risky lending practices that prevailed before the crisis, foreign investors poured money into these countries at record rates. Their willingness to do so appears to have stemmed in part from ... a perception that the governments of these nations stood ready to intervene to forestall bank failures.
(^œYellen 2007)³⁹⁷

A major problem for Third World countries is that they have always been in the periphery of the global economic system, never able effectively to address the core issues which have threatened long term economic well being. So long as the problems they endured did not significantly affect life in Western nations, there was little likelihood of those issues being addressed.

Western nations have consistently reacted to periodic financial failures only to the extent that they have threatened the wellbeing of 'responsible' people in Western countries. Attempts at regulating international fiscal/financial organization and activity over the past century have all appeared in reaction to problems encountered in Western economies.

In this discussion we will explore the experiences of the West which have provided a blueprint for changes in economic organization and practice in Third World countries. In a later discussion we will explore the experiences of Third World countries as they have been required to follow Western economic fashion shifts.

The 1929 Wall Street collapse, following the neoliberal 1920s, produced the first major national initiatives in the USA to ensure that risky lending practices of banks could no longer threaten the economic stability of the nation (and, by extension, the world economic system based in Western nations).

Prior to this collapse, as the US Federal Deposit Insurance Corporation (FDIC 1984) described, the US, along with most other Western nations, had experienced periodic financial failures over more than a hundred years. Measures employed to counteract and insulate against such failures were *ad hoc* and never effective over the long run.

It seems that regulatory authorities in Western nations are unable to maintain and adapt regulatory measures taken in reaction to crises once they have been mitigated. The FDIC, itself, established by the Roosevelt administration in 1933 to 'reduce the economic disruptions caused by bank failures', has been accused of being a toothless tiger in the 1st decade of the 21st century.

Once the initial shock of a financial failure passes, and measures introduced seem to have dealt with the problem, those authorities responsible for

ensuring against future financial failures become decreasingly effectual. The measures introduced to handle particular failures become less appropriate over time as marketplace strategies alter to circumvent them, until they no longer safeguard against failure, and the problems resurface.

Effectively, what we have in the historical record is a process of moving from

- crisis;
- to regulation;
- to progressive weakening/circumvention of the regulations;
- to deregulation³⁹⁸ ;
- ⬆ to crisis

The official history of the US Federal Deposit Insurance Corporation (FDIC) explained this in a 1984 publication outlining its establishment and operation during its first fifty years³⁹⁹.

Welfare capitalism and gutted unions 🐞

The 1929 crash followed a decade during which regulations which had been enacted over the previous forty years had been progressively weakened to allow uninhibited market activity to flourish.

Following the First World War, left leaning 'radicals' and trade unions were successfully challenged and sidelined by employers and state officials. Gerald Friedman (2008) has summed up their experiences over the 1920s decade well.

The 1920s was an especially dark period for organized labor in the United States where weaknesses visible before World War I became critical failures. Labor's opponents used fear of Communism to foment a post-war red scare that targeted union activists for police and vigilante violence.⁴⁰⁰

Factory automation and assembly line organization were refined and extended during the war years. This, following the war, resulted in excess productive capacity which, with the influx of people looking for work as troops returned from the war, resulted in a short sharp urban recession in 1920-1.

Raymond Betts (1979) described similar problems in Western Europe,

For millions of war veterans readjustment to civilian life was an immense problem. The search for jobs, the attempt to repair marriages disrupted by years away from home, the bitterness over reports of war profiteering, and the disappointment over the shortages of housing were personal difficulties quickly dampening the enthusiasm for the long sought-after peace.

In the US, this resulted in a sharp increase in unemployment which quickly grew to more than 11% of the workforce. The unemployment problem was compounded by the large numbers of women who had entered the workforce during the War years and wished to continue working⁴⁰¹. These conditions, as Friedman has described, greatly helped employers and their organizations in neutralising union strike activity.

The US Commerce Secretary, Herbert Hoover (elected president in 1928), successfully argued for an expansion of the money supply, weakening of investment strictures and an increase in urban wages as a means of stimulating mass consumption to match the increasing productive capacity. This had the desired effect and urban areas of the United States experienced a period of rapid economic growth, fuelled by the newly stimulated era of mass consumption (see '[deregulation leads to economic growth and wellbeing](#)' for consequences).

Having neutralized workers' unions, businesses, in a time when they were flush with profits from the developing boom conditions, sought to make unionization irrelevant. They did this by following the worker welfare practices refined by Henry Ford during the 1st World War, incorporating 'welfare capitalism' into their staffing strategies⁴⁰². These practices had a long history in western Europe and would have a similar history in Western Europe's colonies through the late 19th and 20th centuries.

[Company Towns, Truck Systems, Debt Bondage and Indenture](#)

During the 19th century, socially aware business owners, conscious of the appalling working conditions in most major industrial centers in Western Europe had attempted to improve the lot of workers and their families. A number of examples of 'company towns' emerged, such as New Lanark in Scotland built by Robert Owen; Pullman on the outskirts of Chicago built by George Pullman⁴⁰³; and McDonald in Ohio, built by the Carnegie Steel Company.

The emergence of company towns and similar forms of welfare capitalism might, very often, have been well intentioned and for the benefit of employees. Welfare capitalism was, of course, an effective means of ensuring employee loyalty and keeping employee organization under control. An employee organization which was contained within a company and relied on company welfare programs could be insulated from worker organizations elsewhere.

All-too-often these attempts at ensuring the welfare of workers degenerated into truck systems⁴⁰⁴, debt bondage, peonage and indenture⁴⁰⁵. Such practices had been commonplace forms of worker exploitation from the 17th century. They had been formalized in English law with the passing of the ^{ca}1601 Poor Laws.

Merle Travis expressed it well in a mid 20th century folk song,

You load sixteen tons, what do you get?
Another day older and deeper in debt.
Saint Peter, don't you call me, 'cause I can't go;
I owe my soul to the company store⁴⁰⁶.

Daniel Gross (2004) has neatly summed up the move to welfare capitalism in the 1920s⁴⁰⁷.

Henry Ford led the way. In January 1914, Ford Motor Co. instituted the \$5 day. Over the next several years, Ford took steps to ensure that its employees remained healthy, loyal, and above all, efficient. It opened an infirmary and established the "Sociological Department" to both keep tabs on and look after the welfare of its workers. In 1922, Ford cut the work week from six days to five.

In the roaring 1920s, when other highly profitable companies began to emulate Ford, welfare capitalism began in earnest. Companies built

cafeterias and health clinics, sponsored baseball and bowling leagues, and granted days off for the opening of deer season. Corning Glass Works began providing health insurance in 1923. The same year, U.S. Steel slashed its workday from 12 hours to eight. In 1927, International Harvester began offering two-week paid vacations. All this was all done without government mandates and largely without the influence of unions.

 (07/04/16)

The 1920s was a decade of 'welfare capitalism', in which employers took paternal responsibility for their employees.

It seemed to employed urban inhabitants that the prosperity of the era was a consequence of:

- the weakening of union power;
- weakening of public legislation on speculative investment;
- and commitment by businesses to the welfare of their employees.

It was believed that these were responsible for both the strong growth in urban incomes and improvement in urban living conditions ⁴⁰⁸.

The United States urban employed experienced growing incomes (almost 20% real increase over the period) coupled with falling commodity prices as a consequence of the new mass production technologies and electrification of industry.

American middle and working classes began a love affair with private enterprise and material possessions which has lasted to the present.

But, there were losers. The prosperity of the decade did not extend into the rural populations of the United States, and there were many members of minority groups - such as a growing population of African Americans moving from the impoverished rural south into northern, mid-western and western cities - who had to settle for low paid service employment or could not get work and found life harsh in a deregulated world.

By the end of the decade, the euphoria of the period evaporated, the [illusory wealth created by a speculative investment bubble vanished](#), hundreds of thousands of people lost their savings and millions of urban workers lost their jobs.

It was another in the list of economic bubbles which seem to be an inevitable result of neoliberal free market policies. And, like other bubbles before it ⁴⁰⁹, and a few since, it burst!

President Franklin D. Roosevelt summed it all up:

For twelve years this Nation was afflicted with hear-nothing, see-nothing, do-nothing Government. The Nation looked to Government but the Government looked away. Nine mocking years with the golden calf and three long years of the scourge! Nine crazy years at the ticker and three long years in the breadlines! Nine mad years of mirage and three long years of despair! Powerful influences strive today to restore that kind of government with its doctrine that that Government is best which is most indifferent.

For nearly four years you have had an Administration which instead of twirling its thumbs has rolled up its sleeves. We will keep our sleeves

rolled up.

We had to struggle with the old enemies of peace - business and financial monopoly, speculation, reckless banking, class antagonism, sectionalism, war profiteering.

They had begun to consider the Government of the United States as a mere appendage to their own affairs. We know now that Government by organized money is just as dangerous as Government by organized mob.

(œFranklin Roosevelt's Address Announcing the Second New Deal, October 31, 1936)

And, in 1933, faced with an imminent collapse of the US Banking system:

To review at this time the causes of this failure of our banking system is unnecessary. Suffice it to say that the government has been compelled to step in for the protection of depositors and the business of the nation.

(President Franklin D. Roosevelt to Congress March 9, 1933)

Compare the response in 1933 to this response by President Barack Obama following the 2008 Wall Street collapse which followed a neoliberal revival over the previous thirty years:

... we don't have any kind of process designed to contain the failure of a Lehman Brothers or any of the largest and most interconnected financial firms in our country.

That's why, when this crisis began, crucial decisions about what would happen to some of the world's biggest companies - companies employing tens of thousands of people and holding hundreds of billions of dollars in assets - had to take place in hurried discussions in the middle of the night. That's why, to save the entire economy from an even worse catastrophe, we had to deploy taxpayer dollars.

(President Barack Obama *Cooper Union Speech* April 23, 2010)

Quantitative Easing, Financial Collapse and Protectionism 🐼

The decade of the 1920s was shaped by the combined effects of

- ★ expansion in the money supply ⁴¹⁰ ;
- ★ the streamlining and electrification of production;
- ★ consequent mass production of cheap consumables;
- ★ a deliberate decision to encourage spending;
- ★ and unregulated speculative investment and lending⁴¹¹.

These, together, produced their inevitable result - the 1929 financial crisis.

While 1929 marked the beginning of the end, the effects of the crisis emerged over the next four years. With loss of confidence in the future, businesses and individuals reined in their spending, banks became increasingly reluctant to fund the continued reliance on easy credit, and a downward spiral commenced which would end, as the FDIC report described, in bank failure, a freeze on investment, and subsequent massive unemployment.

From the stock market crash in the fall of 1929 to the end of 1933, about 9,000 banks suspended operations, resulting in losses to depositors of about \$1.3 billion. The closure of 4,000 banks in the first few months of 1933, and the panic that accompanied these suspensions, led President Roosevelt to declare a bank holiday on March 6, 1933. The financial system was on the verge of collapse, and both the manufacturing and agricultural sectors were operating at a fraction of capacity.
(œFDIC 1984)

 (09/07/18)

By 1933, unemployment in the United States had risen to 25% of the workforce. Close to 13 million people were unemployed. And, of course, the 'welfare capitalism' of businesses collapsed. Those who retained their jobs, found that they were powerless. Company workers' associations provided no protection against loss of conditions as businesses cut costs to stay afloat.

The unemployed found themselves on their own, without access to any of the welfare facilities they had taken for granted over the previous decade. There was no "welfare safety net" to which the newly destitute could turn. And the problems of the decade would not be short-lived ⁴¹².

It was inevitable that a dispossessed democratic electorate would demand protection from its government. And that was what happened in the U. S. federal election of 1932. ⁴¹³

From Free Markets to Protectionism

 (22/11/16) (20/06/18) (05/05/20)

There is something fundamentally unstable about a deregulated neoliberal, free market economic order.

There has long been a belief in the US that 'free markets' are unregulated markets. Any attempt at regulation has simplistically been considered a move toward socialism ⁴¹⁴. Attempts to provide a stable backdrop to economic activity through regulation have been considered inherently 'anti-free-market' ⁴¹⁵.

The presumption that free markets are best when unregulated depends on a claim, first made by Aristotle and reiterated by Aquinas in the 13th century, that civilization is based on people ordering their lives by instincts implanted in each individual ⁴¹⁶. If one accepts Aquinas's logic, then those instincts, having been implanted by God who makes all things perfect, must, in their expression, produce a perfect individual and a perfect society. Without this metaphysical presumption, there really are no grounds for assuming that the expression of uninhibited human nature will produce the *Summum Bonum* - or greatest good ⁴¹⁷.

Those who argue for government regulation to ensure a stable legislative background to economic enterprise are assuming that an unregulated market place is not a recipe for either perfect individuals or societies. They are, implicitly, questioning Aquinas's logic. Many who feel the need for public regulation of private economic practice, presume that unregulated markets will result in a world in which 'the devil takes the hindmost'; where the unscrupulous manipulator is given free rein ⁴¹⁸.

In an unregulated world, governments can only react to problems after they occur. The capacity to proactively regulate financial behavior through time to ensure long-term economic stability is removed. This anarchic form of libertarianism has become dominant in US neoliberal thought in conjunction with a resurgence of religious fundamentalism.

In 1932 Franklin D. Roosevelt, in response to the demands of a disenchanted electorate, promised them a 'New Deal'. His government would introduce a range of measures to address the current economic problems and protect people from such disasters in the future ⁴¹⁹.

The New Deal provoked a storm of protest from those who believed in free markets, independent individualism and small government. They developed and prosecuted a claim that the prolonged difficulties of the 1930s were due, not to the unwise policies of the 1920s but to the 'collectivist', 'socialist' policies of the New Deal government ⁴²⁰. According to these protestors, the evils of the 1930s were due to the leftist sympathies of politicians who promoted big government, the regulation of private enterprise, and 'social welfare' policies which weakened the moral fiber of the nation ⁴²¹.

As we will see, the measures introduced to address the problems of the period faced concerted challenge in the courts and fired an opposition which would prosecute its case over the next 40 years. With the emergence of economic difficulties from the late 1960s onward, that opposition would finally gain traction and neoliberal policies would successfully be promoted.

The depth of the 'Great Depression' provided the political leverage that Roosevelt needed to over-ride concerted opposition from both free marketeers and fellow-travelers. Between the early 1930s and the middle to late 1970s, most Western governments promoted protectionist, 'developmentalist' policies aimed at harnessing economic activity to national and community needs. Governments limited and directed market activity through imposing rules and regulations on imports and exports and on fiscal and financial activity. We will examine these developments in the next section.

From the mid-1960s, as the post 2nd World War economies of Western nations reaped the consequences of an overheated 1950s economic boom, neoliberal arguments were increasingly successful in challenging the legitimacy of the protectionist legislation of the period.

 (01/10/17)

Neoliberalism places the market at the center of 'development'. The presumption is that **if the state privatizes as much of its activity as possible**, making it directly answerable to 'market forces', and deregulates fiscal and financial activity, market forces will ensure rational, efficient economic organization and activity. This will, in the long-run, result in a more rational organization of society, to the benefit of its members.

A fundamental presumption underpinning neoliberalism is that all cultural and social forms are derivatives of individual, competitive, acquisitive behavior, which is fundamental to human nature ⁴²². So, social change is driven by competitive individual exchange. Uninhibited market exchange most directly expresses that human nature. Therefore, by subjecting communities to 'market forces', one introduces rational social change.

The burning question in this 21st century is, of course:

The OECD, in 2018, has published a report on the rise in inequality within member countries over the previous neoliberally driven 25 years entitled *A Broken Social Elevator? How to Promote Social Mobility*. As Gabriela Ramos has explained in the foreword:

The OECD has been at the forefront of documenting the rise of inequality for several decades. The data paint a stark picture: the average disposable income of the richest 10% of the population is now around nine and a half times that of the poorest 10% across the OECD, up from seven times 25 years ago. Wealth inequality is even more pronounced, with the top 10% holding half of total wealth, while the bottom 40% holds only 3%. The financial crisis reinforced these trends, but inequalities still increased and the benefits of growth still mainly benefited the top of the income distribution in OECD countries even during the highest periods of global economic expansion before 2008. In many emerging and developing countries, inequalities remain large despite significant poverty reduction.

We have long emphasised the multi-dimensional nature of inequality. Socio-economic status heavily influences employment prospects, job quality, health outcomes, education, and the other opportunities (including access to relevant networks) that matter to people's well-being. Children whose parents did not complete secondary school have only a 15% chance of making it to university compared to a 60% chance for their peers with at least one parent who achieved tertiary-level education. Disadvantage at the outset can follow children throughout their life. Educational disadvantage typically means not only smaller salaries, but, most worryingly of all, shorter lives. A 25 year-old university-educated man can expect to live almost eight years longer than his lower-educated peer on average across OECD countries; the difference is 4.6 years for women.

The vicious confluence of poor educational opportunities, low skills and limited employment prospects can trap people in situations where they are also far more likely to be exposed to environmental hazards and violence. As a result of this multidimensional inequality, while some individuals, cities and regions thrive, others fall further behind... (Michael Fôrster *et al*, ^œ[A Broken Social Elevator? How to Promote Social Mobility](#), OECD, 15 June 2018)

It has been in the context of this deregulation of national economies, and the facilitation of international economic activity that the present global economy has emerged. In order to understand how we got to our present position, we need to understand the underpinnings of both the protectionist and neoliberal approaches to social and economic organization and activity.

Welfare States and Protectionism

To contextualize the discussion we need briefly to examine:

- ★ community social templates;
- ★ resource utilization;
- ★ the constantly escalating productive and consumptive demands of Western communities;

- ★ the emergence of what, in the West, came to be called the welfare state;
- ★ and some of the reasons for the imposition of protectionist legislation on economic activity.

This provides a platform for understanding the post-1970s demand for the lowering of protectionist barriers to market activity which characterises the neoliberal economic reorganization of the past half-century.

The global economy which has emerged has been based on a progressive removal of national governmental restrictions on international market activity. We will examine some of the demands made for the internationalization of market activity over the period and some of the consequences of unregulated, international market exchange for both First and Third World communities.

It became accepted during the 1930s in Western countries that people were wholly dependent on wage labor for their livelihood. They no longer had access to the resources needed for a subsistence lifestyle. It was decided that, in order to cushion the effects of loss of employment, and therefore income, the state should accept some responsibility for their social welfare if they lost employment.

On the other hand, those responsible for policy development and implementation in colonial territories considered that people in non-Western communities, if they lost employment, could return to their home communities and depend on subsistence resources for their livelihood.

These variant presumptions have led to some of the most important strains and stresses on both Western and non-Western communities in the past thirty years. So, it is necessary to understand both the rationale and the consequences of this belief in the continued existence of viable subsistence alternatives for non-Western people.

The relationship between community social templates, resource utilization and constantly escalating productive and consumptive demands 🐘

Prior to European intrusion, most non-Western people lived in subsistence oriented communities ⁴²⁴. Economic activity was focused on the provision, by its own members, of most of the goods and services required by the local community, and that community accepted responsibility for the well-being of its members.

Trade was usually limited to a few products or raw materials not directly available to the community. It was often focused directly on the circulation of status-related goods and was not central to the supply of everyday needs and wants.

As has been outlined, in most communities the material requirements of individuals and groups have been *socially circumscribed* and fit the productive potential of the environments they inhabit. So, over long periods of time, such communities have been able, in all but very adverse physical conditions, to meet most of their needs from their own environments.

Western Europeans, on the other hand, became involved in material production and in the consumption of goods and services for very different reasons.

Western European social templates focus directly on the production and consumption/accumulation of goods and services. They are economically oriented. They are also focused on individual competitive opposition, on what economists call 'market activity' ⁴²⁵.

Where individuals gain status and respect through the competitive accumulation and consumption of goods and services ⁴²⁶, the supply of goods and services in the community is inherently inflationary. Those items which are in shortest supply, but in greatest demand, become the most highly 'valued', that is, the most important in determining relative status.

Since people are involved in individualized competitive accumulation and consumption, there is constant pressure to produce increasing quantities of goods to feed the acquisitive and consumptive appetites of community members. There is, therefore, constant pressure being placed on current productive techniques and technologies, since the requirements placed on current technologies are constantly escalating.

Producers who are able to improve productive efficiency through more 'economic' use of their resources, through streamlining production techniques, and through improving technology, gain a competitive edge over their rivals.

The consequences of this drive are that techniques and technologies are constantly being improved and refined to enable constantly increasing production; constantly increasing exploitation of the environment; and constantly decreasing materials and production costs.

Community resources are placed under constant pressure. They are in short supply, or, as economists are wont to remind us, they are 'scarce'. As such, they become increasingly 'valuable' and therefore become desired possessions in the drive for status and respect. This, in turn, leads to their accumulation by those with the wealth and power to appropriate them ⁴²⁷.

Loss of subsistence resources

In early modern Western Europe this led to land enclosure and the dispossession of increasing numbers of rural dwellers. (In colonial territories, people were moved from their traditional environments to native reserves of marginal agricultural usefulness) ⁴²⁸. The poor of Western Europe were forced, by their loss of subsistence resources, to become poorly paid rural laborers or to migrate to the towns where they might be able to live by their wits or, if they were lucky, find paid employment. [Thomas More](#) described this kind of dispossession in 16th century England well:

[T]he owners as well as tenants are turned out of their possessions, by tricks, or by main force, or being wearied out with ill-usage, they are forced to sell them.

By which means those miserable people, both men and women, married and unmarried, old and young, with their poor but numerous families (since country business requires many hands), are all forced to change their seats, not knowing whither to go; and they must sell almost for nothing their household stuff, which could not bring them much money, even though they might stay for a buyer. When that little money is at an end, for it will be soon spent, what is left for them to do, but either to steal and so to be hanged (God knows how justly), or

to go about and beg? And if they do this, they are put in prison as idle vagabonds ⁴²⁹.

Land became unavailable to most members of the community for subsistence lifestyles. It had become incorporated into the social template as one of the possessions through which people could attain and maintain status. As such it had to be 'owned' by the individual rather than by the community, and the individual had to limit the possibility of others enhancing their statuses through its use. That is, laws of trespass became inevitable ⁴³⁰.

Losing access to subsistence resource bases, people had to rely on cash income both to ensure subsistence and to maintain and enhance their social statuses. Poverty became defined not only in terms of loss of access to subsistence resource bases, but also in terms of the ability to maintain the levels of accumulation and consumption of goods and services which were required for the social statuses which people had attained. The 'success' of individuals could be determined by the cash income available to them, or by the cash value of their holdings.

Wage Labor dependence 🐼

In Western communities, increasing numbers of people could only maintain their statuses and satisfy their expanding needs through wage labor. As Marx observed in the mid 19th century, the only saleable commodity left to many individuals was their ability to labor.

They became compelled by both their subsistence and status-related needs to sell their labor power to those who controlled the means of production. And, since labor power became another source of wealth and therefore of status, it was used as all other resources were used, to increase the wealth of those who controlled it - to produce the maximum output for the minimum input.

Human beings became commodified ⁴³¹, another resource which might be bought and used to maximize profit.

With labor in plentiful supply and employment difficult to find, employers could reduce labor costs and make it more pliant through challenging social restrictions on the exploitation of labor. During the 17th to early 20th century, this ensured that both living and working conditions for the 'laboring poor' were harsh.

The influential people of Western communities, since the 17th century, have been capitalists ⁴³². Since they were oriented to maximizing profits and minimizing costs, it soon became argued that all forms of social interference in the marketplace of labor should be removed.

As Joseph Townsend ^{œ(1786)} argued in the late 18th century, labor should be made directly available, without social impediments, through the marketplace. People should be 'freed' from social 'restrictions' on their 'right' to sell their labor power to the highest bidder and businesses should be 'freed' from 'political interference' to engage labor at 'market prices'.

Of course, in a period of plentiful labor, market forces ensured that such prices would be very low ⁴³³. Inevitably, given that the drive of capitalism is to lower costs and increase profits, employers and owners of business colluded to keep costs of labor down.

Adam Smith described the realities of 'combination' as employers combined to further their interests during the 18th century, in his most famous work *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776). The description he gives is as applicable throughout the capitalist world now as it was then. It is an explanation which has received much less attention than it deserves through the past 200 years.

...Whoever imagines... that masters rarely combine, is as ignorant of the world as of the subject. Masters are always and everywhere in a sort of tacit, but constant and uniform combination, not to raise the wages of labor above their actual rate.

To violate this combination is everywhere a most unpopular action, and a sort of reproach to a master among his neighbors and equals. We seldom, indeed, hear of this combination, because it is the usual, and one may say, the natural state of things, which nobody ever hears of. (1776, p.84) ⁴³⁴

From the 16th century onwards, the emerging legal framework of economic relations was always biased toward those who increasingly controlled the law courts of Western Europe ⁴³⁵. 'Masters' increasingly used their privileged access to the law courts of Western Europe to advantage themselves at the expense of both the 'rural' and 'laboring' poor.

Where people lose access to their subsistence environments and become entirely dependent on wage labor for the supply of their needs and wants, loss of employment leads to both socially-defined and absolute poverty. The history of the emergence of capitalism in Western Europe is, simultaneously, the history of endemic poverty for large numbers of displaced people who were compelled to sell their labor power on the open market ⁴³⁶.

The improvement in the quality of life of Western European wage laborers coincided with the expansion of Western Europe into the rest of the world.

Free Markets, invaded environments, and snowballing production and consumption 🇺🇸

 (01/05/23)

The world which Western European colonial powers set out to reorganize in the late 19th and 20th centuries was already organized *to provide inhabitants* with their needs and wants. Europeans did not move into empty regions. They dispossessed inhabitants of their lands and resources, and compelled the populations either directly or through a variety of subterfuges to supply the labor they required ⁴³⁷.

The planet was being reorganized to ensure that the needs and wants of Western people could continue to expand. The story of the rest of the world, since the late 19th century, is bound up in its progressive co-option to continue feeding the expanding appetites of the West.

Regions became devoted to 'mono-agricultural' export, to large-scale production of a very few primary commodities for export, rather than for the communities whose environments were reorganized ⁴³⁸. Where mono-agricultural development in large holdings was not feasible, indigenous communities were re-organized to emphasize cash-cropping, producing agricultural products required for European markets on small-holdings.

And, in 2023, The World Has a New Population of 'Super-Consumers' 🌐

Snowballing consumption and its corollary, snowballing production and raw materials demand, appear to be as addictive in China as they have been in the United States of America.

On April 30, 2023, the Chinese *Global Times* published an article describing China's seduction by and descent into 'mass consumption':

A tourist who arrived at Sanxingdui Museum in Southwest China's Sichuan Province at 8 am, ahead of the opening, queued for more than one hour to enter, which was an vivid miniature of the first day of the May Day holidays on social media platform Xiaohongshu.

Such travel mania was seen nationwide on Saturday, the first day of the five-day holidays. Air, sea and land passenger traffic surged 151.8 percent year-on-year on Saturday, latest statistics revealed. ...

Driven by resurgent enthusiasm for travel, China's consumer market boomed sharply during the holidays.

China's key retail and catering enterprises saw sales growth of 21.4 percent year-on-year on Saturday, according to the monitoring of the Ministry of Commerce (MOFCOM) released on Sunday.

Catering and leisure consumption increased significantly, with sales of key catering enterprises up 36.9 percent on a yearly basis. Sales of clothing, shoes and hats, gold, silver and jewelry, tobacco and alcohol all increased by about 20.9 percent, 17.6 percent, 17.4 percent and 16.8 percent, all on year-on-year basis, MOFCOM data showed.

In particular, on-site consumption saw a significant growth during the May Day holidays.

On Saturday, the box office reached 294 million yuan, with 464,000 screenings attracting an audience of 7.26 million, according to statistics sent to the *Global Times* on Sunday from Maoyan, a box-office tracking site.

The number of buyers to Suning's stores across the country on Saturday increased by 32 percent year-on-year, with the volume of orders spiked 47 percent, Chinese retailer Suning said in a note sent to the *Global Times* on Sunday.

(^œ[First day of May Day holidays witnesses record railway trips, booming consumer spending, *Global Times*, April 30, 2023](#))

May that Being (or Beings) to which humanity so readily appeal(s) when it is facing disaster show us a way out of the 'consumption-production-resource stripping-trap' in which human beings so willingly become ensnared!

Free Markets Work: Improving Wages, Conditions and Consumption

The influx of new raw materials from non-Western regions in the last quarter of the 19th century ushered in a prolonged period of growth in commodity production in Europe. This, in turn, fuelled consumption in Western countries. At the same time, the expansion into the rest of the world required rapid growth of both armed forces and colonial administrations. These developments, of course, increased labor requirements and labor, in Western countries, became relatively scarce.

Now, for the first time, market forces led to an improvement in wages and conditions for laborers. Wage laborers in Western nations could begin to negotiate better employment terms ⁴³⁹. Unions became increasingly powerful since their members were not threatened by loss of employment if they insisted on improvements in their wages and conditions.

It also gave credibility to the claims of 'free marketeers' that 'free'⁴⁴⁰ competition would, inevitably, result in improved lifestyles for those who entrusted their lives to 'market forces.'

Thomas Huxley (1893) described the position of free marketeers in the second-half of the 19th century:

According to their views, not a shilling of public money must be bestowed upon a public park or pleasure ground; not sixpence upon the relief of starvation, or the cure of disease.

...The State is simply a policeman, and its duty is neither more nor less than to prevent robbery and murder and enforce contracts. It is not to promote good, nor even to do anything to prevent evil, except by the enforcement of penalties upon those who have been guilty of obvious and tangible assault upon purses or persons.

(1893, p. 258) (See [Thomas Huxley](#) for more on this)

The prolonged economic difficulties of the last quarter of the 19th century ⁴⁴¹ did little to dent this belief in the efficacy of market forces. They did, however, strengthen the determination of workers' organizations to have legislative protections put in place against excessive exploitation by employers.

Adam Smith, in 1776, had predicted the response of 'masters' to attempts by workers to have regulations built into terms of employment,

The masters upon these occasions ... never cease to call aloud for the assistance of the civil magistrate, and the rigorous execution of those laws which have been enacted with so much severity against the combinations of servants, laborers, and journeymen.

(1776, p.85)

Yet, despite strong opposition from free market employers and their supporters, conditions favored workers in their determination to improve their working conditions ⁴⁴².

As employment conditions and wages slowly improved through the last part of the century, more and more of the 'laboring poor' gained a foothold into the ranks of the lower-middle classes. As they did so, they needed to demonstrate their improving social positions in ways required by the established Western European social templates: they would begin to accumulate possessions and expand consumption.

Western social templates result in constant, though relatively slow, expansion in the felt needs of community members. This is so because in order at least to maintain one's social status relative to others, one must ensure that one is at least as affluent as, or, preferably, slightly more affluent than they are.

Of course, to increase significantly one's private possessions and/or publicly stated income is to improve one's social standing beyond that of one's 'social equals'. This usually requires entry into a new group, within which one will need to establish oneself and probably accept a disadvantageous position until accepted by the group.

The costs associated with such a leap in status deter many from attempting to 'climb the ladder'. Comparisons are usually made between others of similar wealth to oneself, attempting to gain as high a position in their estimation as possible without having to move into a new status group.

So, over time, because of this competition within status groups,⁴⁴³ the felt needs of Western people expanded. As the needs expanded, the necessary income to support those needs also expanded. During periods of economic growth in Western countries, people (obtaining higher wages through improved bargaining power) transfer discretionary incomes into necessary income through expansion of felt needs, and so set new baselines for wages.⁴⁴⁴

Inevitably, over time, the perceived needs of Western people became far greater than the perceived needs of people in communities governed by other social templates. In the eyes of most non-Western people, Westerners became, and still are, materially very wealthy. The incomes deemed 'necessary' by Western people have to cover the acquisition of necessities not perceived as such by people in most other communities.

So, even without factoring in the social welfare needs of Western communities, the necessary incomes will be substantially higher than necessary incomes in non-Western communities.

A distinction needs to be made between the necessary income to meet perceived individual needs and the social welfare component costs of production. Wages are not higher in Western countries because they include a social welfare component, they are higher to cover the perceived needs of Western individuals.

Social welfare costs refer to both the costs of the community and the responsibilities of the community toward all its members. Community costs do not only relate to the 'poor box', but also to the general well-being, education and organization of the community and its members.

Over the past two hundred years, Western countries have increasingly emphasized individual rights and responsibilities at the expense of those of the community. In the process, the community becomes weakened until it no longer provides its members with a strong, immediate sense of shared responsibility and identity.

This move toward the individualization of the population and weakening of the responsibilities and cohesion of communities has been accentuated over the past thirty years.

The emergence of welfarism : Social Costs are Production Costs 📅

It took Western communities a long time to come to terms with the need to provide a coherent social welfare program. Such a program needed to include both the funding of general community responsibilities and protection of those in the community who had lost access to subsistence resources and could not find employment.

It was not until the early 1930s that concerted efforts were made by Western governments to establish welfare legislation to underwrite health, education and the livelihoods of the least affluent of their populations. Prior to that, workers relied on welfare capitalism. Piecemeal legislation existed in conjunction with community-based charities to meet the needs of those in the most desperate of economic straits.

In the 18th and 19th centuries, the most common attitude amongst the 'middle classes', to those who had lost access to subsistence resources but had no cash income ⁴⁴⁵, is well expressed in a paper written by R. J. Morrison in 1842. It was entitled,

Proposals to abolish all poor-laws except for the old and infirm: and to establish asylum farms on which to locate the destitute able-bodied poor; who might thereon maintain themselves and benefit the country £18,600,000 annually.

The paper was written in defence of an 1834 amendment to the Poor Laws in which the destitute were to have social welfare supports removed in order to compel them to accept whatever wages and conditions the market might impose.

There was also, of course, a range of papers written by individuals and groups concerned for the welfare of the destitute, arguing for state protection of the poor. Legislative measures to provide for the poor were, however, at best partial and under constant attack from economic enterprises which saw them as imposts threatening the competitive viability of industry. ⁴⁴⁶

It was not until Western nations were plunged into economic depression following the stock market collapses of 1929 that Western governments were forced by popular pressure into building coherent sets of social welfare policies and institutions. From the 1930s to the 1970s, in Western nations, as Stephen Gill explains:

... statist planners and productivist forces pressed successfully for the creation of a national economic capacity (and also autonomy), welfarism, and Keynesianism, with specific policies designed to inhibit the pure mobility of short-term speculative capital. The aim, in the words of the US Secretary of Treasury during the New Deal, was to make finance the 'servant' rather than the 'master' of production. (Gill 1994, p.174)

 (14/05/17)

After the 1929 financial collapse, people in Western nations, who had been experiencing economic boom conditions over the preceding ten years, found out just how vulnerable they were to the vagaries of the international marketplace. Stock markets crashed, businesses collapsed, and millions of people lost their savings and their jobs.

Since most Western wage earners, by the 1930s, no longer had access to subsistence resources, loss of employment meant destitution for millions. In the wake of this economic depression, voters in many Western countries turned to political parties which promised that they would directly address the problems of the Depression period.

In the USA, Franklin D. Roosevelt promised the population a 'New Deal' which would introduce a range of measures to protect people from such disasters in the future⁴⁴⁷. Amongst the measures he introduced were:

★ *The Fair Labor Standards Act* (1938). The Administration, in 1933, attempted to set up an agency to enforce codes of fair practice for business and industry.

The legitimacy of the initial agency was successfully challenged in the courts, but, by 1938 its intentions had been successfully established through the above Act.⁴⁴⁸

The codes included:

- minimum age;
- minimum wages;
- maximum hours;
- the right of workers to join unions;
- and provided means for establishing minimum prices to protect businesses from unscrupulous price cutting.

★ *The Social Security Act* (1935) which aimed to provide workers with a guarantee that, in the event of their encountering reduced circumstances, their basic needs would be met.

Among the programs which were established over time were: unemployment, old age, and disability insurance; public assistance for the needy; and child welfare.

In 1965, Medicare was added to the Social Security system to provide hospital care, nursing homes, and other medical services for those over the age of 65 years.

★ *The National Labor Relations Act* (1935) which overturned much of the employer/employee legislation and practice that had emerged through the 1920s. Amongst other things it,

- guaranteed workers the right to organize and collectively bargain with their employers;
- guaranteed workers the right to strike;
- prohibited unfair labor practices by employers;
- outlawed company unions or employer-controlled unions;
- prohibited discrimination against employees who brought charges against or testified against a company in court;
- and made it unlawful for the employer to refuse to bargain collectively with an authorised employee representative.

 (27/08/17)

To free marketeers, the legislation of the 1930s was a direct attack on 'free enterprise', a 'socialist conspiracy' against the **wealth creators** of the nation.

The campaign against these measures, [which began in the 1930s](#), was to continue through the rest of the century. Its rhetoric was refined through the 1960s and emerged as neoliberal free market philosophies and policies. These set the agenda for the globalization of economic activity from the mid 1970s.

In its inception, however, the New Deal legislation represented the first coordinated governmental attempt in the US to ensure that the social costs of communities were included in production costings⁴⁴⁹. As Paul Boller says,

In its efforts to cope with the Great Depression, the federal government under Roosevelt took measures to help the poor and jobless for the first time in American history.
(1981, p. 259)

Through measures such as these, Western governments accepted direct responsibility for managing their economies in the interests of their constituents.

Effectively, producers were required to include a 'social welfare' component as part of the costs of production. The price of each product included not only the direct costs of labor, material resources, infrastructure and technology, and a 'profit' component; now the price also included the social welfare requirements of workers, their dependents and other members of the community ⁴⁵⁰.

Most of those who were involved in managing economic enterprises saw these new costs as illegitimate imposts on business. It is possible to argue, however, that after more than two hundred years of social trauma resulting from the market-driven need to cut costs (to which social costs seemed most vulnerable), Western nations had matured.

At last, communities were insisting that capitalist enterprises be geared to meeting the needs and wants of the communities within which they existed. This was not an illegitimate demand.

Capitalism and Parasitism

Where enterprises are required to purchase material resources, from the outset it has been accepted that the price of resources includes two separate components. The first component comprises the costs of extraction and processing of the resource. The second component comprises the profit margin of the supplier. Any supplier which, over the long run, sold its product for less than the cost of extraction and processing, would, by definition, fail.

While all enterprises drive to reduce costs, there is a cost of material resources below which, over the long run, prices cannot be maintained. This same logic, however, had not been applied to the supply of labor.

In the early years of European capitalism, labor was supplied from communities which still had access to subsistence resources. Laborers relied, as Marx put it, on 'all the guarantees of existence afforded by the old feudal arrangements'. [Business only had to pay the competitive market rate for labor](#), without a baseline determined by its 'costs of extraction and processing'.

In a real sense, capitalist enterprise, as it evolved in Western Europe, was parasitic upon the feudal communities within which it operated. Capitalist

enterprises saw themselves as separate from the communities in which they did business ⁴⁵¹.

As those communities became reshaped by the new forces of capitalism, they increasingly became dependent upon capitalist forms of production and consumption for subsistence. Communities lost their other means of subsistence based on 'all the guarantees of existence afforded by the old feudal arrangements' and had to rely on market-driven production and employment for all their needs and wants.⁴⁵²

Community needs and wants do not only relate to employed people and their dependants. They include the requirements of all community members, and costs of all the activities and responsibilities of the community. Capitalist activity became the basic means by which communities supplied their needs and wants.

However, since businesses had long calculated their inputs excluding any costs associated with support of the communities within which they operated, they, inevitably, saw any attempts at imposing such costs as illegitimate and parasitic.

Capitalist enterprise in its evolution was parasitic on communities in which both individual subsistence and the community's needs and wants had been supplied by other means. When it undermined and displaced those alternative avenues of need and want provision, the presumption that community welfare requirements were met through other means was, conveniently, retained.

 (27/07/17)

In a peculiar way, which can only be understood as one understands the primary ideologies of Western people ⁴⁵³, economic activity was assumed to be separate from social and political activity. Following Adam Smith's identification of an 'economic environment' it was considered to be subject to its own laws and regulations, with its own independent sets of responsibilities relating to performance within the marketplace.

Communities, it was argued, should take responsibility for the provision of their own needs and wants. They should not become 'parasitic' on business.⁴⁵⁴

Community costs are Production costs

 (17/04/18) (29/05/20) (12/06/21) (23/01/16)(07/07/16)(02/06/17) (18/06/24)

In the 1930s, Western communities finally required economic enterprises to accept social welfare needs as part of production costs.

As long as all businesses within a nation accepted the welfare component as an inescapable cost of production, and could be protected from competition from imported products which did not include such a cost, social welfare could be maintained as a reasonable cost on production ⁴⁵⁵.

After all, the real issue at stake was whether productive activity occurred primarily for the good of the community or whether production could be divorced from social responsibility.

Was 'the economy' separate from, and not responsible to 'the community', or was it the means by which the community met *all* of its material needs and wants?

Jerry Brown summed it up nicely:

...[W]e as human beings in a society have constructed what we call an 'economy' and... this construct should be serving the interests of people as opposed to all people having to adapt to that construction when it becomes obvious that it is not working for many.

One of the things about power is realizing you might actually have the ability to exert some level of power in the first place. If you think you have no power over something- then you don't really have any power over that thing. Realizing that you, or we, might have an ability to not blindly follow the dictates of 'the market' is a type of power in itself. (Jerry Brown, Comment on ^œ[Bill Mitchell, MMT and Power - Part 2](#), June 10, 2021)

Newton Finn, in a comment on a blog entry by Bill Mitchell entitled 'Progressive journalists in Britain so easily become willing mouthpieces for mainstream economic lies', incisively explained why there is so much resistance, in capitalist societies, to the obvious [truths of 'Modern Monetary Theory'](#):

...MMT's obvious truths, especially that the federal government has total control over the creation and distribution of fiat money - point toward socialism, while the fiction of money being largely in private hands, and needing to be clawed back by the government in order to be spent, tends to vindicate capitalism.

(Newton Finn, Comment on ^œ[Progressive journalists in Britain so easily become willing mouthpieces for mainstream economic lies](#), *William Mitchell - Modern Monetary Theory*, June 17, 2024)

It is [the nature of ideologies](#) that those whose lives are shaped by them will be acutely aware of any form of possible attack on the coherence of those ideologies. Inevitably, any 'understandings' which challenge their core presumptions will be dismissed and/or attacked. The New Deal reforms of the 1930s~ inevitably triggered such attack by those whose lives had been shaped and sustained by blind adherence to 'capitalist' understandings of the world.

In the climate of the 1930s and in the post-Second World War era, the answer was very definitely that 'the economy' was the means by which a community met its needs and wants. These included the needs and wants of its least advantaged members. Governments, therefore, managed economies in the interests of their populations.⁴⁵⁶

The New Deal reforms of the 1930s were the first reforms in the United States which clearly established the principle that community costs should be built into the costs of industry .

In a period of booming economic growth following the Second World War, Western countries continued to accept responsibility for the social and economic welfare of their populations. [A range of taxes and charges](#) were instituted to cover the costs of education, health, and social welfare programs. It was considered socially responsible to redistribute incomes toward the poor through such programs.

This resulted in the sliding taxation scales of the period and increases in company tax rates⁴⁵⁷. After all, it was argued, businesses not only benefited directly through better educated, better nourished and more contented employees, they were also, in the final analysis, community

assets, which should contribute to community well-being. Businesses had a 'social' responsibility.⁴⁵⁸

Sebastian Mallaby has described how crises can drive change - though sometimes, as he says, it takes two crises to cement a transformation. His article, entitled 'The Age of Magic Money: Can Endless Spending Prevent Economic Calamity?' addresses, rather hesitantly, a possible solution to the 2020 difficulties in which so many nations around the world find themselves embroiled ⁴⁵⁹.

Not only did the 'Welfare State' emerge through such reforms, in accord with the spirit of the times, [benign welfare capitalism](#) became 'normal practice' for business. Daniel Gross (2004) has explained it well,

Even with the rise of the welfare state in the '30s, corporations continued to assume responsibility for the well-being of their employees. It was part of a grand bargain between labor, capital, and government that allowed for remarkable growth, innovation, and rising standards of living for decades. It also served as a bulwark against socialism. By endowing labor with dignity, welfare capitalists made industrial work a ticket to the middle class.

(^œ[Welfare capitalism is dying. We're going to miss it](#)

For some of the unintended consequences of this shift, see: [The new 'middle class'](#))

The society did not exist to service the economy. Rather, the economy existed to provide a better quality of life for community members.

Protectionism 🇺🇸

 (22/06/21) (11/02/24) (14/02/24)

In this climate, with the economy servicing the community, industries and, therefore, the jobs which they created and the contributions they made to social welfare, could be 'protected' through the imposition of a range of tariffs on competing imports. The inflow of goods could be regulated by a range of permits, licences, quotas and charges ⁴⁶⁰.

This 'interference' with 'free' international trade was strongly justified in terms of [governmental responsibility for insulating its population](#) from the effects of unregulated international competition. Because of the experiences of the 1930s, this included governmental responsibility to safeguard jobs. It was assumed that they would, otherwise, be lost to those countries where production was cheaper because those who controlled production did not accept that economic pricings should include costs related to the maintenance of social welfare.

Effectively, Western governments required the value of goods to include a component for the social welfare - the 'costs of extraction and processing' - of the communities in which they were produced. They, therefore, had to protect producers and manufacturers from unfair competition from counterparts in other countries whose pricings did not include such a component and a range of barriers to trade were instituted ⁴⁶¹.

It was also believed that private banks and similar organizations needed to be strongly regulated. This belief was founded in historical experience and reflected the conviction of the general public following the 1929 crash that,

...measures of a national scope were needed to alleviate the disruptions caused by bank failures.

(^œFDIC 1984, Ch. 1, p. 3)

In the 18th and 19th centuries, as banking expanded to provide facilities to increasing numbers of investors, it was found that unless legislative checks were instituted, banks were at risk of collapse, based, not on their own performance, but on rumour and speculation in the community ⁴⁶².

If people heard that a bank was in trouble they, quite reasonably, hurriedly withdrew their deposits. Since banks make money through lending and investing based on (among other things) the assumed value of income received as deposits, no bank, if required to return all deposits, could continue to operate. Without legislative protection from such runs on their holdings, banks collapsed; they were 'bankrupted'.

The New Deal legislation of Roosevelt in the USA quite explicitly included further reinforcement and refinement of such protections, since it was widely held that a prime cause of the 1930s Depression had been failure in the regulation of major banks.

The Glass-Steagall Act of June 1933 gave government the authority to curb speculation by the banks and established the Federal Deposit Insurance Corporation (FDIC) which guaranteed all deposits up to \$US2500. This was aimed at convincing small investors that their money would be secure in a bank so that they would not withdraw deposits in anticipation of bank failure. The maximum amount has been periodically increased since then to more or less keep pace with inflation. ⁴⁶³

In 1935, Congress transferred a great deal of the authority formerly wielded by regional Federal Reserve Banks to the Federal Reserve Board in Washington. In addition to its basic fiscal responsibilities, it was given power to exercise direct control over interest rates and could therefore 'manage' economic activity in the marketplace by encouraging or discouraging bank lending.

It was not only necessary to stabilise banks and manage them to contribute to community well-being. It was also believed countries were at risk unless legislation was in place to limit the possibility of invested capital being withdrawn from a country whenever it appeared that there was some kind of economic problem which threatened short-term profits. This safeguarded productive enterprises from short-term economic swings over which they had little or no control ⁴⁶⁴.

Paul Einzig, in 1934, in the wake of the first flush of New Deal regulation, spelt out both the desirability and inevitability of capital controls in well regulated capitalist societies:

...[I]t may well be asked whether we can take it for granted that a return to freedom of exchanges is really a question of time. Even if the reply were in the affirmative, it is safe to assume that after a period of freedom the regime of control will be restored as a result of the next economic crisis.

(Paul Einzig, *Exchange Control*, MacMillan and Company, 1934).

Foreign exchange controls remained in place - and, in many Western nations, were strengthened through the post-war years. Governments maintained strong control over the outflow of their own currencies and the inflow of foreign currencies. *Encyclopedia Britannica* explained:

Exchange control, governmental restrictions on private transactions in foreign exchange (foreign money or claims on foreign money). The

chief function of most systems of exchange control is to prevent or redress an adverse balance of payments by limiting foreign-exchange purchases to an amount not in excess of foreign-exchange receipts.

Residents are required to sell foreign exchange coming into their possession to the designated exchange-control authority (usually the central bank or specialized government agency) at rates set by the authority.

(^œ[Exchange control: government restrictions](#), *Encyclopedia Britannica*, accessed June 22, 2021)

Wikipedia provided a brief summary of common controls:

Common foreign exchange controls include:

- banning the use of foreign currency within the country;
- banning locals from possessing foreign currency;
- restricting currency exchange to government-approved exchangers;
- fixed exchange rates
- restricting the amount of currency that may be imported or exported;

(^œ[Foreign exchange controls](#), *Wikipedia*, accessed June 22, 2021)

Investopedia explained their purpose and, in the process, also provided information on the role of the IMF in dismantling those controls in the post 1960s period,

Exchange controls are government-imposed limitations on the purchase and/or sale of currencies. These controls allow countries to better stabilize their economies by limiting in-flows and out-flows of currency, which can create exchange rate volatility.

Not every nation may employ the measures, at least legitimately; the 14th article of the International Monetary Fund's Articles of Agreement allows only countries with so-called transitional economies to employ exchange controls.

(^œ[Exchange Controls](#), *Investopedia*, accessed June 22, 2021)

Christopher Neely, in 1999, addressed the post-1960s arguments in favor of free capital mobility and consequent removal of capital controls in the neoliberal era - primarily justified using [economic efficiency](#) arguments.

As he explained, there was, for a time, muted advocacy for their reintroduction by some who were concerned with the ^œ[impact of 'sudden stops'](#), as described by Krugman in the [above footnote](#), though few genuinely effective controls have been introduced in Western countries (which can also be negatively impacted by 'sudden stops'; as Greece, Spain, Portugal, Ireland and other EU countries have found over the years):

The consensus among economists has been that capital controls - like tariffs on goods - are obviously detrimental to economic efficiency because they prevent productive resources from being used where they are most needed. As a result, capital controls gradually had been phased out in developed countries during the 1970s and 1980s, and by the 1990s there was substantial pressure on less developed countries to remove their restrictions, too (New York Times, 1999). The topic almost had been relegated to a curiosity...

...[A]rguments for free capital mobility are similar to those that are used to support free trade. Countries with different age structures, saving rates, opportunities for investment, or risk profiles can benefit from trade in assets. More recently, economists have emphasized other benefits of capital flows such as the technology transfer that often accompanies foreign investment, or the greater competition in domestic markets that results from permitting foreign firms to invest locally (Eichengreen, et al. 1999). The benefits of capital flows do not come without a price, however. Because capital flows can complicate economic policy or even be a source of instability themselves, governments have used capital controls to limit their effects (Johnston and Tamirisa, 1998)...

...In reality, capital controls rarely have been imposed in a well-thought-out way to correct clearly defined pre-existing distortions. Instead, capital controls most often have been used as a tool to postpone difficult decisions on monetary and fiscal policies. Recently, however, the case has been made that capital controls may be the least disadvantageous solution to the destabilizing effects of capital flows on inadequately regulated financial systems. (Christopher J. Neely, ^œ[An Introduction to Capital Controls](#), *Federal Reserve Bank of St. Louis Review*, November/December 1999, pp. 13-30.)

Similarly, national currencies were protected from international exploitation. Exchange rates were fixed by governments and legislation existed limiting the possibility of trade in currency ⁴⁶⁵.

While many 21st century economists, wedded to internationalized, free-market policies requiring the free flow of 'credit' across national borders, consider any attempt at the reintroduction of exchange controls as 'government interference in the market-place', there does appear to be movement toward reintroducing national sovereign governmental control of such movements. The Chinese move to a 'digital' economy, with all transactions visible to, and so controllable by, the central reserve authority, seems to be a clear move in this direction.

In this 21st Century, as one might expect, there will be fierce opposition to any such reintroduction of public controls by the Western World's financial centers. However, it is the responsibility of sovereign governments to maintain control over their economies, protecting the stability of their internal economies and the economic wellbeing of their populations ⁴⁶⁶.

It is time to reset the economic focus of sovereign states. The [economy must always be servant](#) to the community it serves - and that community must include the entire population of the state - not merely a privileged few! To ensure this, governments must reintroduce exchange controls and that means control of capital flows in and out of the nation.

In the post-WW2 period governments 'managed' their economies ⁴⁶⁷. **The economy was servant to the country rather than the country being servant to an internationalized economy** which could claim to be independent of communities and not responsible for their social welfare.

[No Social Welfare for post-colonial nations](#) ¶

The situation was a little different in the Third World. Many of the welfare programs established in Western nations were not established in post-colonial countries.

Most colonial administrations had assumed that wage laborers in their regions belonged to rural communities which would support them. They were assumed to have access to subsistence alternatives if they lost employment. They therefore saw little need to provide economic safety nets for people who had little or no cash income. Post colonial governments inherited administrations which held these views.

So, few Third World nations developed the kinds of social welfare programs which became standard in most First World countries. Those who lost employment should, as colonial administrations had insisted they must, return to their rural bases and become involved once again in rural communities and subsistence forms of livelihood ⁴⁶⁸.

This presumption of the continued existence of viable subsistence alternatives to wage employment has persisted in the face of mounting evidence of the degradation of rural environments and burgeoning rural poverty. In consequence, those who have no viable subsistence alternatives find themselves destitute and the problem of deepening rural and urban poverty in Third World countries mounts daily.

Because wage rates and taxes and charges on businesses have been calculated to cover the costs of welfare in Western countries, industries have had to factor in such costs. On the other hand, where no such welfare is provided, the costs of industry are much lower.

Third World countries, which originally attracted labor-intensive industry on the basis of much lower labor costs, cannot, therefore, institute welfare programs, since this would raise costs and discourage the entry of labor-intensive industry. So, although the subsistence alternatives in many countries are now more imagined than real, Third World governments and industries continue to exclude social welfare costs from the costs of production.

This, coupled with a smaller range of perceived needs and therefore lower necessary incomes for Third World workers, make labor-intensive industrial goods much cheaper than such goods manufactured in Western countries.

Western countries, during the 1950s and 1960s, were well aware of the possibility of losing labor-intensive industry to low-wage countries. This was one of the reasons for maintaining tariff barriers. They were aimed at supporting local enterprise from low-wage competition ⁴⁶⁹.

This kind of 'protectionism' could only continue, of course, if Western governments concurred and import restrictions were biased against producers whose prices did not take into account both a social welfare component and the heightened needs base of Western workers ⁴⁷⁰.

The triumph of neoliberalism 🇺🇸

(14/07/16) (27/02/17) (17/08/17) (25/07/16) (04/02/17) (15/10/17) (05/01/23) (07/07/24)
(15/07/24)

The 1970s heralded a revolution in Western nations which reverberated through the rest of the world.

It had been forty years since the establishment of welfare legislation to underwrite health, education and the livelihoods of the least affluent of their populations and, through that time, a vocal minority had bewailed the arrival of the 'nanny state', 'a term of British origin that conveys ^œa view that a government or its policies are overprotective or interfering unduly with personal choice'.

The *entrepreneurial* spirit of the enterprising individual had been smothered, 'state dependence' had sapped the 'venturing' spirit of the 'enterprising individual'.

As Christopher Shook *et al* explained in an article entitled '^œVenture Creation and the Enterprising Individual: A Review and Synthesis' (*Journal of Management* Volume 29, Issue 3, June 2003),

Venture creation is at the heart of entrepreneurship. Enterprising individuals or groups start new ventures and, thus, we must understand the role of individuals if we are to understand venture creation.

This was to be the age of 'the entrepreneur', the deliberate emancipation of venturing individuals from the swaddling bands of the 'welfare state'. The Western World would **cast off the 'chains of society'**.

As Jean-Jacques Rousseau (1712-78) had opined in ^œThe Social Contract',

Man is born free; and everywhere he is in chains. One thinks himself the master of others, and still remains a greater slave than they. How did this change come about?...

Human beings are 'born free' but, from birth, society seeks to dominate them, forcing them into unchosen, individuality-sapping straitjackets. Stifling their longing to freely express their own pre-social individuality as 'independent individuals' determining their own futures, forging their own 'success' in a world of liberated, self-promoting, self-interested individuals, free to 'develop themselves' in an entrepreneurial marketplace in which individuals, wherever they might live, 'get what they deserve'!

'Big Government', the inevitable consequence of the 'welfare state', would be dismantled, its accumulated spoils redistributed to enterprising individuals to be 'developed for profit' in that new, heroic world of rugged, self-promoting individuals accumulating 'wealth' which was their sure reward.

Ayn Rand was their prophet, ^œ*Atlas Shrugged* their Bible and Galt's Gulch their goal.

The result, over the next forty years, would be unraveled societies, opened borders, and the unleashing of unregulated exploitation of peoples and environments. A world in which 'the economy', the playground of enterprising pre-social, self-interested and self-promoting individuals, has displaced community and society in a warped travesty of that ^œMartin Luther King' dream:

...Free at last. Free at last. Thank God almighty, we are free at last...

Since success in the marketplace is based on keeping costs as low as possible in order to remain competitive, those involved in economic enterprise have, since the 1930s, strongly resisted and protested the 'imposition' of social welfare costs.

This opposition has been expressed both through 'neo-conservative' politics and through the policies of the 'radical right'. That is, politics based on arguments about the centrality of the marketplace; the separation of economic activity from political and social activity; and the reinstatement of pre-1930s conditions for industry.⁴⁷¹

In a market economy, the costs of raw materials are based on demand and supply and costs of extraction and processing. The social costs of production however, are, in the neoliberal 21st century, claimed to be based only on demand and supply. The costs of the community in which that labor is situated are separated from the costs of labor itself.⁴⁷²

That is, the costs of 'extraction and processing' of the labor are shifted away from the enterprise to the community to the extent that economic enterprises can convince the community that they are separate from it and bear no responsibility for its well-being⁴⁷³.

The fundamental rationale underpinning the post-1960s neoliberal reorganization of Western communities had been well explained in a 1919 [ruling by the Michigan Supreme Court](#):

A business corporation is organized and carried on primarily for the profit of the stockholders. The powers of the directors are to be employed for that end. The discretion of directors is to be exercised in the choice of means to attain that end, and does not extend to a change in the end itself, to the reduction in profits, or to the nondistribution of profits among stockholders in order to devote them to other purposes.

Milton Friedman, in a 1970 *New York Times* article, entitled ["A Friedman Doctrine-the Social Responsibility of Business is to Increase Its Profits"](#) (September 13, 1970, pp. 33, 122), had revived it.⁴⁷⁴

All activity within business enterprises would, in [this emerging neoliberal, 'user pays' world](#), be focused on 'shareholder wealth maximization'⁴⁷⁵.

Even where wages include a component for the upbringing of offspring and for the old age of the worker, these costs are assumed to be related to the personal requirements of the individual worker. As the British Prime Minister Margaret Thatcher proclaimed in the 1980s⁴⁷⁶, there is no society, [only individuals who choose to congregate](#) and should, as individuals, meet the costs of their interaction.

In the minds of those who accept this logic, there are only individuals and the economy⁴⁷⁷. Everything else is a consequence of economic interaction between competing individuals. Those individuals should take responsibility for the provision of their own needs and wants, they should not demand contributions from other competing individuals. That is, 'user pays' principles should apply to social costs.

This has been the argument at the center of neo-conservative political demands for removal of social welfare costs from economic enterprise⁴⁷⁸. As we will see, [in the 1980s and 1990s these arguments were increasingly effective](#) in reducing social welfare costs to industry.

By the late 1960s, individuals and organizations, committed to improving the economic lot of Third World peoples, seemed to have forgotten - or perhaps never clearly understood - the reasons for the protectionist legislation of the period. They argued strongly that Western governments should 'deregulate' economic activity and encourage international economic interaction through lowering tariff barriers and allowing imports from low-wage countries.

The economic woes of the Third World they were attempting to address were, of course, a result of problems that post-colonial nations endured as they struggled to establish viable nation-states ⁴⁷⁹. Not least were the burgeoning debts owed to First World countries which had provided them with both 'development aid' and 'military aid' from the late 1950s onward ⁴⁸⁰.

With the approval of major Western governments, transnational companies increasingly began to locate their low-wage production activities in selected Third World countries. This was facilitated by new transport developments, particularly the development of container shipping which transformed Western waterfronts during the 1970s.

Those who were most directly involved in Third World development planning and programs strongly approved these moves. They saw this new movement to produce low-wage goods in Third World countries as providing a new base for national development in those countries.

With the failure of import substitution industrialization, and the faltering of value-added industrial development ⁴⁸¹, this new move by transnational companies to relocate in Third World countries was seen as a 'window of opportunity' for Third World people. Where government-directed planning had not succeeded, private investment from Western countries would. Development agencies, therefore, strongly promoted various forms of deregulation to facilitate transnational investment in the Third World ⁴⁸².

Let's not myopically fool ourselves about who have, for the past fifty and more years, been responsible for the de-industrialization of Western nations. The drive to deregulation was not driven by the demands of the non-Western nations within which industrial activity was relocated. It was driven by the demands of Western corporations and financiers eager to exploit the weak or non-existent regulatory environments of those nations.

In the third decade of the 21st century, with the inevitable consequences of the neoliberal deregulatory demands of those private entities, 'expert' commentators have myopically seen the [problem not as one of Western Greed](#) but of non-Western governments 'unfairly undermining U.S.-based manufacturing by using exploited labor and providing sweeping state subsidies to locally based firms'.

As Ro Khanna, in a display of historical amnesia (or deliberate propaganda in support of US warmongering), explained:

For many citizens, the American dream has been downsized. In recent decades, the United States has ceased to be the world's workshop and become increasingly reliant on importing goods from abroad. ...

China has played a significant role in this deindustrialization of the United States. The explosion in job losses occurred after the U.S. Congress granted China the status of "permanent normal trade relations" in 2000, ahead of China's accession to the World Trade Organization. Between 1985 and 2000, the U.S. trade deficit with

China had grown steadily from \$6 billion to \$83 billion. But that deficit ballooned more dramatically after China joined the WTO in 2001, and it now stands at a stratospheric \$309 billion. Once in the WTO, China unfairly undermined U.S.-based manufacturing by using exploited labor and providing sweeping state subsidies to Chinese firms. Even more than NAFTA - the 1994 free trade deal that allowed many U.S. manufacturing and farm jobs to move to Mexico - the liberalization of trade with China decimated factory and rural towns, particularly in the Midwest and in the South. This devastation fueled the rise of anti-immigrant xenophobia, anti-Asian hate, and right-wing nationalism that has threatened democracy at home through extremism and violence in U.S. politics.

(Ro Khanna, ^œ[The New Industrial Age: America Should Once Again Become a Manufacturing Superpower](#), *Foreign Affairs*, January/February 2023)

Neoliberalism: A Cure for Economic Stagnation 🇺🇸

 (08/10/18)

After a period of economic boom conditions in Western countries following the 2nd World War, they experienced a decade of economic stagnation. This gave economists and those convinced that the reforms of the 1930s were both economically and morally wrong, a base from which to argue that the changed economic fortunes of the West were a consequence of the 1930s reforms.

The booming economic conditions in Western countries during the 1950s were driven by:

- the need to replace and upgrade infrastructure after the 2nd World War;
- a housing boom as troops returning from war married, had families and required accommodation;
- the need to develop all the education, health and other social infrastructure required by the 'baby boom' which accompanied this;
- the ongoing demands stimulated by the Korean War;
- the rapidly expanding purchasing power of workers living in a boom economic period;
- and all the requirements of the emerging superpower 'cold war'.

During the 1960s and 1970s, those same nations experienced long-run economic problems as the overheated economies of the fifties led to productive over capacity.

The world experienced an oil crisis in the early 1970s, largely driven by the emergence of The Organization of Petroleum Exporting Countries (OPEC) as the first major cartel of oil producing countries. This, coupled with the economic difficulties which emerged during the 1960s, led economists and other interested parties ⁴⁸³ to claim that the economic woes of the West were the result of 'protectionist policies' which should be dismantled.

To combat the evils of protectionism, Western economic activities should be 'globalized'. Trade should be '[freed](#)' from [parochial constraints](#). As the World

Trade Organization statement of purpose would later explain,

The economic case for an open trading system based upon multilaterally agreed rules is simple enough and rests largely on commercial common sense. All countries, including the poorest, have assets - human, industrial, natural, financial - which they can employ to produce goods and services for their domestic markets or to compete overseas.

(^œWTO)

Western nations, with faltering economies, began to take such advice seriously and a number of Western countries lowered tariff barriers to selected Third World countries. The most immediate consequence was the relocation of labor-intensive production to Third World countries and the importation of cheap low-wage products into First World countries by companies already established in Western countries.⁴⁸⁴

Jorge Nef (1995) explained a few of the major consequences of this shift clearly:

... [I]mport dependency ... does not mean that developed countries become dependent on less-developed countries for the satisfaction of their consumption needs. Since most international trade takes place among transnationals, all that import dependency means is First World conglomerates buying from their affiliates or from other transnationals relocated in peripheral territories....

Manufacture evolves into a global maquiladora operating in economies of scale and integrating its finances and distribution by means of major transnational companies and franchises (for an analysis of maquiladoras, see Kopinak 1993, pp.141-162). Abundant, and above all cheap, labor and pro-business biases on the part of host governments are [fundamental conditions for the new type of productive system](#).

The lowering of tariff barriers *did not empower* either governments or people in Third World countries. It merely opened them to exploitation by First World companies. Marjorie Mbilinyi (1994) described African experience during this period,

The peoples of Africa are being steadily impoverished. They are also being dispossessed of their lands. Governments like Tanzania, partly in response to popular demand, had begun to nationalize assets and try to guide the economy in the direction that would meet the basic needs of the people and increase national control and make it more inward oriented. Now we have complete reversal so that it is almost worse than in the colonial period.

(Mbilinyi 1994)

First World companies rapidly became 'transnational' and exploited the newly accessible differential between production costs in Western and non-Western countries to greatly expand profits and market share.

The 'balance of payments crisis' which has been a major cause of concern in Western countries over the past thirty years, has, in large part, been a consequence of the internationalization of production which came with the lowering of tariff barriers and transfer of low-wage industry to Third World countries.

The move to lower tariff barriers and to allow cheap imports from low-wage countries required a reduction in protective legislation in Western countries.

From the late 1970s, Western governments began to make such changes⁴⁸⁵.

Economic experts giving advice in these matters seemed unaware of the social welfare differentials between Western and Third World countries. They seem to have accepted, unreservedly, that such considerations should not be taken into account in moves toward the internationalization of economic activity.⁴⁸⁶

Economic Efficiency and the Virtues of De-Regulation 📄

 (26/01/17) (22/03/17) (09/09/19) (03/01/21)

Economics focuses on 'the economy' as a self-existent, independent environment subject to its own laws and constraints⁴⁸⁷. In the process of producing and distributing goods and services, it generates income for the community through the economic interactions of 'real' and 'artificial' individuals.

Political and social environments are considered to be similarly independent. The requirements of each should, therefore, be met from within their own 'resource bases'⁴⁸⁸. Economic activity should be freed from political and social 'interference'.

There is no presumption of the necessity for a 'social welfare' component to costs. So, the best economy is [one which is 'freed' to pursue economic goals](#), unfettered by social and political constraints aimed at [harnessing economic activity to other ends](#).⁴⁸⁹

Low-wage economies, if they are subject to fewer such constraints, are, by definition, more 'efficient' than high-wage economies if they are based on social and political 'protectionism'⁴⁹⁰. If Western businesses were to compete 'on a level playing field' with businesses from these countries, they needed to be freed from the shackles placed upon them by protectionist legislation and 'excessive' social welfare demands.

The world, as [Arvind Subramanian and Martin Kessler](#) have explained, has inexorably moved toward the 'fragmentation of manufacturing across borders - the famous slicing up of the value-added chain - as individual production stages are located where the costs of production are lowest'. Lionel Fontagné and Ann Harrison have described the [consequences of the subsequent deregulation and rise of 'factory-free' economies](#) in the Western world:

The shift towards a "factory-free" economy has drawn the attention of policy makers in North America and Europe. Some politicians have articulated alarming views, initiating mercantilist or 'beggar-thy-neighbour' cost-competitiveness policies. Yet companies that concentrate research and design innovations at home but no longer have any factories there may be the norm in the future. This paper summarizes the key themes emerging from a conference on de-industrialization.

(Lionel Fontagné and Ann Harrison, ^œ[The Factory-Free Economy: Outsourcing, Servitization and the Future of Industry](#), NBER Working Paper No. 23016, January 2017)

Of course, economic experts have not only ignored the social welfare requirements of communities, they have been equally myopic about the environmental costs of economic activity. As Stephen Shrybman explained of international tariff negotiations through the 1980s:

Nowhere is the failure to integrate the environment and the economy clearer than in the GATT negotiations in which, with only limited exceptions, evaluating the environmental implications of trade proposals is not even on the table. To make matters worse, the negotiations are veiled in secrecy, and virtually no opportunity exists for public comment or debate.

(Shrybman 1990, p. 17)

Just as economists failed to accept that social welfare costs should be incorporated into pricings, so they failed to consider the environmental costs of economic exploitation. In both cases, the costs involved, not being immediate and inescapable imposts on the producer, could be ignored in the interests of competitive pricing.

As in the 18th and 19th centuries, Western countries were again being told that they should accept the 'logic of the marketplace', and accept that an efficient economy would deliver social welfare rewards. And, once they were required to confront the issue, many economists also argued that, as the environmental impacts of industry became economically significant, they, too, would automatically be factored into production costs.

There is, however, as we have seen, no evidence from history that in the absence of legislation requiring social welfare and environmental costs to be built into price structures, improved 'market efficiency' will deliver social welfare returns and ensure the protection of the environment from pillage.⁴⁹¹

No argument is made that costs of extraction and processing should be removed from the pricing of material resources, on the presumption that, in some strange way, they will be returned to extractive industry through improved market conditions - the argument would be patently absurd. Yet, this argument has been made, with no apparent awareness of its absurdity, in relation to the social welfare costs of labor.

As Samuels and Shaffer claimed in 1982, the argument that regulation of businesses increases costs, while deregulation improves economic efficiency and will lead to benefits for both businesses and the communities which are required to support them in the deregulated environment, is based on a false premise:

... rather than creating costs, both regulation and deregulation shift them.

For example, regulation of an upstream polluter will increase the polluter's costs of production. But these are costs which hitherto had been borne by others. In this case, the costs formerly borne by the downstream pollutee will be lowered by regulation ...

Regulation has not created the costs, only reassigned them, and that is precisely what deregulation will do. Regulation and deregulation each consists of lower costs for one party and higher costs for the other.

(Samuels & Shaffer 1982, p. 467)

All that deregulation does is move the incurred costs from the 'economic environment' to other 'social' environments. By doing this, those costs are no longer 'economic' costs and are, therefore, irrelevant to economic enterprise. So it can be argued that "one should not require business to take responsibility for 'community' costs".

At the risk of belaboring the point - regulation is the process of expanding economic responsibilities beyond a narrowly confined 'economic

environment' to include other community responsibilities. Deregulation is the removal of those other responsibilities from economic consideration. The question posed in considering regulation and deregulation is:

Does the economy exist independently of the community or is it the means by which the community ensures the supply of all its material needs and wants?

Economic Activity as Non-Social Activity

It is the nature of 'market competition' that prices will be driven to the margins of profitability.

*If no social welfare component is built into industrial costs then prices fall below levels at which social welfare can be sustained.*⁴⁹²

In the absence of alternative means of ensuring social welfare, allowing social welfare costs to be excluded from calculation of the costs of production leads, inevitably, to the impoverishment of those who cannot obtain employment or who are not employable. It also leads to a [necessary scaling down of 'non-economic' community activity and organization](#).

In a most peculiar way, 'economic activity' becomes a form of 'non-social' activity which only contributes to social welfare through the personal incomes generated by economic activity - which, themselves, will not include a social welfare component so long as competition for jobs keeps wage rates low.⁴⁹³ 'The economy' becomes an environment which is separate from, and not responsible to, the community which sustains it.

A number of theoretical models emerged during the 1970s purportedly demonstrating the inadvisability of allowing 'political interference' in economic activity. Government regulations constraining economic activity are assumed to be detrimental to both the economy and to the community which depends on a healthy economy for well-being.

Since a prime assumption of economic theory is that all individuals act out of self interest, including those in government, the activities of government will, by definition, advantage special interest groups. The imposition of government imposts on economic activity is, therefore, not in the interests of the community but of privileged interest groups⁴⁹⁴.

If, however, government backs out of economic regulation, competition in the marketplace will lower prices, improve products and allow for the accumulation of profits. This will encourage investment which, in turn, will result in job creation, which will flow back to the community as increased community well-being. As Peter Kahn has described:

Support for the wave of deregulation that began in the 1970s came from liberal as well as conservative economists. But deregulation was pursued with single minded vigour during the 1980s at least in part for ideological reasons. It embodied a political theory which justified the administration's distaste for activist government.

That theory, called 'public choice', was espoused by a group of market-oriented economists and lawyers who claimed to demonstrate two things:

- first, that an activist government is all but incapable of reaching efficient public-spirited decisions, and
- second, that private markets do so routinely and automatically.

According to public choice theory, regulatory policy results from a badly flawed political marketplace, which makes decisions based not on economic efficiency, but on the power of interest groups to use government to pursue private benefit at the expense of general welfare ...

Public choice theory played an important role in the economic policy of Presidents Reagan and Bush. The proposed balanced budget amendment, and other schemes to limit government or place it on automatic pilot, grow out of this body of theory.

(Kahn 1991, p. 44)

'Public choice' theory, similarly, played an important part in the economic policies of Presidents Clinton⁴⁹⁵ and (in practice, through Senate activity) Obama.

As economic activity became internationalized and the demands of governments increasingly came to be seen as obstructing and distorting economic efficiency, economic justifications for freeing economic endeavor from political constraint became elaborated. Now, all the problems from the 1960s onward could be attributed to 'government interference' in the marketplace. The 'gains' made through the liberalization of international trade seemed to be obvious.

Globalization Lowers Prices, Frees Investment: We're all Better Off!! 🐼

 (20/06/16) (28/06/18) (15/08/18) (11/12/16)(13/08/18)(04/09/18) (06/07/18)(08/07/18)(22/09/18)
(08/08/19)(09/08/19) (10/08/18)(05/09/18) (21/09/18) (23/07/19) (12/07/20) (16/10/20) (20/01/21)
(09/05/21a) (23/03/22)

By the late 1970s, people in Western countries were beginning to benefit from the lower-priced imported goods produced in low-wage countries as major retailers began to obtain the bulk of their merchandise from such sources. As the majority of people in Western countries felt the effects of this flow-through of lowered costs in the form of cheaper goods, they willingly bought these in place of higher-priced locally manufactured alternatives.

Within a short period the effect of lowering tariff barriers became noticeable. Unemployment began to rise in First World countries, with those who worked in labor-intensive industries being the first to feel the effects of low-wage competition. This resulted in increasing unemployment among low-skilled workers. Skidelsky⁴⁹⁶ described the result:

Factories float between countries to take advantage of lower costs. A legal and policy infrastructure has been built to support offshore production that is then imported to the capital-exporting country. Palley rightly sees offshoring as a deliberate policy of multinational corporations to weaken domestic labor and boost profits.

The effect was rapidly disguised, in Western nations, by altering the definition of employment to include all people who 'did any work at all for pay or profit'. This redefinition of employment for statistical purposes has been perpetuated since that time ⁴⁹⁷. The U. S. Bureau of Labor Statistics gives the current definition of employment,

...people are considered employed if they did any work at all for pay or profit during the survey week. This includes all part-time and temporary work, as well as regular full-time, year-round employment.
(^œUSBLS 2010)

Even one hour of paid work in a week now qualifies an individual for definition as 'employed'. The definition has been completely divorced from any consideration of a 'living income'. The relation between 'employment statistics' and living standards was broken, allowing for the disguised growth of a low paid, marginalized workforce in Western countries.

This unequal competition forced First World manufacturing enterprises to consider a number of strategies to 'level the playing field'. They could:

- relocate their manufacturing activities in overseas low-wage areas, thus avoiding the increased 'needs' related wage and welfare component costs of employment in First World countries.;
- focus on improving efficiency through altering production techniques and technologies. This displaced employees with cost-saving machinery, taking advantage of the new technological innovations which have accompanied the continuing computerisation of the First World. This, in turn, incidentally, avoided many of the social welfare costs which have been, in one way or another, levied in association with employment;
- argue strongly for lowering wage rates and the removal of welfare oriented taxes and levies so that they could remain competitive within their present country; or,
- [move out of labor-intensive industry, investing in the newly emerging and rapidly expanding international bond, stock/share and money markets](#) (see ^œ[Capitalism: Sovereign Debt, Quantitative Easing \(QE\) and the Vortex Economy](#) for more on this).

Whether businesses invested in low-wage countries or in the rapidly expanding financial markets, they found the transfer of funds across national boundaries impeded by the range of regulations imposed on financial transactions in previous decades.

Businesses joined with importers and financial institutions in demanding removal of the fiscal and financial regulations imposed by Western governments to control both investment and the money supply. In the process, national controls on economic activity have been continually reduced, freeing an internationalising economy from the demands of the communities which supply the labor and other resources for their activities.⁴⁹⁸

Over the past thirty years all the above strategies have been utilised by businesses seeking an advantage in the marketplace.

From the late 1970s, Western governments, at the instigation of 'economic experts', strongly encouraged the internationalization of home-grown businesses, providing tax and other incentives to such expansion. Successful companies were 'transnational'.

Most companies initially moved their labor-intensive operations 'off-shore', to take advantage of labor costs in countries where perceived needs were lower and no social welfare component was built into industrial costs. In the process they argued for further [lowering of tariff and quota barriers](#) to facilitate this 'internationalization' of economic activity.

Paul Roberts has summed up the 21st century consequences well⁴⁹⁹:

When are America's global corporations and Wall Street going to sit down with President Trump and explain to him that his trade war is not with China but with them? The biggest chunk of America's trade deficit with China is the offshored production of America's global corporations. When the corporations bring the products that they produce in China to the US consumer market, the products are classified as imports from China.

Six years ago ... I concluded on the evidence that half of US imports from China consist of the offshored production of US corporations. Offshoring is a substantial benefit to US corporations because of much lower labor and compliance costs. Profits, executive bonuses, and shareholders' capital gains receive a large boost from offshoring. The costs of these benefits for a few fall on the many - the former American employees who formerly had a middle class income and expectations for their children...

Many of the Western-based firms which did not move to low-wage regions, altered their focuses and forms of organization, reducing their reliance on wage labor through automating production. Others, that continued to rely on unskilled labor, gained a clear advantage through increased competition for jobs in Western countries as the numbers of unemployed grew ⁵⁰⁰.

Businesses, in the face of union opposition, argued that if automation was not allowed they could not remain viable in the new climate of international economic competition. Given the burgeoning unemployment and obvious 'globalization' of economic competition, neither governments nor labor unions were able to counter such demands and by the mid-1980s the move to automation was commonplace. The major costs of production now centered in technology rather than labor.

What started out as a move to automation by labor-intensive industries to counter international competition, became a general move by industry to take advantage of the new forms of automation made possible by developments in computer technologies.

Kukowski and Boulton (1995) described the Sony Corporation's moves to automation:

Sony management described the following as an example of the benefits gained from the company's factory automation activities: It took three to four months to start up Sony's original production lines in Japan, but it required only two to three weeks to bring replicated lines up to speed in Singapore and France. Changing models required only 9.1 % of additional capital investment in Sony's first changeover, 3.5% in the second changeover, and only 1.5% in the third changeover.

In addition, the move to automation resulted in improved quality. The best defect rate using manual labor was 2000 parts per million (PPM), compared to 20 PPM after the first week of automation.

Sony's personnel policy was to remove employees from manual labor jobs through automation so that 'they could become more creative in solving problems and improving operations'. Due to Sony's strong knowledge base in automation and its focus on design for manufacturability, between 1987 and 1990 it increased sales by 121 % with an increase of only 35 employees.

(^œKukowski & Boulton 1995, ch. 5 s. 3)

The Sony policy of removing 'employees from manual labor jobs through automation so that "they could become more creative in solving problems and improving operations"' was, of course, disingenuous. Typically, the problem-solving skills required in the new plants required a level of expertise beyond that held by manual laborers. The numbers of such people in a fully automated plant, as Kukowski and Boulton showed, was far smaller than required in a non-automated factory.

Not only did low-skilled workers find their jobs under threat by these moves, increasing numbers of skilled workers found that their positions had disappeared as automated processes displaced them⁵⁰¹. As the authors say, a 121 per cent increase in sales by the company was accompanied by the employment of a further thirty-five workers⁵⁰².

Just-In-Time and Total-Quality-Control: Let's be *flexible* ! 🐼

 (14/09/19) (18/10/19)

The new catch-cry of industry, taken up and echoed by First World government, educational, health and other institutions became 'flexibility'. As a Report to the Alberta Government on new economic practices in the 1990s explained:

Human resource consultants Olmsted and Smith said that:

With much of foreign competitors' success credited to cheap labor and with technological advances that permit work to be performed by fewer but more sophisticated employees, American companies are focusing on assessing and redirecting labor costs in order to become more profitable
[1989, p. vii].

In 1993 the U. S. Labor Secretary Robert Reich said:

Firing workers to cut costs has gone so far that even reasonably healthy companies are cutting jobs. The cost of these butcher strategies is borne by all, not only in lost output but in higher taxes.

... With the worst of the layoffs behind them, companies are searching for ways to become 'lean and mean' but effective, and 'flexibility' is today's buzzword.

Flexibility is increasingly viewed as providing ways to manage time, space and people more effectively within the upswings and downturns of a global economy. It is also seen as a way to attract and retain good employees in a labor market that is steadily becoming more competitive.

Two different strategies have begun to emerge about how to create a more flexible workplace. The first strategy would create flexibility by using a 'core' workforce and a 'contingent' workforce to manage the workload. The second is to allow flexible working hours and various forms of reduced working hours to meet demand.
(Alberta Labor 1994, p. 3)

As Mittleman (1994) claimed, Fordist industrial organization was now most usually employed in the remaining labor-intensive industries. Those which had moved to new technologies usually also moved to new forms of organization.

These often included the networking of small, closely interlinked companies or company divisions, usually controlled by a 'parent' company, each of

which took responsibility for production of a particular product component; accepted responsibility for 'managing' their workforces; and could be manipulated to minimize costs when their product component was in lower demand (insulating the parent company from such activity).

 (10/04/16)

The new organization of production, often called Just-In-Time (JIT) production processes, coupled with Total-Quality-Control (TQC) systems of surveillance, emphasized direct worker responsibility for the quality of output, coupled with direct accountability to authorities for performance.

The term 'just in time' refers to the relationship anticipated between supply and demand. This form of organization aims to reduce the inventories of manufacturers to a minimum, relying on efficient production techniques to produce item components as they are required. It also has quality control built into the process of production, rather than relying on post-production testing⁵⁰³.

JIT processes require a direct link between the supplier and the marketplace. This form of organization allows for rapid responses to increases, decreases and changes in demand. It therefore assumes rapid filling of orders, rapid scaling down of production as markets become saturated, and rapid retooling and reorganization as products are altered or displaced to meet new demand.

As in Sony's case, factories, workplaces and assemblies of employees/contractors can be built quickly to meet particular demand, and dismantled and moved just as quickly. And the facility is built at the source of demand. [Thomas Palley described all this](#) as 'barge economics':

The new model can be labeled "barge economics" (Palley, 2007b) because it is as if factories are placed on barges that float between countries to take advantage of lowest costs - which can be due to under-valued exchange rates, low taxes, subsidies, absence of regulation, or abundant cheap exploitable labor.

Trade remains central because goods must cross borders and hence the need for trade agreements. However, barge economics is fundamentally different from comparative advantage trade theory. Free trade is about cross-border exchange of goods and services but production is immobile. Globalization is about creating flexible international production networks configured on the principle of global cost arbitrage. This difference is reflected in the policy debate.

The original trade debate was about taking down tariff barriers. Now, the debate is about property rights and investor protection. Unfortunately, this simple but essential insight regarding the difference between trade and globalization is obscured because orthodox economics asserts globalization is merely an extension of comparative advantage theory which motivated the free trade era.

(Thomas Palley, ^œ[The theory of global imbalances](#), 2014, p.15)

This, in the 1990s, resulted in a shift of investment in industry away from low-wage countries and back into major markets.

It emphasized the development of a skilled, versatile, mobile and yet expendable labor force⁵⁰⁴ which could rapidly respond to changes in market preferences, rather than a workforce which supplied low-skilled, cheap labor inputs⁵⁰⁵. It requires flexible employment arrangements, the use of short-term contracts rather than long-term commitment to maintenance of a

stable body of employees, and 'internationally competitive' wages and conditions.

Maria Carmona has described the 2019 consequences:

In 2019, you no longer have to hang from scaffolding to risk your life on the job. Precariousness, stress, and overwork can also make you sick, and even kill you, at a much higher rate than accidents....

We work in safer environments than we did 30 years ago but the physical and emotional health of workers remains fragile. Traditional risks persist - the European Union, for example, has seen a recent uptick in fatal accidents in the construction sector - while at the same time, emerging risks, psychosocial risks, and risks associated with the digital economy are increasing. These include stress, fatigue, and harassment related to the organization of work, working hours, demands, and uncertainty.

"Psychosocial risks are the great pandemic of this century and they are related to the precarious conditions of the labour market," warns Ana García de la Torre, secretary of occupational health of Spain's General Union of Workers (UGT).

The union's latest prevention campaign focuses precisely on "invisible" threats such as overloading and hyperconnectivity. "They are not new, we've been suffering from them for a while, but they have definitely gotten worse."

Today's greatest workplace risk isn't falling or infectious agents, which are more or less under control, but increasing pressure, precarious contracts, and working hours incompatible with life, which, bit by bit, continue to feed the invisible accident rate that does not appear in the news.

In today's frenetic and competitive market, stress has become almost as common at the office as the coffee machine. It is the second most common workplace health problem and is responsible for half of all absences.

(Maria Jose Carmona, [Stress, Overwork, and Insecurity are Driving the Invisible Workplace Accident Rate](#): The pressure to work faster and longer is making work more dangerous for diverse jobs, from delivery drivers to home care workers. *Inequality*, Research & Commentary, September 13, 2019)

In introducing these changes, businesses capitalised on the high ([but disguised](#)) unemployment levels in developed countries to institute new styles of relationship between managers and employees, based on employee uncertainty and 'management by stress' (Sewell & Wilkinson 1992, p. 279).

In a very real sense, businesses, in the 1990s, [renounced responsibility for the social welfare of their employees](#) along with renouncing responsibility for meeting the social welfare requirements of the communities within which they operated. Their responsibilities related to ensuring 'economic efficiency', not to contribution to the quality of life of those they employed.

Many businesses, since the 1990s, have become international organizations, geared to exploiting temporary markets wherever they arise and geared, equally, to the economically efficient use of all inputs, including labor ⁵⁰⁶.

In the 21st century the new employment arrangements have become common-place. This has led to a euphemisation of the term 'temporary workers'. They are now 'the contingent workforce', an established, central focus in 'human resource management' ⁵⁰⁷.

The move to temporary employment was also a move toward increasing stress amongst employees. Since any downturn in company performance resulted in the layoff of temporary staff, those who were in this category - or those who felt that they were next in line to be reduced to temporary status - felt a constant sense of insecurity. They were driven to perform by the fear that if they were seen as less than totally committed to improved performance they would be the first to go.

Do not go gently into that dark night! 🌑

 (20/01/16) (12/07/19)

Not only have the new management techniques introduced increased 'economic efficiency', coupled with decreased contribution to social welfare costs of the communities in which they operate, they have also introduced endemic stress to those communities. Increasing numbers of people live in constant fear of losing their jobs, and therefore their incomes ⁵⁰⁸. More and more people live with a gnawing sense of threat which they cannot escape.

In the new climate which dissociates businesses from 'social responsibility', this increase in stress is seen as positively contributing to 'economic efficiency'. Of course, even in this area, such increases in stress are of short-term value. In the long term, they result in decreased not increased performance from employees ⁵⁰⁹. However, economic experts have not shown versatility in thinking through such consequences of their logically-constructed models.

These techniques veil a number of consequences for employees and for the businesses which employ them. First, although employees are grouped into teams, in the interests of quality control, team members are required to monitor the performance of colleagues. Since the teams are small, if the quality of production is poor, all members are under threat. There is no security of tenure ⁵¹⁰.

Adam Smith, in 1776, provided clear warning of the dangers involved in assuming that 'Merchants and master manufacturers', in pursuing their own interest, have the wellbeing of the community in mind ⁵¹¹:

To widen the market and to narrow the competition, is always the interest of the dealers. To widen the market may frequently be agreeable enough to the interest of the public; but to narrow the competition must always be against it, and can serve only to enable the dealers, by raising their profits above what they naturally would be, to levy, for their own benefit, an absurd tax upon the rest of their fellow-citizens.

In this far more flexible era of production, what firms needed was rapid access to markets and a close relationship between design and production processes. That is, with social welfare costs being reduced through minimizing employment and a widening gap between labor productivity and hourly worker compensation ⁵¹², firms could relocate production closer to markets.

Many companies relocated in Western countries or in maquiladoras on the borders of major markets. In consonance with this return to high-wage

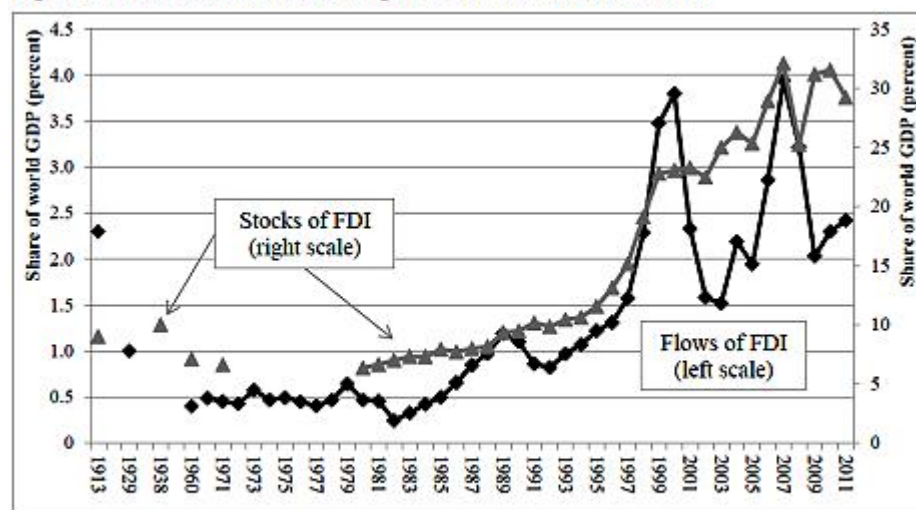

areas, there were concerted political campaigns aimed at lowering or removing the residual social welfare components of industrial costs in Western countries. There was an equally **determined push to lower the real hourly compensation rate** for employees in relation to productivity.

 (28/04/19) (13/05/19)

As borders have become increasingly permeable through processes of deregulation, and transport networks have become increasingly efficient, international control of production and marketing has become more sophisticated. An international fragmentation of corporate organization has occurred, with apparently independent, but tightly integrated, 'multinationals' controlling component manufacture, product assembly and marketing.⁵¹³

Corporations have been able to decouple product design and the organization of production from component and product manufacture and product marketing, resulting in what can best be termed pseudo-foreign direct investment in low cost regions around the world. As **Subramanian and Kessler (2013)** have explained:

Figure 2.2 Stocks and Flows of Foreign Direct Investment, 1913–2011

Sources: Authors, based on data from Bairoch 1996 for 1913–70, Dunning 1983 for stocks and UNCTAD various years for flows for 1970–2011.

A related feature of this era of hyperglobalization is the rise of multinational corporations and the sharp surge in flows of foreign direct investment (FDI), which have both caused and been caused by cross-border and other flows of goods and services. Since the early 1990s (broadly coinciding with the era of hyperglobalization), FDI flows have surged, growing substantially faster than GDP (figure 2.2). Global FDI as a share of world GDP, which hovered around 0.5 percent, increased sevenfold, peaking at close to 4 percent just before the onset of the recent global financial crisis. Even discounting the two surges of 1997–2000 and 2005–08, the general trend is steadily increasing. Global FDI stocks (which are less volatile than flows) jumped from less than 10 percent of GDP in the early 1990s to 30 percent in 2011. FDI flows, and stocks, now surpass levels achieved in the first golden era of globalization, before World War I. By 2009, there were more than 80,000 multinationals, accounting for about two-thirds of world trade (UNCTAD 2010).⁵¹⁴

 (11/01/16)

National borders and 'parochial' legislatures are now seen as impediments which can and should be overcome to ensure genuinely deregulated,

internationalized free markets⁵¹⁵. The consequence of this mindset has, in the 2nd decade of the 21st century, resulted in a range of, often secretly negotiated, sovereignty-threatening, 'free trade' agreements aimed, not only at ensuring further deregulation of trade but, more importantly, at minimizing the effectiveness of 'parochial' legislation in regulating and controlling internationalized corporate organization and activity.

With globalized capitalism intent on accumulating 'credit' as an end in itself (Keynes (1930) "love of money as a possession") the world has, in the past fifty and more years, witnessed the growth of a wide range of tax avoidance games played by multinationals. Tanya Rawal-Jindia has summarized it well:

...Tax havens are a geo-political nightmare and transfer pricing and mispricing are accounting tricks to get money into tax havens. The former is legal while the latter is illegal - but the boundary between them is virtually non-existent.

Transfer mispricing, defined

There's a wide range of tax avoidance games played by multinationals: transfer mispricing, abusive transfer pricing, trade misinvoicing, Base Erosion and Profit Shifting (BEPS), and re-invoicing. All of these fall under the umbrella of trade mispricing, or the intentional falsification of transactions on an international level. Arguably, the polynymity of this deceptive practice is evidence of its ubiquity. But 'thievery' could just as well replace any of these titles.

The short-term goals of misinvoicing vary. In some cases the desired outcome is to dodge capital controls (a strategy commonly used in emerging markets to reduce rapid cash outflows). In other cases, the incentive for misinvoicing is to claim tax incentives or avoid paying duty. Generally, the scheme is this: shift profits out of high tax countries and into low tax countries, or tax havens, while ensuring that the majority of expenses are assigned to high tax countries. (Tanya Rawal-Jindia, ^œTransfer (mis)pricing, the jewel in every multinational enterprise's crown, *openEconomy*, 10 July, 2019)

In the 21st century, [hyperglobalization](#) is becoming the new face of *laissez-faire* capitalism. Tsuyoshi Kawase, in an assessment of the Trans-Pacific Partnership (TPP) agreement, spelt out one of the major consequences of such agreements:

At the conclusion of the TPP agreement, leading figures including Akira Amari, Japan's state minister in charge of the TPP, repeatedly called it a "21st century agreement". By this definition, the TPP is an agreement that facilitates trade in parts and intermediate goods as well as the accompanying international movement of services, data, people, and know-how. It goes beyond trade in finished products predicated on the division of labour and based on the theory of comparative advantage. Trade in parts and intermediate goods has been growing with the advancement of information and communications technologies (ICTs) prompting more companies to unbundle their production processes and leading to the development of international supply chains. Richard Baldwin calls this chain of factors the "trade-investment-services-intellectual property nexus" (Baldwin 2012) and an agreement designed to facilitate the formation of such nexuses is what is meant by a 21st century agreement.

(Tsuyoshi Kawase, ^œThe TPP as a set of international economic rules, *VOX: CEPR's Policy Portal*, 10 January 2016)

 (20/07/17)

Dean Baker, in an essay entitled '[The Battle Over the Trans-Pacific Partnership and "Fast Track" Gets Hot](#)' (*Truthout*, 27 April 2015), provided an insight into the nature of such trade deals:

... [T]he TPP is not primarily about reducing trade barriers. The TPP is essentially a pact in which the Obama administration invited industry representatives to get together a wish list and see what they could impose on the other parties to the deal.

Since formal trade barriers are already low, very little time was spent on cutting tariffs or ending quotas. Most of the deal is about imposing a business-friendly regulatory structure. The rules in the TPP can be used to challenge any consumer, labor or environmental regulation approved at the state, local or federal level. The enforcement powers will rest with an extra-judicial dispute settlement mechanism that will impose penalties that are not subject to appeal.

President Obama of the US summed up the problem while selling the virtues of the Trans-Pacific Partnership:

... What we're negotiating will be by far the most progressive, high-standard trade agreement in history. Labor agreements are enforceable. Environmental agreements are enforceable. If and when this agreement is completed, you're going to have countries who have very low, if any, environmental standards in the past suddenly having obligations to deal with issues like deforestation or dealing with overfishing their waters or pollution or child labor. Those are all going to be suddenly enforceable provisions.

... [W]hen you look at some of the provisions that we're negotiating in TPP, we are raising the standards in many countries, in places like Malaysia or Vietnam, in ways that directly help workers there, directly help the environment, directly go after some of the trends that are causing climate change. And if you're a progressive, you want higher standards, enforceable standards, in those regions.

(WSJ Interview Transcript: President Obama on TPP, China, Japan, Pope Francis, Cuba, *Wall Street Journal*, Washington Wire, Apr 27, 2015)

 (24/01/16)

Responsibilities of sovereign governments, charged with protecting the rights of their populations, [are being 'internationalized'](#). In a brave new [laissez faire](#) world, responsibility for legislation passes from governments to "interested parties" in international "trade agreements".

With such agreements, the guiding maxim becomes [Henry Thoreau's \(1849\) conclusion](#):

"That government is best which governs least"; and I should like to see it acted up to more rapidly and systematically. Carried out, it finally amounts to this, which also I believe, - "That government is best which governs not at all"; and when men are prepared for it, that will be the kind of government which they will have. Government is at best but an expedient; but most governments are usually, and all governments are sometimes, inexpedient.

([Thoreau 1849](#))

Now, international agreements, negotiated in secret between 'interested parties', carry the responsibilities of regulation, handed "extra-judicial

dispute settlement mechanism[s] that will impose penalties that are not subject to appeal" by sovereign governments or their peoples⁵¹⁶.

As Jonathan Weisman explained:

The Trans-Pacific Partnership - a cornerstone of Mr. Obama's remaining economic agenda - would grant broad powers to multinational companies operating in North America, South America and Asia. Under the accord, still under negotiation but nearing completion, companies and investors would be empowered to challenge regulations, rules, government actions and court rulings - federal, state or local - before tribunals organized under the World Bank or the United Nations.

Backers of the emerging trade accord, which is supported by a wide variety of business groups and favored by most Republicans, say that it is in line with previous agreements that contain similar provisions. But critics, including many Democrats in Congress, argue that the planned deal widens the opening for multinationals to sue in the United States and elsewhere, giving greater priority to protecting corporate interests than promoting free trade and competition that benefits consumers. (Jonathan Weisman, 'œ[Trans-Pacific Partnership Seen as Door for Foreign Suits Against U.S.](#) ', *New York Times*, March 25, 2015)

 (03/02/16)

With the negotiations finalized, the Labor Advisory Committee, established as part of "[The Obama administration's corporate-heavy network of official trade advisers](#) ", issued its required report to the US Congress "reflecting the opinions of the Labor Advisory Committee (LAC) on the Trans-Pacific Partnership (TPP)". The first two paragraphs of its Executive Summary read:

On behalf of the millions of working people we represent, we believe that the TPP is unbalanced in its provisions, skewing benefits to economic elites while leaving workers to bear the brunt of the TPP's downside. The TPP is likely to harm the U.S. economy, cost jobs, and lower wages.

The primary measure of the success of our trade policies should be increasing jobs, rising wages, and broadly shared prosperity, not higher corporate profits and increased offshoring of America's jobs and productive capacity. Trade rules that enhance the already formidable economic and political power of global corporations - including investor-to-state dispute settlement, excessive monopoly rights for pharmaceutical products, and deregulatory financial services and sanitary and phyto-sanitary rules - will continue to undermine worker bargaining power, here and abroad, as well as weaken democratic processes and regulatory capacity across all 12 TPP countries.

(R. Thomas Buffenbarger, Chair, Labor Advisory Committee (LAC), 'œ[Report on the Impacts of the Trans-Pacific Partnership](#), December 2, 2015)⁵¹⁷

The first big move made by President Trump upon taking office in January 2017 was to withdraw from the Trans Pacific Partnership (TPP) though it continued in truncated form among most of the other signatories.

However, the US withdrawal from the TPP (and attempted renegotiation of other trade agreements) has not emasculated investor-state dispute lawsuits allowed in existing 'trade' agreements. Manuel Perez-Rocha and Jen Moore have described the 2019 scene, detailed in an *Institute for Policy Studies* report entitled 'œ[Extraction Casino: Mining Companies Gambling](#)

with Latin American Lives and Sovereignty Through International Arbitration:

...In January 2019, for example, U.S.-based Legacy Vulcan LLC registered a case against Mexico over an environmental dispute concerning limestone quarrying near the well-known vacation destination Playa de Carmen. The company cited ecological land use regulations in the municipality of Solidaridad preventing the company from expanding mining operations on two properties. Using NAFTA investment rules, the company is reportedly planning to demand approximately \$500 million in compensation.

The same month, U.S. firm Odyssey Marine Exploration filed its notice of intent to sue Mexico for the outrageous sum of \$3.54 billion for having failed to obtain permits needed to advance an offshore phosphate mine project off the coast of Baja California Sur. This is the largest amount that Mexico has ever been threatened with in any ISDS suit.

These are just two of 38 mining-related investor-state cases documented in a new report by the Institute for Policy Studies, MiningWatch Canada, and the Center for International Environmental Law....

(Manuel Perez-Rocha and Jen Moore, ^œ[Mining Companies Use Excessive Legal Powers to Gamble with Latin American Lives](#): In more than two-thirds of the mining-related lawsuits against governments in the region, communities have been actively organizing against the mining activities, Research & Commentary, *Inequality*, May 10, 2019)

 (17/04/16)

We are entering the [twilight of the democratic nation-state](#)⁵¹⁸.

Do not go gently into that dark night...
Rage, rage against the dying of the light.

[And then We Deregulated Finances and Currencies!](#) 🇺🇸

Concurrently with the move to JIT and TQC processes, all over the world there were insistent demands for fiscal and financial deregulation. It was claimed that this would both facilitate the 'internationalization' of productive enterprises, taking advantage of 'cost anomalies' in different parts of the world; and enable a 'healthy' speculation in currencies and stocks and bonds⁵¹⁹.

As the attack on investment and fiscal regulations became increasingly effective in the late 1970s and early 1980s, people began investing money in the rapidly expanding international currency, bond and stock markets. These provided more lucrative options for investors than developing alternative forms of productive enterprise. As Susan Strange described:

Changes in the global financial structure in recent decades can be considered under five main headings:

- (1) the system has *grown* enormously in size, in the number and value of transactions conducted in it, in the number and economic importance of the markets and the market operators;
- (2) the *technology* of finance has changed as fast as the technology in any manufacturing or productive sector in the world economy;

(3) the global system has *penetrated* national systems more deeply and effectively than ever before - though some people are apt to retort that there is nothing new in international banking or international debt, the degree to which both have played a growing part in national economies and societies is quite new;

(4) The provision and marketing of credit have become overall a much less regulated and much *more competitive* business than it used to be when national systems were less integrated in the global system; and, not least,

(5) the *relation of demand for and supply of credit* has changed rather radically, with very large implications for the world political economy and for the material prospects of many social groups and social institutions in the future.

(Strange 1994, p. 232)

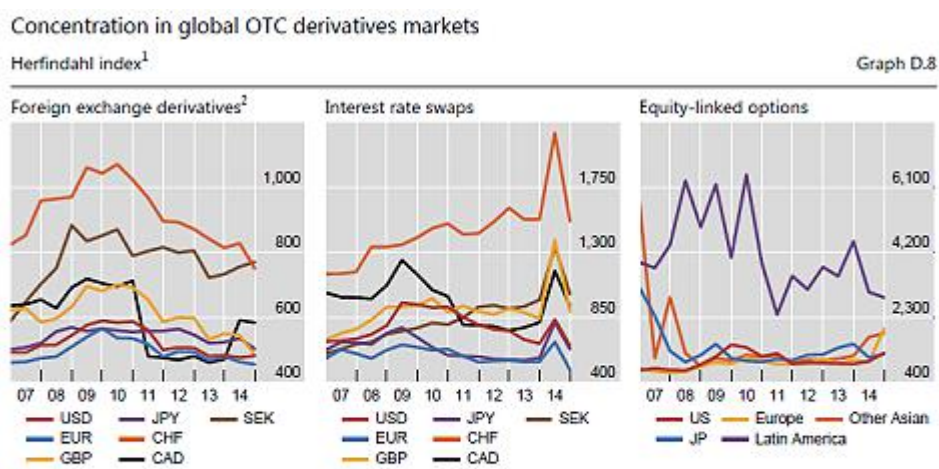

Although it is difficult to quantify the growth in international financial speculation, there is no doubt that it has eclipsed investment in productive enterprise over the past three decades.

Trillions of dollars are shifted daily to take advantage of fluctuating currency values and changes in the value of stocks and bonds based on short-term predictions related to movements in interest rates, government decisions, perceived threat to profits, and short-term profit-taking. Ralph Nader summarized changes over the past twenty years:

... financial market activity has skyrocketed in the past few decades: The value of transactions is now 70 times greater than the size of the real global economy. Trading volume has grown exponentially, skyrocketing from 188 billion shares of stock traded on the Nasdaq and the New York Stock Exchange in 1995 to nearly 1 trillion in 2011. Each year, the notional value of over-the-counter derivatives traded worldwide totals trillions more.

(Ralph Nader, ^œRalph Nader on a simple way to avoid the fiscal cliff: Tax stock trades, *Washington Post* Saturday, December 1, 2012)

The ^œTriennial Central Bank Survey of foreign exchange turnover in April 2013 provided a picture of the size of Foreign Exchange and OTC Derivatives Markets activity:

¹ The index ranges from 0 to 10,000, where a lower number indicates that there are many dealers with similar market shares (as measured by notional principal) and a higher number indicates that the market is dominated by a few reporting dealers. ² Foreign exchange forwards, foreign exchange swaps and currency swaps.

(^œBIS Statistics: [Charts](#), Derivatives Statistics: Graph D8, p. A16)

As it explained:

The preliminary ^œglobal results from the 2013 Triennial Central Bank Survey of Foreign Exchange and OTC Derivatives Markets Activity show that trading in foreign exchange markets averaged \$5.3 trillion per day in April 2013. This is up from \$4.0 trillion in April 2010 and \$3.3 trillion in April 2007. FX swaps were the most actively traded instruments in April 2013, at \$2.2 trillion per day, followed by spot trading at \$2.0 trillion.

(BIS, 5 September 2013.

See, ^œ[Triennial Central Bank Survey of foreign exchange and derivatives market activity in 2013](#), updated 7 November 2013, for more detail.

The 2013 Triennial Survey was published in the December 2013 issue of the ^œ[BIS Quarterly Review](#).)

Government decisions around the world are increasingly made with an eye to 'market response' to their policies, and news bulletins almost obsessively report 'market fluctuation' based on reactions to policy decisions, or even to chance comments by politicians. And financial markets, conversely, react to such reports of their own responses, thus magnifying short-term investment responses to often marginally important (and sometimes barely relevant) government activity.

'Entrepreneurs', since the 1980s, are not 'industrialists' but players in international currency, bond and stock trading and [experts in financial manipulation](#) ⁵²⁰. They know a great deal more about Wall Street possibilities than about new productive enterprise ⁵²¹.

Things have not improved in the 21st century. Movements in share and currency values usually have [little to do with the world of productive enterprise](#). They are all-too-often driven by wild and fanciful speculations of 'expert commentators', self-interested predictions of predators in the 'marketplace of finances', and fanciful tales spun by purveyors of 21st century snake-oil ⁵²².

Transient Benefits of Globalization 🌐

 (29/01/16) (19/10/18)

Effectively, in the short-term, what the removal of tariff barriers in the 1980s did was to transfer the difference in wage rates between laborers in First World and Third World countries into the pockets of those who retained their employment, and therefore their incomes, in First World countries ⁵²³.

For the bulk of the population, the lowering of prices meant an increase in discretionary income. This allowed middle-income earners to join in the new speculative investment boom of the 1980s. This, in turn, gave them a vested interest in changes in working conditions which might positively contribute to increased investment returns.

That, of course, led them to support arguments for further deregulation and 'streamlining' of business, reduction in government expenditures and taxation 'relief'.

The transfer of income from low to middle wage earners resulted in a transient sense of affluence. Consequently, there was less pressure on employers to give regular wage increases to provide increased income for expanding wants and needs during the first years of this transfer of work to Third World communities.

In the 1980s real wages grew more slowly in First World countries (In the US, for 80% of the male workforce and 50% of all workers, real wages fell through the period)⁵²⁴. As Josh Bivens, Lawrence Mishel, and John Schmitt have explained for the US,

...[R]elative employer power in the labor market has indeed increased substantially in recent decades, but the source of this growth is not predominantly explained by growing labor market concentration - it is instead explained by an intentional policy assault on the market power of American workers.

(Josh Bivens, Lawrence Mishel, and John Schmitt, ^œ[It's not just monopoly and monopsony](#): How market power has affected American wages, p.11, *Economic Policy Institute*, April 25, 2018)

Not only did real wage returns fall for more than 50% of workers in the US (a result experienced by workers in most other Western communities), for those who initially benefitted from this transfer in wealth, an expansion in discretionary income was followed by an expansion in perceived needs. As the initial flush of felt prosperity waned, more and more middle-income earners accepted neoliberal arguments for 'governmental downsizing' and tax reform, aimed at providing them with further discretionary income.

 (25/08/16)

In a time when wage increases had become closely linked with increases in 'productivity', that is with increases in company profits resulting not from price increases but from an improved ratio between wage costs and material output (e.g. [German experience](#)), one way of expanding incomes was through reducing government taxes and charges - introducing 'user-pays' schemes which placed the same demands on all people, regardless of income.

 (04/11/18)

This new emphasis on reductions in government spending, once again effectively shifted income from low-wage to middle- and high-wage individuals⁵²⁵. This resulted in further widening the gap between low-wage earners and middle- and upper-income earners⁵²⁶.

As Mishel and Bivens (2011) explained,

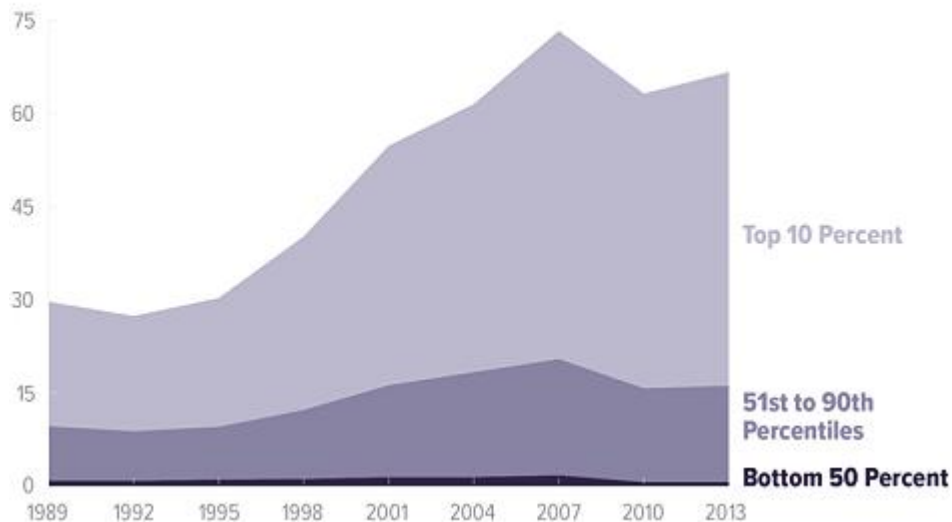

The bottom 60 percent of households actually had less wealth in 2009 than in 1983, meaning they did not participate at all in the growth of wealth over this period.

(^œ[Occupy Wall Streeters are Right About Skewed Economic Rewards in the United States](#). *Economic Policy Institute* Briefing Paper No.331)

A report by the US Congressional Budget Office illustrated the shift in wealth distribution in the United States over the period 1989 to 2013.

Holdings of Family Wealth

Trillions of 2013 Dollars

As the report says,

Over the period from 1989 through 2013, family wealth grew at significantly different rates for different segments of the U.S. population. In 2013, for example:

- The wealth of families at the 90th percentile of the distribution was 54 percent greater than the wealth at the 90th percentile in 1989, after adjusting for changes in prices.
- The wealth of those at the median was 4 percent greater than the wealth of their counterparts in 1989.
- The wealth of families at the 25th percentile was 6 percent less than that of their counterparts in 1989.

The distribution of wealth among the nation's families was more unequal in 2013 than it had been in 1989. For instance, the difference in wealth held by families at the 90th percentile and the wealth of those in the middle widened from \$532,000 to \$861,000 over the period (in 2013 dollars). The share of wealth held by families in the top 10 percent of the wealth distribution increased from 67 percent to 76 percent, whereas the share of wealth held by families in the bottom half of the distribution declined from 3 percent to 1 percent.

(US Congressional Budget Office, [Trends in Family Wealth, 1989 to 2013](#), August 18, 2016)

In the 1980s, Western middle-income earners experienced a sense of affluence at the very time that unemployment statistics showed a rapid growth in the numbers of people who could no longer find work, and in the numbers of those who had to accept lower wages and deteriorating work conditions in order to retain employment.⁵²⁷

This, in turn, lessened the sense of threat amongst the more articulate members of Western communities which would otherwise have accompanied a rise in unemployment statistics in the community. Those most directly affected by the changes could, therefore, find little support from the bulk of the population.

Not even the labor unions, which were trapped by the dual effects of this shift, could mount an effective campaign against the relocation of industry

and deteriorating work conditions for low-paid workers. Labor leaders found that they simply could not motivate the majority of Western employees in the face of their new-found affluence ⁵²⁸.

Over time, however, the savings which middle-income earners had experienced with the lowering of tariff barriers, were whittled away. The wants of those whose real incomes had been improved by the import of low-wage manufactures expanded, so that, over time, the requirements of such people became greater, effectively reducing their discretionary incomes.

Now, First World countries had lost their labor-intensive industries - or had mechanised them, or had established 'informal sweat-shops' in which people are subjected to 'Third World conditions and pay' - and the initial advantages to consumers which had accrued from the internationalization of competition began to disappear. ⁵²⁹

Public-Private Partnership: We need to 'Stimulate' Private enterprise

(04/09/17) (24/01/18) (23/02/18) (03/07/18) (02/12/18)

The lowering of tariff barriers in First World countries and the resulting distortion of First World economies gave doctrinaire, right-wing economic experts a platform from which to argue for drastic reformation of First World economies.

Pointing to the distortions and their effects, right-wing politicians argued that the burgeoning unemployment and its side effects in increased crime, increased youth unemployment, and ghettoizing of low-waged residential districts were the result of economic distortion *within* First World countries.

It was argued that well-meaning, but short-sighted governments had expanded governmental services beyond the capacity of their economies to absorb the associated costs ⁵³⁰. The only way in which First World countries could regain the economic initiative would be for governments to step back from their failed attempts at 'economic management' and allow 'market forces' to rectify the problem. As [Herbert Spencer](#) put it, "There is No Alternative' (TINA) (*Social Statics* (1851), pp. 42, 307) ⁵³¹.

High on the lists of remedies for unemployment and the renovation of economies were:

- ★ the establishment of 'individual contracts';
- ★ the removal of 'collective bargaining' by workers;
- ★ the lowering of minimum wage rates ⁵³² ;
- ★ the watering down of maximum hour rates;
- ★ the removal of price protection;
- ★ and the scaling down of social welfare benefits.

All those provisions which had been central to the 1930s 'New Deal' in the USA and which had been echoed in other Western countries were now under attack as 'economic luxuries' which no country could permanently afford. ⁵³³

Ronald Reagan, in his inaugural address had set the scene for what has followed:

...These United States are confronted with an economic affliction of great proportions. We suffer from the longest and one of the worst sustained inflations in our national history. It distorts our economic decisions, penalizes thrift, and crushes the struggling young and the fixed-income elderly alike. It threatens to shatter the lives of millions of our people.

Idle industries have cast workers into unemployment, human misery, and personal indignity. Those who do work are denied a fair return for their labor by a tax system which penalizes successful achievement and keeps us from maintaining full productivity.

But great as our tax burden is, it has not kept pace with public spending. For decades we have piled deficit upon deficit, mortgaging our future and our children's future for the temporary convenience of the present. To continue this long trend is to guarantee tremendous social, cultural, political, and economic upheavals.

You and I, as individuals, can, by borrowing, live beyond our means, but for only a limited period of time. Why, then, should we think that collectively, as a nation, we're not bound by that same limitation? We must act today in order to preserve tomorrow. And let there be no misunderstanding: We are going to begin to act, beginning today. ..

In this present crisis, government is not the solution to our problem; government is the problem.

(Ronald Reagan: "œ[Inaugural Address](#)," January 20, 1981. Online by Gerhard Peters and John T. Woolley, *The American Presidency Project*)

In 2017, the process and its 'justifications' remain potent. The self-proclaimed political 'centrist', French President Emmanuel Macron, has demonstrated this in his 'reformation' of French labor relations. As Juliette Legendre has described⁵³⁴:

His first year of presidency... has proven that he is neither a centrist nor an avant-garde leader, but rather an old-fashioned, right-leaning neoliberal determined to overhaul France's hard-won social model under the guise of modernism and emancipation.

Cole Stangler explained:

Give him credit for consistency at least. Amid all the equivocations shaping his career, French President Emmanuel Macron has remained singularly committed to the cause of remaking labor law to favor employers. Since his Socialist predecessor, François Hollande, appointed him economy minister in 2014, the former investment banker has repeatedly argued that France must reform its labor code along pro-business lines in order to boost job growth. And on August 31, his recently elected government unveiled a long-awaited proposal to do so.

As Macron's prime minister, Edouard Philippe, put it, the reforms are a "necessary" tool to reduce unemployment, which currently stands at 9.5 percent. If this is the goal, success may be partial at best. œ[Similar efforts](#) in the world's most highly developed countries have cast doubt on the supposed link between labor deregulation and job growth.

But even if they do bring down unemployment, the reforms are likely to be overshadowed by the grave consequences at the workplace and

damage to the country's social fabric. At their core, the proposed changes weaken unions' collective-bargaining rights and make it easier for companies to lay off workers....

Compared with the pro-business employment model that prevails in the United States, the government's reforms may seem modest. But they strike at the foundation of the French system, which seeks to provide workers with a more level playing field for their negotiations with employers.

(Cole Stangler, ^œ[The False Promise of Macron's Labor Reforms](#): The French president's proposed labor code would have grave consequences for workers, *The Nation*, September 22, 2017)

 (25/04/18)

In the climate of reform engendered by neoliberal arguments, rather than economic enterprises contributing to government social welfare expenditures, the emphasis has been reversed. Government should provide stimulus to private enterprise. Nathan Jensen has described the US scene in 2018:

Every year, states and local governments give economic-development incentives to companies to the tune of between \$45 billion and \$80 billion. Why such a wide range? It's not sloppy research; it's because many of these subsidies are not public.

For the known subsidies, such as Maryland's recent ^œ[\\$8.5 billion incentive bid](#) for Amazon's second headquarters, the support includes cash grants for company relocations, subsidized land, forgiving company taxes on everything from property taxes to sales taxes and investments in infrastructure for the company. Maryland is even offering to give 5.75 percent of each worker's salary back to the company, which is the maximum state income tax rate for individuals. Employees will pay taxes that will be ^œ[routed back to Amazon](#)....

Economic development all across the country is getting less open - and both Democrats and Republicans are doing it. In fact, in many cases, the politicians themselves aren't even the ones negotiating for the public....

(Nathan M. Jensen, ^œ[Do Taxpayers Know They Are Handing Out Billions to Corporations?](#) *New York Times*, April 24, 2018)

Mitchell and Manning (1991) explained the 1980s move to privatize and [corporate](#) Government:

During the Reagan administration, the ideas of privatization, deregulation, and public-private partnerships became entwined in the USA, as they had during the Thatcher years in Great Britain ...

They are the primary components of an industrial policy founded in what has come to be called *neo-orthodox economics*. Along with supposedly tight fiscal policies and judicious monetary policy, they make up the core of both the Thatcher and Reagan approaches to promoting economic growth and development by unleashing the powers of the private marketplace ...

[With the emergence of the Third World 'Debt Crisis' in the mid-1980s, the OECD, UN, World Bank and IMF provided policy direction to Third World countries.]

Their prescription for Third World governments, *economic adjustment*, was drawn directly from the Thatcher/Reagan doctrines of neo-

orthodox economics: cutbacks in public expenditures, privatization, deregulation, and public-private partnerships [PPP].

New loans from the Bank or the IMF today enforce the adoption of such policies ... and the USA Agency for International Development [US AID] promotes public-private partnerships as the key to achieving higher rates of economic growth ...

PPPs themselves, rather than being the centrepiece of a development strategy, are primarily a set of institutional relationships between the government and various actors in the private-sector and civil society ...

In the typical confusion of terms, US AID and other donor agencies promote privatization and government subsidies to private entrepreneurs in the name of building public-private partnerships ...

But privatization is privatization and subsidies are subsidies; public-private partnerships they are not.

(Mitchell & Manning 1991, pp. 46-9)

Under the New Deal, private enterprises were required to incorporate a public social welfare component into the costs of production. However, under neoliberal direction in the 1980s and 1990s, the 'public-sector' provided 'incentives' to private enterprise, believing that such stimulation of industry was needed to ensure a growth in employment and therefore increased social welfare⁵³⁵.

In 2018 Public-Private Partnership deals are in the process of morphing into Private Enterprise capture of the public realm.

Danny Westmeat, *Seattle Times* staff columnist, in an article entitled 'This City Hall, brought to you by Amazon', describes the local and regional government bidding process instituted by Amazon for its 'new, proposed 50,000-employee HQ2'. As he says,

...There's rising worry that corporations are taking over America. But after reviewing a slew of the bids by cities and states wooing Amazon's massive second headquarters, I don't think "takeover" quite captures what's going on.

More like "surrender."

Last month Amazon announced it got 238 offers for its new, proposed 50,000-employee HQ2. I set out to see what's in them, but only about 30 have been released so far under public-record acts.

Those 30, though, amply demonstrate our capitulation to corporate influence in politics. There's a new wave, in which some City Halls seem willing to go beyond just throwing money at Amazon. They're turning over the keys to the democracy....

Example: Chicago has offered to let Amazon pocket \$1.32 billion in income taxes paid by its own workers. This is truly perverse. Called a personal income-tax diversion, the workers must still pay the full taxes, but instead of the state getting the money to use for schools, roads or whatever, Amazon would get to keep it all instead.

"The result is that workers are, in effect, paying taxes to their boss," says a report on the practice from Good Jobs First, a think tank critical of many corporate subsidies.

Most of the HQ2 bids had more traditional sweeteners. Such as Chula Vista, California, which offered to give Amazon 85 acres of land for free

(value: \$100 million) and to excuse any property taxes on HQ2 for 30 years (\$300 million). New Jersey remains the dollar king of the subsidy sweepstakes, having offered Amazon \$7 billion to build in Newark.

But more of a bellwether to me are proposals that effectively would put Amazon inside the government.

Some are small. Boston has offered to set up an "Amazon Task Force" of city employees working on the company's behalf. These would include a workforce coordinator, to help with Amazon's employment needs, as well as a community- relations official to smooth over Amazon conflicts throughout Boston. (Surely Amazon can handle these things itself?)

But the most far-reaching offer is from Fresno, California. That city of half a million isn't offering any tax breaks. Instead it has a novel plan to give Amazon special authority over how the company's taxes are spent....

(Danny Westmeat, ^œ[This City Hall, brought to you by Amazon](#), *Seattle Times*, Originally published November 24, 2017; Updated December 28, 2017)

Kenneth Thomas has explained the outcome of Amazon's self-promotional orchestration of competition between US city governments for the dubious 'privilege' of hosting an Amazon Headquarters: New York City and Arlington, Virginia (why stop at one when city governments are so desperate to subsidize private enterprise?):

Well, what did you expect? With 238 entrants and 20 finalists, the Amazon HQ2 location tournament resulted in a resounding victory for Amazon: Billions of dollars in subsidies and binders full of detailed information on the contestants. Plus, we got a surprise twist at the end, when Amazon announced it would choose two "headquarters" instead of one. Of course, I never thought that having two headquarters made economic sense ("Doesn't that defeat the idea of a headquarters as a central coordinating site?" I asked last year), and the same is even truer when you have three "headquarters."

(Kenneth Thomas, ^œ[Amazon Wins!!!](#), *Angry Bear*, November 30, 2018)

(For a picture of what is happening in this emerging [corporatized](#) United States of America, see '^œ[Amazon Killer?](#)' posted by Yves Smith on the blog site *Naked Capitalism*, January 23, 2018)

At the same time, the social welfare costs of the past became illegitimate imposts which made productive enterprises uncompetitive and so cost jobs.

Social welfare imposts were, according to the new logic of the 1990s, counterproductive. Instead of promoting social welfare they created unemployment and consequent social misery.

By sleight of hand, social welfare demands made of economic enterprises were considered irresponsible, but the tapping of public resources by private enterprises was considered socially responsible⁵³⁶.

Private businesses were now competing with businesses which were able to tap the resources of countries where no social welfare component was included in production. So, Western enterprises should be compensated by government for any continuing residual social welfare costs associated with production (see [Conglomerates and the Progressive modernization of Poverty](#) for more on the consequences of this activity over the past half century).

Only in this way could governments ensure that enterprises based within their territories were able to compete 'on a level playing field' with those based in Third World territories where they not only had few, if any, social welfare imposts, but were also publicly subsidised through a range of 'incentives' in order to ensure that they remained in the territory ⁵³⁷.

The Twilight of Western Hegemony? 🇺🇸

 (22/05/22) (11/06/22) (13/06/22) (23/06/22) (25/07/22) (13/08/22) (17/08/22) (24/09/22) (26/09/22) (05/10/22) (06/10/22) (26/12/22) (27/12/22) (10/07/23) (05/03/24) (10/04/24) (15/04/24)

In a vain attempt to maintain its unipolar hegemony within the world, The United States of America, seeing itself as being in an existential battle against the world's emerging 'autocracies', is decoupling from the non-Western world, vassalizing the rest of 'The West'. [The Western World](#) is cannibalizing itself.

Thomas Fazi, in 2023, described what was happening:

For decades, the European Union was regarded as an emerging counterweight to US geopolitical hegemony that would accord its member states greater autonomy from the superpower across the Atlantic. The Russia-Ukraine conflict has revealed the emptiness of this promise. Today, Europe's "vassalization" (in the words of an analyst for the European Council on Foreign Relations) is arguably more pronounced than at any time since the middle of the 20th century. On geopolitical questions, as the current war has made clear, Brussels has no meaningful independence from Washington. In the economic sphere, Europe's relative decline and growing dependency on America - which predate the Ukraine conflict but have been exacerbated by it - are if anything even more evident.

In 2008, the European Union's economy was slightly larger than America's; America's economy in 2023 is one-third larger than those of the European Union and Britain combined, and 50 percent larger than that of the European Union without the United Kingdom. To put it differently, the eurozone's economy has grown about 6 percent over the past 15 years, compared with 82 percent for the United States, according to data from the International Monetary Fund.

The economic fortunes of the European Union and the United States had already started to diverge well before the Ukraine conflict for several reasons, not least Europe's post-2008 suicidal austerity policies, which led to a continent-wide demand and investment collapse. Over the past year and a half, however, this process has undergone a dramatic acceleration. Unlike America, Europe has suffered a huge economic blowback from the conflict - or more precisely, from the West's response, especially its decoupling from Russian gas, which before the war accounted for almost half of the bloc's demand. This drastic move led to a "massive and historic energy shock," as the Organization for Economic Cooperation and Development put it, exacerbated by speculation on the part of the big energy companies, which crippled industry and households alike. According to *The Economist*, high energy prices killed 68,000 people among Europe's poorest last winter - as European countries turned to much more expensive liquefied natural gas from Qatar and especially the United States.

Last year, soaring energy prices and falling demand caused dozens of plants across a diverse range of energy-intensive industries - glass, steel, aluminum, zinc, fertilizers, chemicals - to cut back production or shut down, which, in turn, led to mass layoffs. In September, *The New York Times* documented the "crippling" impact that Brussels's sanctions were having on industry and the working class in Europe, reporting that "high energy prices are lashing European industry, forcing

factories to cut production quickly and put tens of thousands of employees on furlough."...
(Thomas Fazi, [∞][America Is Deindustrializing Europe](#), *Compact*, August 09, 2023)

Dmitry Medvedev provided a non-Western description of it all:

The years 2022-2023 will go down in history as a time of a powerful civilizational rift, the peak of the existential crisis of mankind in the XXI century.

Its direct consequence was the start of a special military operation in Ukraine. Russia was forced to hold it in order to protect its sovereignty and territorial integrity, the security of millions of citizens. Our country, as you know, exercised its right to self-defense, relying on Article 51 of the UN Charter.

What is happening now in Ukraine and Donbass is not just a "regional conflict", but something completely different. This is an all-out confrontation between the conditional collective West and the rest of the world.

It is caused by the diametrical opposition of views on the further development of mankind.

On one side are Western countries that do not want to admit that the world has changed radically and lose their dominance. The hybrid war that they are now waging with us is their last chance to maintain a favorable status quo for themselves, not to lose weakened power and influence.

On the other side is not only Russia, but also the global East and South. Their population is almost two-thirds of the globe. These are countries that continue to gain strength, gradually overcoming the economic and political consequences of the colonial past. They stand for the equitable development of all states. Without senior and junior partners. Without a cynical division into historically developed and underdeveloped countries. On "genuine" democracies" and "authoritarian regimes", from the point of view of the West, of course.

Their desire for independence is very disliked by the former colonialists. They cling to the past with all their might. The new conflict has already caused an order of magnitude more tension than during the previous Cold War and extremely negative consequences. In fact, [it has] put the world on the brink of a third world war.

Moreover, with the beginning of the conflict in Ukraine, at the suggestion of the United States, a full package of "double standards" was again launched.

Nothing new, everything is as usual: independence and territorial integrity, according to the collective West, can only be defended by those who are highly allowed to do so. The rest should be pacified, crushed, and preferably smeared on their own territory with bloody scraps....

The tectonic rift that has formed in the understanding of the future in different parts of the world will only worsen. You don't have to be a visionary to understand that the confrontation phase will be very long. The confrontation will last for decades.

One of the ways to resolve it is [a] third world war. ...
(Dmitry Medvedev, ^œ[The era of confrontation](#), *Rossiyskaya Gazeta*,
July 02, 2023 [Russian - machine translation])

As we have seen, over the past five hundred years, Western Europe and its ideological offspring have been in hegemonic control. They have changed the face of the world.

Convinced of their 'right to rule' they have presumed that they have a God-given responsibility to ensure the 'development' of the world and its vassalage to the [21st Century center of Western Hegemony](#), the United States.

The world has found itself described in terms of its (dis)similarity to those who have colonized it, with its peoples reclassified as 'lesser humans' in need of 'civilization' by Western 'authorities'. The colonized have been subjected to 'domestication', educated to 'serve' Western superiors and Western Interests.

And, as they have been 'granted' putative independence, they have found their nations classified as 'undeveloped', 'less developed', 'under developed' and 'developing'. Terms directly comparing their 'state of development' to that of the 'developed' West.

The West has accepted another 'white man's burden': to ensure that all nations of the world [become clones of the West](#).

And, in order to ensure that they achieve that exalted status, Western nations have committed themselves to 'aiding' them through Western style 'education' and 'development' programs, Western 'aid organizations', and 'foreign direct investment' from Western private enterprises in 'public-private' partnerships putatively aimed at economic and industrial development, but resulting in nations restructured to 'serve' Western Interests and Western corporations.

As [Kwame Nkrumah described](#),

... [T]he methods of neo-colonialists are subtle and varied. They operate not only in the economic field, but also in the political, religious, ideological and cultural spheres...

Under cover of such phrases, however, it devises innumerable ways to accomplish objectives formerly achieved by naked colonialism. It is this sum total of these modern attempts to perpetuate colonialism while at the same time talking about 'freedom', which has come to be known as neo-colonialism.

But, in 2022 the hubristic self-belief and self-promotion of The West might finally have triggered change. The 21st Century might, indeed, be the twilight century of Western Hegemony.

The behavior of the United States toward Russia⁵³⁸ in the third decade of the 21st Century has been that of a nation which believes itself to be both morally superior and justifiably in control of the world, able to enforce compliance with a 'rule of law' sustained and modified as required by itself⁵³⁹.

In 2022, [Russia found itself at war with 'The West'](#). President Putin, explaining to the Russian people why a partial mobilization of military trained and combat seasoned reservists was necessary in September 2022, also explained why it was at war:

The subject of this address is the situation in Donbass and the course of the special military operation to liberate it from the neo-Nazi regime, which seized power in Ukraine in 2014 as the result of an armed state coup.

Today I am addressing you - all citizens of our country, people of different generations, ages and ethnicities, the people of our great Motherland, all who are united by the great historical Russia, soldiers, officers and volunteers who are fighting on the frontline and doing their combat duty, our brothers and sisters in the Donetsk and Lugansk people's republics, Kherson and Zaporozhye regions and other areas that have been liberated from the neo-Nazi regime.

The issue concerns the necessary, imperative measures to protect the sovereignty, security and territorial integrity of Russia and support the desire and will of our compatriots to choose their future independently, and the aggressive policy of some Western elites, who are doing their utmost to preserve their domination and with this aim in view are trying to block and suppress any sovereign and independent development centres in order to continue to aggressively force their will and pseudo-values on other countries and nations.

The goal of that part of the West is to weaken, divide and ultimately destroy our country. They are saying openly now that in 1991 they managed to split up the Soviet Union and now is the time to do the same to Russia, which must be divided into numerous regions that would be at deadly feud with each other.

They devised these plans long ago. They encouraged groups of international terrorists in the Caucasus and moved NATO's offensive infrastructure close to our borders. They used indiscriminate Russophobia as a weapon, including by nurturing the hatred of Russia for decades, primarily in Ukraine, which was designed to become an anti-Russia bridgehead. They turned the Ukrainian people into cannon fodder and pushed them into a war with Russia, which they unleashed back in 2014. They used the army against civilians and organised a genocide, blockade and terror against those who refused to recognise the government that was created in Ukraine as the result of a state coup.

After the Kiev regime publicly refused to settle the issue of Donbass peacefully and went as far as to announce its ambition to possess nuclear weapons, it became clear that a new offensive in Donbass - there were two of them before - was inevitable, and that it would be inevitably followed by an attack on Russia's Crimea, that is, on Russia.

In this connection, the decision to start a pre-emptive military operation was necessary and the only option. The main goal of this operation, which is to liberate the whole of Donbass, remains unaltered.

(President of Russia, [∞][Address by the President of the Russian Federation](#), September 21, Moscow, Kremlin)

John Helmer explained [what this 'war' is all about](#):

There's no mystery now about the war of Europe and North America against Russia; it is the continuation of Germany's war of 1939-45 and the war aims of the General Staff in Washington since 1943....

(John Helmer, [∞][AND THEN THERE WERE NONE](#), *Dances with Bears*, September 22, 2022)

But, of course, this behavior is not in any way 'new'.

The Western World has for more than 500 years behaved in similar fashion.

Alexander Gabuev, in a *Foreign Affairs* article entitled 'Putin and Xi's Unholy Alliance: Why the West Won't Be Able to Drive a Wedge Between Russia and China', explained the West's presumption of the nature of the 'emerging partnership between China and Russia' which

...was doomed to fail because ties between the two Eurasian giants would always be undercut by the growing power asymmetry in China's favor, the lingering mistrust between the two neighbors over a number of historical disputes, and the cultural distance between the two societies and between their elites. No matter how hard Russian President Vladimir Putin might try to woo the Chinese leadership, the argument went, China would always value its ties to the United States and to U.S. allies over its symbolic relations with Russia, while Moscow would fear a rising Beijing and seek a counterbalance in the West.

Even as China and Russia have grown significantly closer, officials in Washington have remained dismissive. "They have a marriage of convenience," U.S. Secretary of State Antony Blinken told U.S. senators in March 2023 during Chinese leader Xi Jinping's state visit to Moscow. "I am not sure if it is conviction. Russia is very much the junior partner in this relationship."...

And so, despite the 'vassalage' of Russia to China, our Western 'foreign affairs expert' assures his readers that

...The tightening of this alignment between Russia and China is one of the most important geopolitical outcomes of Putin's war against Ukraine. The conscious efforts of Xi and Putin drive much of this reorientation, but it is also the byproduct of the deepening schism between the West and both countries. Western officials cannot wish this axis away, hoping in vain that the Kremlin bridles at its vassalage to Zhongnanhai or making futile attempts to drive a wedge between the two powers. Instead, the West should be prepared for an extended period of simultaneous confrontation with two immense nuclear-armed powers.

(Alexander Gabuev, ^œ[Putin and Xi's Unholy Alliance: Why the West Won't Be Able to Drive a Wedge Between Russia and China](#), *Foreign Affairs*, April 9, 2024).

As Gabuev says, the West, particularly its hegemonic center, the United States, has, over the past three decades, hubristically, delusionally, presumed that any alliance 'between the two Eurasian giants would always be undercut by the growing power asymmetry in China's favor, the lingering mistrust between the two neighbors over a number of historical disputes, and the cultural distance between the two societies and between their elites.'

The West, for reasons anchored in their colonizing experience, seem unable to comprehend a partnership based on an acceptance of a new multipolar alliance of 'countries [which] are [finally ready to free themselves from all those \[colonizers'\] narratives](#) and to recognize that there's something inherently good and valuable and cherishable in their own history, their own national character and their own manifest destiny because all the nations of the world have something unique and something special to offer - if the international environment supports that'.

One should not view US hegemony as a 20th or 21st century phenomenon.

The United States is merely the most recent center of Western capitalism, the latest (and perhaps last) focus of Western hegemony⁵⁴⁰.

And, inevitably, given that the West is [premised on capitalist control of the world](#), that control has been focused and maintained through financial and industrial control of the world's resources.

What is 'new' (at least since the mid-1970s) is the [decentralization of industrial activity](#), 'off-shoring' industrial activity and [relying on financial controls](#) in maintaining and asserting its hegemony.

Through offshoring most of its non-military industrial base, the United States has become dependent on a smoothly functioning global transport system in ensuring its 'needs' and 'wants'. Any disruption of supply chains exposes it to supply shortages and consequent short-term price fluctuations⁵⁴¹.

The decoupling of the [privatized financial control of the world's resources](#) from industrial control of resource flows through offshoring has exposed the fragile nature of Western capitalism and Hegemony.

The post-1960s neoliberal drive to privatization of ownership of the world's resources is underwritten by the current world financial system. Any shift to alternative financial systems weakens financial institutions defined in terms of the displaced Western system.

If that shift is coupled with re-nationalization of the internal resources of sovereign nations to regain control of their own economies (reversing the privatizations of colonialism and of the past fifty and more years) the financial dominance of Western nations and oligarchies would be greatly weakened.

By reasserting their sovereign right to control their own resources, dismantling the [internationalized, private resource ownerships and managements](#) established through Western colonialism, post-colonial nations could, at last, break free of the neo-colonial financial parasitism imposed by neoliberally driven privatization of their economies.

Without that decoupling from Western financial overlords, many post-colonial nations will remain under Western hegemonic control.

Syrian President Bashar al-Assad, in an interview with *RT Arabic* (10th June, 2022) entitled ["Our weapon is the truth": Assad in an interview with RT Arabic - about Russia, Syria and the arrogance of the West](#), explained the emergence of United States' 'Dollar' Control of the world:⁵⁴²

The US [runs consistent dollar trade deficits](#) with many other nations because of the internationally privileged position of the US dollar, derived from the [Bretton Woods Regime](#). This cemented the US dollar as the *de facto* reserve currency required to maintain the dollar parity of foreign countries which, [as France argued in 1965](#), 'amounted to automatic low-interest, dollar-denominated loans to the U.S'.⁵⁴³

The default position of a 'reserve currency' sovereign nation, at the center of an international network of trade, providing the liquidity needed to ensure a free-flow of credit between trading entities, as France observed, privileges that nation. However, its position ultimately relies on separating its political and strategic interests and ambitions from its efficient management of the reserve currency⁵⁴⁴.

Failure to maintain that separation will, inevitably, result in loss of international confidence in the reserve currency and consequent challenges to its privileged position.

As Syrian President Bashar al-Assad put it, nations will come to regard the US dollar as 'pieces of paper that have no price'!

Anne-Marie Slaughter and Elina Ribakova have explained the 2019 risks of reserve-currency-based 'sanctions' threatened by the US Administration against those trading entities which do not support its [political and military adventures](#) around the world:

In today's world, access to global networks is a critical source of power, but the resulting interdependence can also generate vulnerability. The power flows from centrality: being a hub that connects all (or most) other nodes. The threat of denying access to such hubs can be a powerful sanction against bad actors. But if that power is abused - if asymmetrical interdependence is weaponized - participants in a network may decide to create alternative networks of their own.

That is the risk the United States is currently running. It holds the world's principal reserve currency and enjoys a central role in global financial networks. But it is using that position to pursue foreign-policy goals that are likely to weaken its centrality, and thus its leverage over the long term.

A prime example is the mounting crisis with Iran, which started in May 2018, when the US unilaterally withdrew from the 2015 nuclear deal, known officially as the Joint Comprehensive Plan of Action (JCPOA). Worse, the US has since imposed its decision on the other signatories - Britain, France, Russia, China, Germany, and the European Union - by threatening secondary sanctions against third parties honoring the JCPOA.

In theory, the remaining parties to the JCPOA should have been able to continue doing business with Iran. But the US, invoking a cooperation agreement with the EU that was originally designed for the fight against al-Qaeda, has been able to enforce its secondary sanctions through the Belgium-based Society for Worldwide Interbank Financial Telecommunication (SWIFT).

Under pressure from the US, SWIFT has had to bar Iranian banks from the global payments system it oversees, effectively locking Iran out of the global financial system and curtailing its ability to conduct business even with countries that have not sanctioned it.

Like many European companies, SWIFT has a legal presence and a data center in the US. Had it refused to comply, it could have faced significant fines, the loss of US visas for its staff, or a denial of access to US dollars....

(Anne-Marie Slaughter and Elina Ribakova, ^œ[Post-American Networks](#), *Project Syndicate*, Jul 22, 2019)

There are many advantages enjoyed by a reserve currency sovereign nation from its position at the hub of international trade⁵⁴⁵ but those advantages ultimately depend on the US not abusing its position. As Slaughter and Ribakova say,

If asymmetrical interdependence is weaponized - participants in a network may decide to create alternative networks of their own.

In 2022, as in the previous decade, the United States has done just that! It has myopically gambled its power at the center of the Western dominated global financial system in order to 'bring Russia (and one presumes, later, China) to its knees'

It takes time, patience, and careful planning, but the US position at the hub of international trade, once successfully challenged, can quickly erode⁵⁴⁶. It took four years of backroom diplomacy and meticulous preparation, but, in 2020, Iran and China were in a position to do just that.

Farnaz Fassihi and Steven Lee Myers (in a *New York Times* essay which, predictably, conflates economic and social cooperation - excluding US involvement - with military ambition, creating 'new and potentially dangerous flash points in the deteriorating relationship between China and the United States') explained:

Iran and China have quietly drafted a sweeping economic and security partnership that would clear the way for billions of dollars of Chinese investments in energy and other sectors, undercutting the Trump administration's efforts to isolate the Iranian government because of its [US asserted] nuclear and military ambitions.

The partnership, detailed in an 18-page proposed agreement obtained by The New York Times, would vastly expand Chinese presence in banking, telecommunications, ports, railways and dozens of other projects. In exchange, China would receive a regular - and, according to an Iranian official and an oil trader, heavily discounted - supply of Iranian oil over the next 25 years....

If put into effect as detailed, the partnership would create new and potentially dangerous flash points in the deteriorating relationship between China and the United States.

It represents a major blow to the Trump administration's aggressive policy toward Iran since abandoning the nuclear deal reached in 2015 by President Obama and the leaders of six other nations after two years of grueling negotiations.

(Farnaz Fassihi and Steven Lee Myers, ^œ[Defying U.S., China and Iran Near Trade and Military Partnership](#), *New York Times*, July 11, 2020)

Iranian reaction to overblown extrapolations by Western commentators, attempting to paint this agreement as a challenge to US military hegemony, put it into perspective:

Foreign Ministry spokesman Abbas Mousavi has criticized the disinformation campaign surrounding the Iran-China partnership plan, saying the old trick of spreading lies to gain true information will lead nowhere.

In a tweet on Tuesday, Mousavi lauded the comprehensive cooperation plan, describing it as a clear roadmap and principled guide for relations between the two major countries in the future world.

He said China, as the world's leading economic power in the near future, and Iran as the great power in West Asia, can counter the pressure of bullies with complementary relationship and ensuring common interests.

"There is no ceding of the Iranian islands, nor the presence of the foreign military forces, nor any other illusions," the spokesman explained.

Meanwhile, Foreign Minister Mohammad Javad Zarif said on Sunday that there is no "hidden issue" in the long-term comprehensive agreement between Iran and China....

Zarif added, "There is transparency in our behavior, however, the truth is that power in the world is shifting (to the East) and we should know the realities of the international situation and take action in the post-West world."

Government spokesman Ali Rabiei said on June 23 that Iran and China have drafted a 25-year plan for comprehensive partnership which proves failure of the plots to isolate the Islamic Republic.

"This plan proves failure of the United States' policies to isolate Iran, sever Iran's relations with the international community and also to harm Iran's will to expand relations with other countries," Rabiei said during a press conference.

He said that the 25-year plan is based on a win-win approach which "heralds long term cooperation".

"Recognizing cultural commonalities, encouraging multilateralism, supporting equal rights of the nations and insisting on domestic development are parts of this plan," the government spokesman explained....

(^œ[Tehran dismisses rumors surrounding Iran-China partnership plan](#), *Tehran Times*, July 8, 2020)

As the US, in the runup to the 2020 presidential election, imposed yet more 'sanctions' on Iran which could effectively ^œ[lock Iran out of the global financial system](#), Iran's Central Bank countered by announcing that it has ^œ[replaced the US dollar with the yuan as its primary reserve currency](#) ⁵⁴⁷. As Lavender Au and Benjamin Wilhelm explained⁵⁴⁸,

With a 25-year strategic partnership with China under discussion, Iran will have a guaranteed market for its oil and gas exports, and with renminbi reserves, it will be able to more easily circumvent SWIFT, the messaging service used by banks around the world for money transfers.

Iran is not the only country to fall foul of a weaponized dollar - Russia, Turkey and Venezuela are also within those ranks. Aggressive U.S. sanctions have given those countries, and traders who wish to do business with them, reasons to find alternative arrangements. In China, too, there is some unease about the dollar's dominance. The vice chairman of the China Securities Regulatory Commission has said that as long as the country mainly relies on the dollar payment system, it is vulnerable to U.S. sanctions.

(Lavender Au and Benjamin Wilhelm, ^œ[U.S. Sanctions on Iran Boost China's Plans to Internationalize the Yuan](#), *World Politics Review*, Wednesday, Oct. 14, 2020)

The US President Biden, in 2021, [amplified US belligerence toward Russia](#) and, in anticipation of possible US interference in its international financial dealing, Russia began planning for means of also bypassing SWIFT, the international interbank payment system.

Russian Foreign Ministry spokeswoman Maria Sakharova, in an interview with Gabriel Gavin on *RT*, explained:

The possibility of being disconnected from SWIFT is still considered hypothetical. Nevertheless, inter-ministry work is underway to

minimize the risks and economic damage if our country's access to the usual international financial instruments and payment mechanisms is limited. The Financial Messaging System of the Bank of Russia is an example of such alternative instruments. At the moment, options for its pairing with foreign counterparts - European SEPA, Iranian SEPAM, Chinese CUP and CIPS, are being discussed...

(Maria Sakharova, ^œ[She commented on the situation with the SWIFT payment system](#), *RT (Russian)*, May 03, 2021)

The 25-year strategic partnership between Iran and China was finalized on March 27, 2021. ^œ[M. Bhadrakumar \(30 March, 2021\) summarized its content](#).

The text of the agreed document has not yet been put on public domain but broadly, we can glean from the joint statement issued on March 27 that the agreement reached during Xi's visit to increase bilateral trade to \$600 billion in the next decade has been acted upon. In fact, the joint statement begins by invoking Xi's visit.

Two supplementary documents signed by the two countries pertain to the "MOU [memorandum of understanding] on Jointly Promoting the Silk Road Economic Belt and the 21st Century Maritime Silk Road" and the "MOU on Reinforcement of Industrial and Mineral Capacities and Investment", whereby both sides "shall expand cooperation and mutual investments in various areas including transportation, railway, ports, energy, industry, commerce and services."

The joint statement says that given their relative economic advantages, both sides shall enhance their cooperation in the field of energy. Iran will supply oil and gas to China while the Chinese side "shall consider financing and investing in the up-and-downstream projects of the energy industries" in Iran.

On unravelling Hyper globalization: Trade wars are Good and Easy to Win! 🇺🇸

 (03/02/25)

Robert Samuelson addressed some of the 21st century consequences for the US of its newfound (2018) determination to redress 'trade imbalances' with other nations:

...[T]he larger threat to Trump's trade agenda is the dollar's role as the major world currency. It dictates trade policy in ways not widely understood and is the ultimate cause of chronic U.S. trade deficits.

The dollar's role as the major world currency means it's used to settle trade transactions and make cross-border investments, even when Americans are not involved. ...[T]he extra dollar demand boosts its value on foreign exchange markets. U.S. exports become more expensive and U.S. imports less so.

Trade deficits result. Since 1981, the United States has had only one current account surplus. (The current account is the broadest measure of the trade balance.)

When something continues that long, it's not an aberration. It's an integral part of the global economy. In effect, the dollar provides a service to the rest of the world.

We are compensated for this service by receiving imports greater than our exports. Many Americans benefit. Imports restrain inflation and expand consumer choice; the flows of money into dollar instruments (Treasury securities, bank deposits, stocks, bonds) tend to lower interest rates.

But there are losers: most conspicuously, U.S. farmers, manufacturers and their workers. They face tougher foreign competition in both import and export markets.

(Robert J. Samuelson, ^{ae}[Trump's no-win trade war](#), *Washington Post*, August 12, 2018)

In 2022, the United States, intent on prosecuting an 'economic war' with Russia (presumably as prelude to a similar 'war' with China) myopically decided that excluding Russia from the global, US dominated, financial system would 'bring Russia to its knees'.

In order to [make the economy of a major nation such as Russia 'scream'](#), it decided that it must go to 'sanctions' extremes greater than any it has previously employed. But, in doing so, it seems not to have considered the developments in those nations over the past decade which were the inevitable consequence of the sanctions it imposed on Iran in a futile attempt to topple its regime through excluding it from the global financial system.

In order to protect itself from economic ruin, Iran was forced into alliances with nations whose economies were strong enough and whose political systems were stable enough to provide alternatives to the Western dominated global financial system. And, as we've seen, confronted with the intellectual challenge of circumventing the strictures of global financial 'sanctions', they have been engaged in developing and implementing alternatives to the Western global system.

US hubris seems not to have anticipated this and so, with those fledgling alternative systems already viable, it has now forced Russia into relying on them and, of course, triggered the kinds of inter-national supports already being developed in its 'partner' nations.

In using its dominant position within the global financial world, it has, apparently inadvertently, fast-forwarded the development of viable alternatives required in a multipolar world.

Nicholas Mulder described what has happened:

The Russian-Ukrainian war of 2022 is not just a major geopolitical event but also a geoeconomic turning point. Western sanctions are the toughest measures ever imposed against a state of Russia's size and power.

In the space of less than three weeks, the United States and its allies have cut major Russian banks off from the global financial system; blocked the export of high-tech components in unison with Asian allies; seized the overseas assets of hundreds of wealthy oligarchs; revoked trade treaties with Moscow; banned Russian airlines from North Atlantic airspace; restricted Russian oil sales to the United States and United Kingdom; blocked all foreign investment in the Russian economy from their jurisdiction; and frozen \$403 billion out of the \$630 billion in foreign assets of the Central Bank of Russia.

The overall effect has been unprecedented, and a few weeks ago would have seemed unimaginable even to most experts: in all but its most vital products, the world's eleventh-largest economy has now been decoupled from twenty-first-century globalization.

(Nicholas Mulder, [The Toll of Economic War: How Sanctions on Russia Will Upend the Global Order](#), *Foreign Affairs*, March 22, 2022)

The post-1970s neoliberal off-shoring of production and then 'importing' its products has been an inevitable consequence of [hyper-globalization](#), the 21st century face of *laissez-faire* capitalism. This, in turn, resulted in greater international use of the US dollar to settle trade transactions and make cross-border investments. And, in turn, this maintains and enhances the relative value of US currency against other national currencies. As Samuelson puts it: 'The extra dollar demand boosts its value on foreign exchange markets. U.S. exports become more expensive and U.S. imports less so'.

In such a reorganized world the Trump instigated imposition of 'tariffs' on imports not only raises the cost of imports within the US (minimizing one of the key advantages accruing to a 'reserve currency' nation), it also directly challenges the driving presumptions of globalization policies of the past half century and more⁵⁴⁹. As Paul Krugman has explained,

...Until very recently, big business and the institutions that represent its interests didn't seem to be taking President Trump's protectionist rhetoric very seriously. After all, corporations have invested trillions based on the belief that world markets would remain open, that U.S. industry would retain access to both foreign customers and foreign suppliers.

Trump wouldn't put all those investments at risk, would he?

Yes, he would - and the belated recognition that his tough talk on trade was serious has spurred a flurry of action. Major corporations and trade associations are sending letters to the administration warning

that its policies will cost more jobs than they create. Meanwhile, the U.S. Chamber of Commerce has begun an advertising campaign to convince voters of the benefits of free trade....

The thing is, big business is reaping what it sowed. No single cause brought us to this terrible moment in American history, but decades of cynical politics on the part of corporate America certainly played an important role.

(Paul Krugman, ^œ[Big Business Reaps Trump's Whirlwind](#), *New York Times*, July 5, 2018)

In a follow-up article Krugman has cogently argued that we are no longer living in the 1950s-1960s, we now live in a complex, hyper-globalized world⁵⁵⁰:

Trump's declaration that "trade wars are good, and easy to win" is an instant classic, right up there with Herbert Hoover's "prosperity is just around the corner..."

[Of course, Trump's declaration was as attributed, Hoover's is implied from a range of comments made in speeches between 1929 and 1932]

Anatole Kaletsky has argued that:

... In principle, China can avoid any damage at all from US tariffs simply by responding with a full-scale Keynesian stimulus.

... From a Keynesian perspective, the outcome of a trade war depends mainly on whether the combatants are experiencing recession or excess demand. In a recession, tariffs can boost economic activity and employment, albeit at the cost of long-term efficiency. But when an economy is operating at or near its maximum capacity, tariffs will merely raise prices and add to the upward pressure on US interest rates. This clearly applies to the US economy today.

...[U]nless US businesses are sure the tariffs will continue for many years, they will neither invest nor hire new workers to compete with China.

Assuming that well-informed Chinese businesses know this, they will not cut their export prices to absorb the cost of US tariffs. That will leave US importers to pay the tariffs and pass on the cost to US consumers (further fueling inflation) or to US shareholders through lower profits. Thus, the tariffs will not be "punitive" for China, as Trump seems to believe. Instead, the main effect will be to hurt US consumers and businesses, just like an increase in sales tax.

(Anatole Kaletsky, ^œ[The US Will Lose Its Trade War with China](#), *Project Syndicate*, September 21, 2018)

As any fan of magic spirits that live in lamps or bottles knows, releasing them is far simpler than attempting to stuff them back in again! We now live in a hyperglobalized capitalist world (and, assuming neither Russia nor China implodes, we may well find ourselves in a new multipolar one as well) and it is going to take a lot more than "Trade wars [that] are ^œ[good, and easy to win](#)" to reverse 'decades of cynical politics on the part of corporate America'.

And, continuing his program of 'Making America Great Again', Donald Trump, in February, 2025, as Associated Press explained, put tariffs on Canada, Mexico and China, spurring trade wars as North American allies responded. Josh Boak *et al* explained:

WASHINGTON (AP) - President Donald Trump on Saturday signed an order to impose stiff tariffs on imports from Mexico, Canada and China, drawing swift retaliation and an undeniable sense of betrayal from the country's North American neighbors as a trade war erupted among the longtime allies.

The Republican president posted on social media that the tariffs were necessary "to protect Americans," pressing the three nations to do more to curb the manufacture and export of illicit fentanyl and for Canada and Mexico to reduce illegal immigration into the U.S.

The tariffs, if sustained, could cause inflation to significantly worsen, threatening the trust that many voters placed in Trump to lower the prices of groceries, gasoline, housing, autos and other goods as he promised. They also risked throwing the global economy and Trump's political mandate into turmoil just two weeks into his second term. (Josh Boak, Zeke Miller, Rob Gillies and Christopher Sherman, ["Trump puts tariffs on Canada, Mexico and China, spurring trade war as North American allies respond," APNews, February 2, 2025](#))

Of course, these consequences have not been limited to the United States. Throughout the Western World, since the mid-1970s, uncritical belief in and commitment to promoting deregulated 'globalization' and 'off-shoring' have produced similar consequences.

The United States is sacrificing vassal states enroute to Irrelevance It's All About 'Good Business' 🇺🇸

 (21/02/23) (28/02/23) (03/03/23) (14/04/23) (22/04/23) (24/04/23) (30/04/23) (04/05/23)
(30/09/23) (26/11/23)

With the [possibility of newly emerging multipolar alternatives](#) to Western centers of economic power, 2022 might well be seen in history as the year in which Western hegemony began its journey into irrelevance as power shifted to the Eurasian world.⁵⁵¹

Michael Hudson, in a May 2022 interview on the Russian television *RT* (heavily censored for Western audiences by those who are controlling Western information sources), summed up Western Europe's descent into irrelevance:

Peter Scott (PS), *RT* anchor, interviewing Michael Hudson (MH)

PS: Where do you think the EU's standing will be in relation to powerhouses such as China?

MH: Well, it's obviously out of the game. Instead of putting its own interests first, it's really putting the US interests first. It's acting more like a satellite of the United States [than] trying to [pursue] its own destiny.

The whole plan of the EU 20 years ago was to get rich by investing in Russia, investing in China and a mutual exchange. And now it's decided to stop that. The US has absorbed Europe.

The war in Ukraine is a war by the US primarily to pull Europe into the US orbit, prevent European transactions with Russia or China. So Western Europe is being left out, while Russia, China and Eurasia are going with the rest of Asia.

Europe is simply going to be left behind. It's losing its export markets, it's being squeezed and -as you just mentioned- it's pushed up the

retirement age because it's spending its budget on replenishing American military arms instead of investing in industry as it had been doing since 1945

(^œ[Michael Hudson on the Ongoing Economic War, Naked Capitalism](#),
Posted on May 20, 2022 by Yves Smith (Originally published at RT))

The United States, in increasingly unconscionable attempts to hold back the tide of change, has lost the plot.

It recklessly jeopardized the prosperity and security of its major allies: the Western European nations which have shown a remarkable willingness to bear seemingly insurmountable costs in securing what the United States sees as its 'interests'.

And, it has recklessly ^œ[played Pandora](#) to the 21st century world.

Globalization, in the 21st Century relies on a vast network of communication cables and energy pipelines spanning the globe. Any threat to the security of those networks has the potential to paralyze international communication and commerce. The unintended consequences of such behavior for the perpetrator have been assumed to be so devastating that no nation would indulge in such behavior.

But, on September 30, 2022, major leaks suddenly erupted in the Nord Stream gas pipelines that run from Russia to Europe under the Baltic Sea, providing low cost gas to Europe.

Though denied by the United States, credible research and consensus opinion around the world have concluded that the pipelines were sabotaged by the United States which has strongly opposed European use of Russian gas supplies (arguing that expensive fracking sourced gas from the US should be imported to Europe). Zachary Snowdon Smith explained:

If Russian troops enter Ukraine, the United States will "bring an end to" Nord Stream 2, the \$11 billion underwater natural gas pipeline connecting Russia to Germany, President Joe Biden announced Monday, shortly after U.S. officials warned Russia has amassed 70% of the military presence it needs to launch a full-scale invasion of Ukraine. (Zachary Snowdon Smith, ^œ[Biden Vows Nord Stream 2 Pipeline Will Be Canceled If Russia Invades Ukraine](#), *Forbes*, February 7, 2022)

The sabotage of the pipelines was widely denounced as a state-terrorist act of war and Russian officials were quick to point out that The United States had all-but admitted to involvement and that it was an unprecedented attack on major civilian infrastructure⁵⁵².

As [Kaplan suggests](#), "misbegotten wars, when serving as culmination points of more general national decline, can be fatal".

The United States and its allies, while claiming that they are not *involved* in the Ukraine confrontation with Russia, admit that they are, 'supporting' it because, as [Timothy Snyder argued](#),

Russia, an aging tyranny, seeks to destroy Ukraine, a defiant democracy. A Ukrainian victory would confirm the principle of self-rule, allow the integration of Europe to proceed, and empower people of goodwill to return reinvigorated to other global challenges. A Russian victory, by contrast, would extend genocidal policies in Ukraine, subordinate Europeans, and render any vision of a geopolitical European Union obsolete.

As the United States and, in past centuries, Spain, Portugal, Great Britain, France, Holland and other European colonialist powers have demonstrated over the past half-millennium: when promoting war, it's best to invent one's own justificatory 'reality'. The actual 'facts on the ground' and understandings of those being defined as 'the enemy' are irrelevant.

No need to address them even in order to dismiss them. Just present a narrative which 'makes sense' to the intended audience: those who will have to bear the costs of 'going to war'.

Before diving down their rabbit hole into the Alice-in-Wonderland description of "Russian President Vladimir Putin's war in Ukraine" presented below, we need to [refresh our memory of the Russian perspective](#). Then, with that understanding in mind, ask what is missing in the narrative supplied by Fix and Kimmage (the magic of those Wonderland mushrooms is strong in the realm envisioned by our intrepid authors):

Russian President Vladimir Putin's war in Ukraine was meant to be his crowning achievement, a demonstration of how far Russia had come since the collapse of the Soviet empire in 1991. Annexing Ukraine was supposed to be a first step in reconstructing a Russian empire. Putin intended to expose the United States as a paper tiger outside Western Europe and to demonstrate that Russia, along with China, was destined for a leadership role in a new, multipolar international order.

It hasn't turned out that way. Kyiv held strong, and the Ukrainian military has been transformed into a juggernaut, thanks in part to a close partnership with the United States and Western allies. The Russian military, in contrast, has demonstrated poor strategic thinking and organization. The political system behind it has proved unable to learn from its mistakes. With little prospect of dictating Putin's actions, the West will have to prepare for the next stage of Russia's disastrous war of choice.

War is inherently unpredictable. Indeed, the course of the conflict has served to invalidate widespread early prognostications that Ukraine would quickly fall; a reversal of fortunes is impossible to discount. It nevertheless appears that Russia is headed for defeat. Less certain is what form this defeat will take. Three basic scenarios exist, and each one would have different ramifications for policymakers in the West and Ukraine.

(Liana Fix and Michael Kimmage, [Putin's Last Stand: The Promise and Peril of Russian Defeat](#), *Foreign Affairs*, January/February 2023)

Apparently, for Western propagandists, the [2014 Kyiv coup](#) never happened and [The Minsk Agreements of 2014 and 2015](#) were never signed. For them, it was 'Russia's 2014 invasion' which began it all because, apparently, Russia has always been intent on subjugating its neighbor as part of some 'grand design' for conquering Western Europe and establishing a glorious Russian Empire stretching from Vladivostok to Paris ⁵⁵³.

In 2023 Western 'expert' propagandizing of reality has been unrelenting, based, surely, on the assumption that, as Goebbels explained, constant repetition of false narratives works! With strict censorship of all alternative narratives, audiences inevitably become convinced of the only 'reality' they are fed.

And, of course, if Russia is determinedly expanding its empire, so too must the Europeans. The European Union must fulfil its destiny. It is time for

individual member states of the European Union to surrender the last vestiges of national sovereignty to the European Union College of Commissioners, empowering it and its 'president' to act as the leaders of a new, empowered Empire of Europe.

Timothy Garton Ash explains what is 'necessary':

History loves unintended consequences. The latest example is particularly ironic: Russian President Vladimir Putin's attempt to restore the Russian empire by recolonizing Ukraine has opened the door to a postimperial Europe. A Europe, that is, that no longer has any empires dominated by a single people or nation, either on land or across the seas- a situation the continent has never seen before.

Paradoxically, however, to secure this postimperial future and stand up to Russian aggression, the EU must itself take on some of the characteristics of an empire. It must have a sufficient degree of unity, central authority, and effective decision-making to defend the shared interests and values of Europeans. If every single member state has a veto over vital decisions, the union will falter, internally and externally....

... If one of the defining features of empire is supranational authority, law, and power, then the EU already has some important characteristics of empire. Indeed, in many policy areas, European law takes precedence over national law, which is what so infuriates British Euroskeptics. On trade, the EU negotiates on behalf of all member states. The legal scholar Anu Bradford has documented the global reach of the EU's "unilateral regulatory power" on everything from product standards, data privacy, and online hate speech to consumer health and safety and environmental protection. Her book is revealingly, if a touch hyperbolically, subtitled *How the European Union Rules the World*.

Moreover, the longest-running empire in European history, the Holy Roman Empire, was itself an example of a complex, multilevel system of governance, with no single nation or state as hegemon. The comparison with the Holy Roman Empire was made already in 2006 by the political scientist Jan Zielonka, who explored a "neo-medieval paradigm" to describe the enlarged EU..

Support for thinking about the EU in this way comes from an especially pertinent source. Dmytro Kuleba, Ukraine's foreign minister, has described the European Union as "the first ever attempt to build a liberal empire," contrasting it with Putin's attempt to restore Russia's colonial empire by military conquest. When he and I spoke in the heavily sandbagged Ukrainian Foreign Ministry in Kyiv in February, he explained that a liberal empire's key characteristic is keeping together very different nations and ethnic groups "not by force but by the rule of law." Seen from Kyiv, a liberal, democratic empire is needed to defeat an illiberal, antidemocratic one....

(Timothy Garton Ash, [∞][Postimperial Empire: How the War in Ukraine Is Transforming Europe](#), *Foreign Affairs*, April 18, 2023)

An Object Lesson for US Vassal States!

Ukraine: Sacrificed on the altar of US 'Indispensability' 🇺🇸

 (24/04/23) (13/05/23) (27/05/23) (29/05/23) (06/06/23) (08/06/23) (20/06/23) (24/06/23) (02/07/23) (08/07/23) (31/07/23) (18/09/23) (13/10/23) (22/10/23) (06/11/23) (16/11/23) (24/12/23) (17/04/24) (18/09/24) (01/11/24) (05/11/24) (26/12/24)

The root of evil lies...in the spider that is trying to entangle
the entire planet and the whole world in its web
(Vladimir Putin, ^œ[Meeting with... the Security Council](#), Oct 30, 2023)

"...The word will go out to the nations of the world that
It may be dangerous to be America's enemy, but
to be America's friend is fatal."

(Kissinger's prescient warning to Nixon on US' South Vietnam policy, 1968)

As 2024 loomed on the horizon, The Western Alliance had been exposed for what it always has been. Over centuries, Western nations have both believed in and proclaimed to the rest of the world [the wonderful advantages](#) of 'mental culture, power of production, security, and prosperity' which would be their inheritance if they accepted Western dominion.

After all, it was obvious that 'the civilization of the human race' is 'only conceivable and possible by means of the civilization and development of their nations through accepting the West's hegemony.

Nir Hasson, in an essay entitled '^œ[A Massive Database of Evidence, Compiled by a Historian, Documents Israel's War Crimes in Gaza](#)' (*Haaretz*, December 5, 2024) provides a sickening glimpse into the horror world created by The West's last settler colony:

Footnote No. 379 of the carefully researched, wide-ranging document that historian Lee Mordechai has drawn up contains a link to a video clip. The footage shows a large dog gnawing something amid bushes. "Wai, wai, he took the terrorist, the terrorist is gone - gone in both senses," says the soldier who filmed the dog eating a corpse. After a few seconds the soldier raises the camera and adds, "But what a gorgeous view, a gorgeous sunset. A red sun is setting over the Gaza Strip." Definitely a beautiful sunset.

[Israel has carelessly and callously shown the world](#) what has been so successfully obscured by Western propaganda. And, in doing so, it has, once again, reminded the world of their own colonial histories. This cannot be undone!

It will, in future, be much more difficult to maneuver vassal states into sacrificing themselves to Western ambitions. The '[Jungle](#)' has been made aware of the sociopathic, parasitic nature of subordination to those 'Gardens' of The West.

Western promises of enduring support for vassal states as they maneuver them into confrontation with targeted 'threats' have over many decades been short-handed as

We will be with you **for as long as it takes,**

reassuring those vassals that the United States with its allies will support them unconditionally in pursuing those confrontations.

Ali Harb, in a report for *Aljazeera* subtitled 'Support for Kyiv serves the US's 'strategic interests' against security threats posed by Putin's Russia, analysts say', explained:

The words "as long as it takes" have become a rallying cry for American officials as they support Ukraine's fight against the Russian invasion, signalling an open-ended commitment to help Kyiv.

US President Joe Biden put it bluntly on Tuesday when he said in a speech that the United States and its allies will "not tire" of backing

Ukraine - a message seemingly directed at his Russian counterpart Vladimir Putin.

(Ali Harb, ^œ'As long as it takes': US aid to Ukraine sustainable, experts say, *Aljazeera*, February 23, 2023)

With [Boris Johnson's 2022 words](#) no doubt ringing in his ears, Zelensky described the parlous state of Ukraine's 2024 armed forces and their necessary armaments and equipment. A *Reuters* report explained:

Ukrainian troops are suffering high losses because Western arms are arriving too slowly to equip the armed forces properly, President Volodymyr Zelensky told CNN in an interview aired on Sunday.

Russia has been gaining ground in parts of eastern Ukraine including around Pokrovsk. Capture of the transport hub could enable Moscow to open new lines of attack.

Zelensky said the situation in the east was "very tough", adding that half of Ukraine's brigades there were not equipped.

"So you lose a lot of people. You lose people because they are not in armed vehicles ... they don't have artillery, they don't have artillery rounds," said Zelensky, speaking in English. CNN said the interview had been conducted on Friday.

Zelensky said weapons aid packages promised by the United States and European nations were arriving very slowly.

"We need 14 brigades to be ready. Until now ... from these packages we didn't equip even four," he said.

Zelensky will also reiterate to Biden demands for Ukraine to be allowed to use US long-range weapons to strike military targets deep into Russia.

Kyiv needs this permission because Russian jets blasting infrastructure had begun operating up to 500 km (310 miles) from the front lines compared with 150 km earlier, he told CNN.

(^œ[Ukraine suffering high losses due to slow arms supplies, says Zelensky](#), *Reuters*, 15 September 2024)

For the United States and its Western Allies, such assurances are always 'negotiable'! Things change. What was possible when the promises were made presumed the conditions of the time. New conditions require reworked assurances and, of course, what can realistically be done must be modified to account for new commitments.

But, of course, in October 2024, the increasingly inescapable reality of Russia's victory over the West's much ballyhooed proxy had nothing to do with Western strategies and plans. Ukraine, with Western support, had exposed Russia's weakness. It would, inevitably, have collapsed but for the appearance of North Korean troops confronting the otherwise triumphant Ukrainian armed forces.

So, Ukraine's imminent collapse is not due to any failure by 'The West', nor any failure from those valiant Ukrainian forces. Who could have predicted that, just as it seemed that Russia was facing defeat, North Korea would intervene.

Eight thousand North Koreans confronted Ukraine's valiant forces in the Russian territory of Kursk and a further two thousand materialized on the Russian front lines in Donetsk. 10,000 North Korean super warriors had overwhelmed the valiant Ukrainians (the hundreds of thousands of Russian

armed forces personnel have apparently been eclipsed by those North Korean [Übermenschen](#)).

Tara Copp, Matthew Lee and Edith Lederer, writing for *APNews*, explained:

WASHINGTON (AP) '- Some 8,000 North Korean soldiers are now in Russia near Ukraine's border and are preparing to help the Kremlin fight against Ukrainian troops in the coming days, the Biden administration said Thursday.

The new figure is a dramatic increase from a day earlier, when Defense Secretary Lloyd Austin would only say some of the troops had moved toward Ukraine's border in the Kursk region, where Moscow's forces have struggled to push back a Ukrainian incursion.

That also would mean most of the North Korean troops that the U.S. and its allies say have been sent to Russia are now on the border with Ukraine.

The U.S. has estimated a total of about 10,000 North Korean troops are in Russia. Seoul and its allies assessed that has increased to 11,000, while Ukraine has put the figure higher, at up to 12,000.

Of the 8,000 in Kursk, 'we've not yet seen these troops deploy into combat against Ukrainian forces but we would expect that to happen in the coming days,' Secretary of State Antony Blinken said at a news conference in Washington with Austin and their South Korean counterparts.

Russia has been training North Korean soldiers in artillery, drones and 'basic infantry operations, including trench clearing, indicating that they fully intend to use these forces in front line operations,' Blinken said.

North Korea's efforts to tighten its relationship with Russia has raised concerns around the world about how that may expand the war in Ukraine and what Russian military aid will be delivered in exchange.

It's become a key topic as U.S. and South Korean leaders met this week in Washington, fueling concerns that the presence of those soldiers will further destabilize the Asia-Pacific region and broaden Moscow's war on Ukraine.

South Korean Foreign Minister Cho Tae-yul condemned the deployment 'in the strongest possible terms' and called for an immediate withdrawal of the troops. North Korea's belligerent actions not only places the European continent but also the Korean Peninsula under threat and that Seoul agrees 'to take necessary measures accordingly,' he said.

Austin reiterated that Moscow has provided the North Korean troops with Russian uniforms and equipment, another indication they are likely to be used on the front lines.

'Make no mistake, if these North Korean troops engage in combat or combat support operations against Ukraine, they would make themselves legitimate military targets,' Austin said.

However, he said the injection of North Korean troops was unlikely to cause Ukraine to lose ground in Kursk: 'This 10,000 won't come close to replacing the numbers that the Russians have lost' in the fighting to date.

The U.S. estimates that more than 500,000 Russian forces have been killed or wounded in the more than two-year-long conflict..., (Tara Copp, Matthew Lee and Edith Ledere, ^œ[About 8,000 North Korean troops at Ukraine's border are expected in combat in days, US says](#), *Associated Press*, November 1, 2024)

I leave it to the intrepid reader to do the homework! All I can say is, *bollocks!*. Ukraine's collapse and Russia's successful conclusion to its *Special Military Operation* were always inevitable and made inescapable by the embarrassing ineptitude of NATO's conduct.

The West should have known that their promise of unconditional support to Ukraine would end in disaster!

But, for Ukraine, as any vassal should know, colonies trump vassals! The West, reluctantly, must reorder its priorities! As White House spokesperson John Kirby explained on October 12, 2023,

In the near term, we've got appropriations and authorities... for Ukraine and for Israel, but you don't wanna be trying to bake in long-term support when you're at the end of the rope. (Tyler Durden, ^œ[Kirby Bluntly Says Ukraine Aid "Near End Of The Rope" & Won't Be "Indefinite"](#), *ZeroHedge*, Friday, October 13, 2023)

Reasonably, 'as long as it takes' must have an 'end' and, for Ukraine, that end is fast approaching!⁵⁵⁴

So, as we explore the way in which Ukraine was maneuvered into confronting an impossible foe, we need to bear in mind that, as Ukraine has learned, vassal states are expendable!

Bhadrakumar has summarized Russia's understanding of Western intentions and activities leading to Ukraine's 'strategic defeat on the battlefield' and [Israel's Gazan genocide](#):

In remarks at a recent meeting on November 3,... President Vladimir Putin repeated once again that Russia is "defending our moral values, our history, our culture, our language, including by helping our brothers and sisters in Donbass and Novorossiia to do the same. This is the key to today's events."...

...[A]t a recent meeting on security, Putin compared the US to a spider: "It is necessary to know and understand where the root of evil is, that spider who is attempting to wrap the entire planet, the entire world, into its web and wishing to achieve our strategic defeat on the battlefield....

"Fighting precisely this enemy within the framework of the special military operation, we are yet again boosting the positions of all those who are battling for their independence and sovereignty... The truth is that the more Russia is growing stronger and our society is becoming more unified, the more effectively we will be able to stand both for our own national interests and the interests of those nations that fell victim to the West's neocolonial policy."

(M. K. Bhadrakumar, ^œ[Don't plan yet for Ukraine reconstruction](#), *Indian Punchline*, November 15, 2023)

In the face of unrelenting Western propaganda attempting to redefine Russia's intentions⁵⁵⁵, Russia **is not** and has never suggested that it was, attempting to 'subjugate its neighbor'. It had every intention, if that was possible, of ensuring that ^œ[Ukraine would remain an independent](#),

sovereign, functioning democracy, holding on to roughly 85 percent (i.e. less Crimea⁵⁵⁶) of the territory it controlled before Russia's 2022 invasion.

Russia's 24 February 2022 'invasion' of the Donbass was always about ensuring the safety of the Russian speaking Donetsk and Lugansk People's Republics, Kherson and Zaporozhye regions, and, if necessary, their admission into the Russian Federation.

After all, what sane, reasonably intelligent Russian administration would want to re-admit an ^œalways rebellious, ideologically suspect region into an emerging successfully functioning Russian Federation, recovering from the ^œWestern predations of the 1990s?

As the *Russian News agency Tass* reported on ^œFebruary 27, 2022,

Russian President Vladimir Putin said in a televised address on Thursday morning that in response to a request by the heads of the Donbass republics he had made a decision to carry out a special military operation in order to protect people "who have been suffering from abuse and genocide by the Kiev regime for eight years." The Russian leader stressed that Moscow had no plans of occupying Ukrainian territories.

When clarifying the unfolding developments, the Russian Defense Ministry reassured that Russian troops are not targeting Ukrainian cities, but are limited to surgically striking and incapacitating Ukrainian military infrastructure. There are no threats whatsoever to the civilian population.

At the start of October 2022 the objectives of Russia's '[Special Military Operation](#)' appeared to have been attained. The next moves in what from the outset was a proxy war between Russia and the combined 'West' were now up to the United States and its allies.

On October 3, 2022, with Ukraine and its Western 'allies' refusing to negotiate the security of the Russian speaking regions⁵⁵⁷, the Russian Federation Council approved the agreements on the admission of Donetsk and Lugansk People's Republics and Kherson and Zaporozhye Regions into Russia:

The State Duma ratified the treaties on the admission of the Donetsk and Lugansk People's Republics, Kherson and Zaporozhye regions into the Russian Federation, the decision was made unanimously. Now in the Russian Federation there are 89 subjects, said the speaker of the lower house of parliament Vyacheslav Volodin. In turn, Foreign Minister Sergei Lavrov pointed out that the process of joining the four regions "became a logical continuation of the reunification of Russian lands," which began with the return of Crimea and Sevastopol in 2014. Draft federal constitutional laws on the inclusion of these regions were also adopted and coordinating deputies were appointed in the DPR, LPR, Zaporozhye and Kherson regions.

(^œ"Unanimously": [the State Duma ratified the laws on the admission of the DPR, LPR, Zaporozhye and Kherson regions into Russia](#), *Teller Report*, October 4, 2022)

Ukraine's disputed territories are now included within the Russian Federation and any future belligerence toward those regions is, from now on, 'attacking Russia'.

In light of the admission by Western European negotiators that the [Minsk agreements had been a ruse](#), Special Military Operation activities would continue for as long as necessary to gain and guarantee full control of the annexed territories and ensure their safety from further attack.

Russian Foreign Minister Sergey Lavrov explained why this was necessary:

Everybody knows that Zelensky is in no way an independent figure. He is being told what to do, which policy to pursue. Of course, he is improvising while pursuing this course, depending on the situation on this concrete day. But it is senseless to speak with him...

(^œ[Senseless to speak with Zelensky, says Lavrov: Everybody knows that Ukrainian President is in no way an independent figure, Russian Foreign Minister said, TASS, July 01, 2023](#))

As a TASS news report explained, there seemed, at the end of June 2023, little hope that, despite horrendous numbers of Ukrainian lives lost and mounting casualties, the United States and its vassals would agree to engage in meaningful peace talks.⁵⁵⁸

With the US and its 'allies' demanding Russia's defeat as a precondition of 'peace talks' the onus for ending hostilities was, nonetheless, now on the Ukrainian Government and its Western sponsors.⁵⁵⁹

In the period following Russia's annexation of the four eastern Russian speaking regions of Ukraine on October 3, 2022, Russia's ambitions in Ukraine appeared to have been fulfilled. All that remained was for it to secure the territories of the annexed regions. With that completed, for Russia, the 'Special Military Operation' would be completed.

From that time on its primary aim in continuing the conflict was not to 'conquer Ukraine' but to secure those territories. It set about doing so by massively fortifying its frontlines from Ukrainian attack and waiting for Ukraine to accept the inevitability of a newly expanded Russian Federation on its new eastern border.

The 'war in Ukraine' has, since that time, been wave after wave of Ukrainian attacks against the more than 1000 km, heavily fortified, Russian frontlines with Russian forces suffering minimal losses in equipment and personnel.

Ukrainian forces however have had to attack across carefully prepared, kilometers' wide approaches to those frontlines. In doing so Ukraine has suffered horrendous personnel losses and escalating numbers of attack vehicles and quantities of weaponry destroyed or abandoned in those well-prepared approaches.

Ukrainian President Vladimir Zelensky, in a statement (^œ[July 02 2023](#)) condemning his forces to prolonged horrific and futile attempts at breaching Russian defenses, undoubtedly echoing Washington dictates, explained the preconditions for any negotiations with Russia:

[W]e emphasize once again: Ukraine will be ready for some format of diplomacy when we are really on our borders, on our real borders according to international law.

Apparently the horrendous loss of lives and the consequences for Ukrainian forces as they attempted yet another US demanded 'counter-offensive' were irrelevant:⁵⁶⁰

Bhadrakumar, at the start of March 2023, depressingly (realistically) explained the Western response:

Today, it is an incontrovertible fact that the US and NATO are directly involved in the conflict. More importantly, Russia has gained the upper hand militarily and Ukraine stares at defeat despite all the weaponry pumped into that country by the US and its allies.

The US is forcing Russia to reduce Ukraine to a rump state. To be sure, once that happens, the US will walk away, as it did in Afghanistan - and may be in all probability, the Biden team will be heading for the Indo-Pacific for new adventures. The war has been highly profitable for the US military-industrial complex.

Second, the revelations by former German Chancellor Angela Merkel and French President Francois Hollande, amongst others, that the so-called Minsk Agreements were nothing more than an elaborate charade to hoodwink Moscow and buy time for NATO to militarise Ukraine and prepare that country to fight Russia in a conceivable future, has exposed the chicanery of the US. Washington never wanted Kiev to negotiate with Russia or have discussions with the separatist groups in Donbass regarding regional autonomy within a federated Ukraine. This is the honest historical truth.

Put differently, Russia was left with no option but to act pre-emptively to safeguard its interests just as Kiev with backing from NATO and the US was all set to launch a major offensive against the ethnic Russian population in Donbass for a 'final solution.'

Third, the findings by the renowned American journalist Seymour Hersh that none other than President Biden had ordered the sabotage of the Nord Stream gas pipelines - the decision was taken even months before the Russian special military operations began in February 2022 - are a damning indictment of the US for orchestrating the complete rupture of German-Russian energy cooperation, which again throws light on Washington's diabolical agenda to exploit the Ukraine situation to strengthen its transatlantic leadership.

(M. K. Bhadrakumar, ^œ[A reality check for Modi Govt's G20 ambitions](#), *Indian Punchline*, March 02, 2023)

The size of that 'rump state' of Ukraine will be determined by the reality of a NATO threat to the newly expanded Russian Federation. Supply of weaponry with a 250km (155 miles) range will result in an effective demilitarized zone between the Russian Federation and that 'Rump State' which will ensure that Russian territory is not threatened by those weapons.

If nothing else, the United States is consistent! When it finds itself in a 'no-win' situation, it does what it has become so used to doing in its post-WW2 failed 'regime change' adventures: it cuts and runs, leaving its proxies to whatever fate awaits them in their most desperate hour of need.

US President Biden once again demonstrated that wonderful concern the United States has always shown for those vassal states whom it has used, abused and discarded:

President Joe Biden on Saturday said his administration would not "make it easy" for Ukraine to join NATO, adding that the war-torn nation must meet the same standards as other member states.

Asked in a gaggle in Philadelphia about easing Ukraine's path to joining the transatlantic alliance - likely in reference to the Membership Action Plan, a key obstacle in Ukraine's efforts - Biden said: "No. Because they've got to meet the same standards. So we're not going to make it

easy."

(Giselle Ruhiyyih Ewing, ^œ[Biden: We won't 'make it easy' for Ukraine to join NATO](#), *Politico*, June 17, 2023)

One can but speculate on the inducements used to convince the Ukrainian leadership to renounce a peace treaty they had begun to seriously negotiate in early March 2022. As [Russia's Security Council Secretary Nikolay Patrushev](#) explained:

The Ukrainian leadership was ready to settle the conflict with Russia but gave up under the US pressure, Russia's Security Council Secretary Nikolay Patrushev said on Thursday.

"Had it not been for the US pressure on those whom they installed at the head of Ukraine, this situation would have not happened, Even the Ukrainian leaders themselves were ready for signing a peace treaty and gave Russia written proposals that we, in principle, approved," Patrushev said, obviously referring to the negotiations between the Russian and Ukrainian delegations in Turkey in March last year.

However, as Patrushev went on to say, "in the morning, they [members of the Ukrainian delegation] gave [the proposals] to us during the negotiations and in the evening they said: 'No, we give them up.'"

"This happened only because the United States had put pressure on them and said that no negotiations must be held," the secretary of Russia's Security Council stressed.

On April 16, 2024 the unofficial 'Foreign Affairs' voice of the United States Administration and Congress published an article entitled 'The Talks That Could Have Ended the War in Ukraine: A Hidden History of Diplomacy That Came Up Short - but Holds Lessons for Future Negotiations'.

Its authors, Samuel Charap and Sergey Radchenko, provided a Western version of the reasons for the failure of the March=April 2022 negotiations between Russia and Ukraine (some of these (e.g. 'the discovery of ^œ[Russian atrocities at Irpin and Bucha](#)') need to be treated with skepticism/caution!). As they conclude:

...Even if Russia and Ukraine had overcome their disagreements, the framework they negotiated in Istanbul would have required buy-in from the United States and its allies. And those Western powers would have needed to take a political risk by engaging in negotiations with Russia and Ukraine and to put their credibility on the line by guaranteeing Ukraine's security. At the time, and in the intervening two years, the willingness either to undertake high-stakes diplomacy or to truly commit to come to Ukraine's defense in the future has been notably absent in Washington and European capitals....

(Samuel Charap and Sergey Radchenko, ^œ[The Talks That Could Have Ended the War in Ukraine: A Hidden History of Diplomacy That Came Up Short - but Holds Lessons for Future Negotiations](#), *Foreign Affairs*, April 16, 2024)

With Ukraine, since that time, suffering horrendous losses of personnel and equipment and its military 'counter-offensive' in disarray, it found that the United States had decided to leave it to its fate.

In September, 2023, the Ukrainian leadership found itself left to negotiate its future alone. But a lot of water had passed under that bridge in the nineteen months following its aborted March 2022 negotiations.

In November 2023 The United States and its Western allies decided that their commitments to their Middle East military stronghold (Israel) eclipsed their guarantees to Ukraine.

Ukraine was merely a means to an end which had proved unattainable. Israel, on the other hand, was a long-term investment into Western dominance in the oil-rich regions of the Middle East.

It was time to cut and run from Ukraine and concentrate its resources and energies on maintaining control of its [Middle East land-based aircraft carrier](#).

Despite continued public assurances to Ukraine that it would be with them 'for as long as it takes', Ukraine was being informed that it was time for them to negotiate a conclusion to the conflict.

But, of course, November 2023 was 20 months too late!

By then, Ukraine had ^œ[sacrificed between 400 and 500 thousand](#) of its armed forces and lost most of its military and other supporting infrastructure in a futile attempt to 'defeat' a peer competitor to the United States.

It was always an absurd venture, dreamed up by Western neo-conservatives gambling the very existence of Ukraine and the lives of its people, in the hope of a large pay off for the United States, but with the almost certain demolition of its proxy.

In March 2022 Russia and Ukraine had begun to negotiate acceptable terms (including security guarantees for both sides). As they closed in on the first round of negotiations, which would have put an end to the West's plans for weakening Russia enroute to dismantling the Russian Federation and securing and privatizing its developing resources, the West intervened.

Boris Johnson, acting as an emissary for Western Interests, visited Kyiv.

David Arakhamia, chief Ukrainian negotiator, on November 24, 2023, explained what happened:

When we returned from Istanbul, Boris Johnson came to Kiev and said that we would not sign anything with [the Russians] at all. And [said] 'let's just continue fighting.'

(^œ[Boris Johnson derailed Ukraine peace deal - key Zelensky ally, The Intel Drop](#), November 25, 2023)

As Russian Television channel *RT* reported:

Russia was ready to stop the fighting had Ukraine agreed to remain neutral, but the West advised Kiev to keep going, the head of President Vladimir Zelensky's parliamentary faction - and the chief negotiator at the peace talks in Istanbul - David Arakhamia admitted on Friday.

Arakhamia, who heads the 'Servant of the People' parliamentary group, told the TV channel 1+1 that Moscow had offered Kiev a peace deal in March 2022, but the Ukrainian side did not trust Russia.

"Russia's goal was to put pressure on us so that we would take neutrality. This was the main thing for them: They were ready to end the war if we accepted neutrality, like Finland once did. And we would make a commitment that we will not join NATO. This was the main thing," said Arakhamia.

However, agreeing to neutrality and giving up NATO membership would have required changing the constitution of Ukraine, Arakhamia

explained. "Secondly, there was no trust in the Russians that they would do this. This could only be done with security guarantees," he told 1+1.

During the talks, Arakhamia added, British then-PM Boris Johnson arrived in Kiev and told Ukrainian officials to keep fighting and not sign any agreements with Moscow.

Johnson's role in scuttling the peace talks in Istanbul was revealed in May 2022 by the outlet Ukrayinska Pravda. However, neither the British politician - who was ousted as PM in June that year and eventually landed a job at an American think tank - nor the US government ever officially acknowledged pressuring Kiev into reneging on the draft agreement, which Arakhamia himself had signed with the Russians. Kiev had likewise never officially commented on the matter - until now.

Earlier this year, Russian President Vladimir Putin revealed to African leaders that Moscow and Kiev had signed a draft agreement "on permanent neutrality and security guarantees for Ukraine" at the talks hosted by Türkiye.

As soon as Russia pulled back its troops from the vicinity of Kiev, as a gesture of good will, Ukraine reneged on the deal, Putin said.

The Russian withdrawal was presented by Western governments and media as a Ukrainian military victory and they began sending heavy weapons and equipment to Zelensky's government, fueling the conflict for the next 18 months.

([Ukraine conflict could have ended in Spring 2022 - Kiev's top MP: David Arakhamia led Kiev's delegation in the talks with Moscow, RT, 24 November, 2023](#))

Vassal states should take note!

When the United States says that its support will be unwavering and that it will be with a proxy for 'as long as it takes' what it means is that it will provide support for as long as it sees an advantage in doing so. When it decides that costs outweigh rewards, the US will 'cut and run' leaving the unfortunate proxy to salvage what it can from the debacle.

Bhadrakuma explained:

The ground war in Ukraine has run its course, a new phase is beginning. Even diehard supporters of Ukraine in the western media and think tanks are admitting that a military victory over Russia is impossible and a vacation of the territory under Russian control is way beyond Kiev's capability.

Hence the ingenuity of the Biden Administration to explore Plan B counselling Kiev to be realistic about loss of territory and pragmatically seek dialogue with Moscow. This was the bitter message that US Secretary of State Antony Blinken transmitted to Kiev recently in person.

But President Zelensky's caustic reaction in a subsequent interview with the Economist magazine is revealing. He hit back that the western leaders still talk the good talk, pledging they will stand with Ukraine "as long as it takes" (Biden mantra), but he, Zelensky, has detected a change of mood among some of his partners: "I have this intuition, reading, hearing and seeing their eyes [when they say] 'we'll be always with you.' But I see that he or she is not here, not with us." Certainly, Zelensky is reading the body language right, as in the absence of an

overwhelming military success shortly, western support for Ukraine is time-limited.

(M. K. Bhadrakumar, ^œ['Biden's phase' of Ukraine war is beginning](#), *Indian Punchline*, September 17, 2023)

And, given its track-record, it is reasonable to presume that it will take no responsibility for rebuilding its war-torn victim proxy!

[Uneasy lies the head that wears a Western Proxy's crown.](#) 🇺🇸

 (15/08/24)

It appears that The United States and its allies have little genuine concern for the future of Ukraine. It is an expendable pawn in a geopolitical struggle to ensure US supremacy and 'indispensability' in the 21st century.

One can but wonder how much of the rest of Europe the United States is prepared to compromise in this way. As [Doctorow \(May 25, 2023\)](#) says of the consequences of US' myopic pursuit of its delusional Ukraine-Russia War objectives:

...Very little is being reported about the ^œ[build-up of NATO troop strength and materiel all along the Eastern frontier with Russia](#). Very little is being reported right now in Western media about the threats coming from Poland to support an armed uprising being planned against the Lukashenko government in Belarus....

...[W]hat would the USA do about the destruction of its European allies? An informed guess is nothing. If Washington is now pussy-footing over whose tanks go to Ukraine, over whose F-16s go to Ukraine, all for the purpose of keeping the fight with Russia at the level of proxies, then why would the USA risk instant destruction by Russian strategic missiles just because Europe is burning?

Russian Foreign Minister Sergei ^œ[Lavrov explained \(June 06, 2022\)](#) Russia's responsibility: "The longer the range of the systems that will be delivered, the further we will move back the Nazis from that line from which threats to Russian-speakers and the Russian Federation may come,"

James Gregory, in a BBC News Report, explained the 2023 reaction of the Western alliance to Lavrov's entirely logical (and reasonable) assertion:

The UK has confirmed it is supplying Ukraine with long-range missiles it requested for its fight against invading Russian forces.

The Storm Shadow cruise missile has a range of over 250km (155 miles), according to the manufacturer.

By contrast, the US-supplied Himars missiles used by Ukraine only have a range of around 80 km (50 miles).

The weapons will give Ukraine the "best chance" of defending itself, UK Defence Secretary Ben Wallace said.

They are fired from aircraft, so the longer range means Ukrainian pilots will be able to stay further from the frontlines.

Once launched, the Storm Shadow drops to low altitude to avoid detection by enemy radar, before latching onto its target with an infra-red seeker.

The announcement was made in the House of Commons by Mr Wallace. The decision follows repeated pleas from Ukraine for more weapons from the West.

Mr Wallace said the missiles would "allow Ukraine to push back Russian forces based on Ukrainian sovereign territory".

Mr Wallace wrote to his Russian counterpart Sergei Shoigu in December, he said, to warn that further attacks could result in the UK donating more capable weapons.

He said the missiles were "going into" or already in Ukrainian hands, and described the move as "calibrated and proportionate to Russia's escalations".

"None of this would have been necessary had Russia not invaded," he said.

He said the missiles would be compatible with Ukraine's existing, Soviet-era planes and praised the technicians and scientists who made that possible.

(James Gregory, [UK confirms supply of Storm Shadow long-range missiles in Ukraine](#), *BBC News*, 11 May, 2023)

If Ukraine is to remain a viable sovereign nation-state into the rest of the 21st century, the US and its allies will need to become far more willing (and able) to [engage in mature compromise](#) than they have in recent years.

Belief in the willingness of those involved to maturely negotiate an end to current conflict presumes that those involved are seeking a peaceful, long-term conclusion to it all.

But, if the real purpose of belligerence is ensuring corporate profits, [future-proofing profits](#) will be more important than an exit strategy from the current Ukraine conflict.

Best to leave Russia with a festering problem on its borders (just as early 1950s China and North Korea were left with a stalemate conclusion to the Korean war). As in South Korea, that requires ongoing US commitment to arming and supporting Ukraine to maintain an effective 'demilitarized zone' ensuring continued Russian involvement while ramping up more profitable alternatives elsewhere.

As we have seen, the United States has a long history of interfering in the affairs of other regions in order to ensure the establishment and maintenance of its peculiar version of 'democracy' in those nations. For more than a century it has seen as its [mission the protection of the world from 'socialism' and 'communism'](#).

For it, the 2nd World War never really ended. The forces of fascism might have been defeated but the real threat to 'world peace' had 'always' been not fascism but socialism and communism. And now, with its defeat of Germany, the Soviet Union was poised to 'take over the world'.

This was, of course, delusional.

The people of the Soviet Union had suffered enormous losses during the war with more than 27 million dead and millions more injured and in desperate need of rehabilitation, cities and infrastructures destroyed and new territories ceded to it needing to be integrated into the Union. The last thing it needed or wanted was more war against a belligerent, adolescent 'super-power' determined to 'regime change' it!

As the rest of the world set about the reconstruction of their nations, the United States, unscathed by 'The War', set about preparing for what was to

become its driving ambition through the next century: the conversion of all designated 'dictatorships' and 'autocracies' to 'democracy'.

Carter Malkasian has, in the same justificatory language as those who called US 'allies' to the cause in 1950, described the United States' first 'military challenge' after WW2 ⁵⁶¹:

There is more than a passing similarity between the 1950~ Korean conflict and the 2022~ Russia - Ukraine conflict.

The Korean conflict was a consequence of the United States, in 1945, deciding that it would occupy the southern half of Korea and install a puppet government, the frontline of the coming war against 'communism', preventing the re-establishment of a united Korea under a leadership allied with China.

For the Western military-industrial complex, that decision has been a profitable one (with a long ^œ[list of United States Army installations in South Korea](#)). Those same profit-driven merchants of death are now anticipating a prolonged, festering Russia-Ukraine stalemate ensuring a profitable propping up of Ukraine through coming decades.

Bhadrakumar put it well:

It is quite amazing. Hardly has one flawed narrative - espousing Russia's military defeat in Ukraine and the overthrow of Putin - unravelled, another narrative is being hoisted, predicated on the simplistic notion that Russia will simply roll over and passively watch the US integrating Ukraine into the western alliance system to create an open wound festering on Russia's western borders that will drain resources for decades to come and complicating ties with neighbours. (M. K. Bhadrakumar, ^œ[US hopes to snatch victory from jaws of defeat in Ukraine](#), *Indian Punchline*, May 21, 2023)

In a demonstration of responsible corporate future-planning, Western involvement in Ukraine has already been used to demonstrate, to Western audiences, the need to ensure 'adequate' stockpiles of weaponry for future contingencies.

As Gould and Losey, writing for *Defense News*, explained, future Pentagon budgets must aim 'to max munitions production, make multiyear buys':

The Pentagon aims to rev up the munitions industrial base and max out production lines for several top priority missiles, according to the budget unveiled Monday.

With an eye on Russia and China, the Pentagon in fiscal 2024 would spend \$30.6 billion for missiles and munitions - 12% more than last year and 50% more than five years ago, when the U.S. was still fighting the Islamic State and Taliban....

To replenish U.S. stockpiles depleted by the war in Ukraine, Pentagon officials said they will rely on supplemental appropriations from Congress, which granted the Pentagon \$35.7 billion for FY23.

"These are not the kind of missiles that are key to the Ukraine fight, they are key to Indo-Pacific deterrence," McCord said. "What [Hicks] has been pushing us to do is to think about lessons we're learning today and apply them to future scenarios, think about what would I have done four years ago if I had a crystal ball, to think about things that might be coming."

The Pentagon's \$170 billion procurement budget request - touted as the largest ever - would use a new "large lot procurement pilot" strategy to maximize production capacity for several munitions used across the services: Lockheed Martin's Joint Air-to-Surface Standoff Missile Extended Range (JASSM-ER) and Long-Range Anti-Ship Missile (LRASM) - and the Raytheon Technologies-made RIM-174 Standard Missile (SM-6), AIM-120 Advanced Medium Range Air-to-Air Missile (AAMRAM).

(Joe Gould and Stephen Losey, [Pentagon budget aims to max munitions production, make multiyear buys](#), *Defense News*, March 14, 2023)

For a militarist state, peace is merely prelude to hostilities, a time to be used to prepare for inevitable, increasingly profitable, future confrontations.

Bhadrakumar explained:

The US is forcing Russia to reduce Ukraine to a rump state. To be sure, once that happens, the US will walk away, as it did in Afghanistan - and may be in all probability, the Biden team will be heading for the Indo-Pacific for new adventures. The war has been highly profitable for the US military-industrial complex.

The 'war' in Ukraine was never about Ukraine. It was always about adolescent Western wet-dreams of invading and dismembering the 'Russian Bear'.

And Zelensky's rock-star adulation by Western 'leaders' was never about Zelensky's handling of 'The War'. It was always about his usefulness in furthering the West's ambitions.

The leaders of proxy nations are, by definition, fungible, easily replaced by any one of a number of already groomed and willing alternatives.

The United States, with apparently unquestioning support from its European 'partners'. seems to have decided that Zelensky's usefulness is drawing to an end. As they have, in countries around the world, shown in the past, proxy leadership is fungible, easily replaced when it seems to be losing popular support. There are always viable alternatives more appropriate to the times.

Russian television channel *RT* provided its understanding of what the future Ukraine leadership would look like:

The US is planning to unleash a campaign to discredit Ukraine's Vladimir Zelensky to pave the way for replacing him with a more pliable figure, Russia's Foreign Intelligence Service (SVR) has claimed. The agency believes former Interior Minister Arsen Avakov is being considered to take the helm of Ukraine.

In a statement on Tuesday, the SVR claimed that "the American elite" is growing increasingly frustrated with Zelensky as lawmakers on both sides of the aisle start to "doubt the targeted spending of billions of dollars in military aid to Kiev."

"Zelensky is taking crazy steps that threaten to trigger escalation far beyond Ukraine," officials said, adding that Kiev "has moved to feverish action" as the Ukrainian leader struggles to maintain his grip on power after his presidential term officially ended in May.

([West lining up ex-Poroshenko minister to replace Zelensky - Russian intel](#), *RT*, August 15, 2024)

Uneasy lies the head that wears a proxy crown! Today, adulation. Tomorrow the guillotine!

Conclusion 🐈

★ Rather than creating costs, both regulation and deregulation shift them... Regulation and deregulation each consists of lower costs for one party and higher costs for the other.
(Samuels & Shaffer 1982, p. 467)

★ 'Well! I've often seen a cat without a grin,' thought Alice; 'but a grin without a cat! It's the most curious thing I ever saw in my life!'
(Lewis Carroll *Alice's Adventures in Wonderland*)

The social welfare component of production and financial activity costings is disappearing. Like the Cheshire cat, in many countries around the world we are left with little more than the grin. Economic and financial activity have been globalized and public debt in Western countries has become a major concern:

★ The health care model in Canada is delivered through a publicly-funded system where many go to their doctor's office and show them a health card. But in this day and age of deficits, debt and costs, can Canada still afford this system?

The Canadian federal government's public debt stands at more than \$526.7 billion and maintains a budget deficit of approximately \$57 billion. Most provinces across the country are also attempting to sustain deficits, such as Ontario, which is running a \$22 billion deficit.
([Rising costs, deficits could force Canada to revise health system](#)
Andrew Moran, Toronto Headlines Examiner, June 2nd 2010)

★ Irish Prime Minister Brian Cowen, whose government is close to collapse, unveiled a 15 billion-euro (\$20 billion) four-year austerity plan that immediately drew accusations of overconfidence in assuming the crippled Irish economy can grow.

"The size of the crisis means that no one will be sheltered from the contribution that has to be made toward national recovery," he told a news conference.

The plan includes thousands of public sector job cuts, phased-in increases in Ireland's value-added tax (VAT) rate from 2013 and social welfare savings of 2.8 billion euros by 2014, but does not touch the country's ultra-low corporate tax rate.
([Ireland austerity plan draws skepticism](#), Padraic Halpin and Carmel Crimmins, *Reuters* Dublin, Wed Nov 24, 2010)

★ It is important to bear in mind the definition of unsustainability: it is a circumstance when, regardless of the sovereign's efforts, debt relative to GDP (and therefore debt servicing relative to GDP) will grow indefinitely. In those circumstances, the economic net present value of the sovereign's debt is less than the face value of the debt; moreover, it will likely continue to fall until a restructuring is undertaken and growth resumes.
([Sovereign Debt Restructuring: Messy or Messier?](#) Anne Krueger, January 4, 2003, International Monetary Fund, Washington, D.C.)

★ Greece reached agreement with the International Monetary Fund (IMF), the European Commission, and the European Central Bank (ECB) on a focused program to stabilize its economy, become more competitive, and restore market confidence with the support of a €110 billion (about \$145 billion) financing package....

Greece faces a dual challenge. It has a severe fiscal problem with deficits and public debt that are too high; and it has a competitiveness problem. Both need to be addressed for Greece to be placed on a path of recovery and growth.

First, the government's finances must be sustainable. That requires reducing the fiscal deficit and placing the debt-to-GDP ratio on a downward trajectory. Since wages and social benefits constitute 75 percent of total (non-interest) public spending, public wage and pension bills - which have grown dramatically in recent years - have to be reduced. There is hardly any other room for maneuver in terms of fiscal consolidation.

Second, the economy needs to be more competitive. This means pro-growth policies and reforms to modernize the economy and open up opportunities for all. It also means that costs must be controlled and inflation reduced so that Greece can regain price competitiveness.

([∞][*Europe and IMF Agree €110 Billion Financing Plan With Greece*](#), IMF Survey online, May 02, 2010)

The removal of social costs from production and financial activity costs in Western economies has produced its inevitable consequence. [sovereign debt](#) has grown steadily since the 1970s as governments have gone into deficit to cover those costs. In the past several years, as governments have been required both to provide rescue packages for banking systems and 'stimulate' their economies to avoid or minimize recession, that debt has blown out.

Nations which, prior to 2008, were largely coping with the costs of scaled down versions of earlier public social welfare costs, now find themselves with unsustainable debt. Another crisis similar to that of 2008 would introduce many of them to structural adjustment programs similar to that implemented in Greece ⁵⁶².

Western nations are beginning to understand what 'structural adjustment' really means in a globalized neoliberal world. They just did not take the problems seriously when Third World countries complained about the effects.

Nation-states, once firmly in control of economic activity within their borders are, in a new deregulated, privatized world, decreasingly able to shield their populations from the exploitative consequences of unregulated and internationalized market exchange.

Now, there is no international forum capable of limiting and directing the bargaining advantages of businesses whose holdings and turnover eclipse those of the countries with which they do business. No longer is the economy the means by which communities meet their needs and wants. Now communities service an internationalized economy which need accept no reciprocal responsibilities for their welfare.

In subordinating their interests and populations to the globalized market place, Western peoples have sacrificed the regulatory 'protections' established after the 1929 crash. It will be extraordinarily difficult to re-establish such protections.

We are entering uncertain times. With neoliberalism challenging the independent sovereign rights and responsibilities of both Western and non-Western national governments and the increasingly obvious decline of Western hegemony (based on both colonial and neo-colonial financial and military domination) the informal 'empire' of 'The West' is in possibly terminal decline.

As [Kaplan warned](#):

...the aftershocks of such imperial comeuppance should never be underestimated or celebrated. Empires form out of chaos, and imperial collapse often leaves chaos in its wake...

We are entering the twilight of both Western hegemony and the Western defined democratic nation-state.

There are powerful forces in play, threatening the true sovereignty of nations and possibly the survival of us all and claiming that all this is 'necessary' if we are to remain a 'civilized' species.

Do not go gently into that dark night...
Rage, rage against the dying of the light.

Conglomerates and the Progressive modernization of Poverty

Conclusion

One of the saddest features of the 'Third World Development' drive is that, in the process of reorganizing utilization of their environments, non-Western communities have been disrupted.

Many of them are disintegrating, victims of the well-meaning 'development' activities of Western experts ⁵⁶³.

As S. N. Sangmpam claimed:

- ✴ modernization theory assumes an imaginary society because the real society in the Third World is perceived as 'transient'.
(Sangmpam (1994 p. 1))

The Imaginary 'Development Specialist' World: 🇷🇺

- ★ It is possible to identify all societies, in their economic dimensions, as lying within one of five categories: the traditional society, the preconditions for take-off, the take-off, the drive to maturity, and the age of high mass-consumption.

...Once it was demonstrated that growth was possible, the consequences of growth and modernization, notably its military consequences, unhinged one traditional society after another, pushed it into the treacherous period of preconditions, from which many, but not all the world's societies have now emerged into self-sustained growth...

We can be confident ... that to the degree that consumer sovereignty is respected and real incomes increase we will see similar - but not identical - income-elasticities of demand and, therefore, similar patterns of structural evolution in different societies as they go through the high-consumption phase.

Now, ... consider this question: what lies beyond? What will happen to societies when income provides such good food for virtually all that it raises questions of public health by its very richness; where housing is of an order that people are not tempted to exert themselves much to improve it; where clothing is similarly adequate; where a Lambretta or Volkswagen is within the grasp of virtually all... ?

(^œRostow (1961 pp. 4, 90-1))

The Reality: 🇷🇺

- ★ In 2001, 924 million people, or 31.6 per cent of the world's urban population, lived in slums. The majority of them were in the developing regions, accounting for 43 per cent of the urban population, in contrast to 6 per cent in more developed regions.

Within the developing regions, sub-Saharan Africa had the largest proportion of the urban population resident in slums in 2001 (71.9 per cent) and Oceania had the lowest (24.1 per cent). In between these were South-central Asia (58 per cent), Eastern Asia (36.4 per cent), Western Asia (33.1 per cent), Latin America and the Caribbean (31.9 per cent), Northern Africa (28.2 per cent) and Southeast Asia (28 per cent).

With respect to absolute numbers of slum dwellers, Asia (all of its sub-regions combined) dominated the global picture, having a total of 554 million slum dwellers in 2001 (about 60 per cent of the world's total slum dwellers).

Africa had a total of 187 million slum dwellers (about 20 per cent of the world's total), while Latin America and the Caribbean had 128 million slum dwellers (about 14 per cent of the world's total) and Europe and other developed countries had 54 million slum dwellers (about 6 per cent of the world's total).

... in many cities, there are more poor people outside slum areas than within them. Slum areas have the most visible concentrations of poor people and the worst shelter and environmental conditions, but even the most exclusive and expensive areas will have some low-income people. In some cities, slums are so pervasive that rather than designate residential areas for the poor, it is the rich who segregate themselves behind gated enclaves.

(UN Agency for Human Settlements, ^œ*The Challenge of Slums: Global Report on Human Settlements 2003* p. xxv, xxvi)

Third World Communities *are* Changing - but into What? 🐼

 (10/09/17) (19/02/18)

In this discussion we will examine the experiences of Third World nations as they became "unhinged" and attempted to "emerge into self-sustained growth" (to use Rostow's colourful, optimistic phraseology); as they attempted to 'develop' into capitalist success stories over the past 80 years. We will briefly contextualize that examination by looking at pre-Western forms of environmental organization and understanding.

The West has, over the past five hundred years, viewed such understandings as irrelevant; relics of prehistory; eclipsed by "the world of contemporary technology" and the rational understandings it has unveiled to the world. W. W. Rostow, that doyen of economic development specialists⁵⁶⁴, explained it:

A ... challenge which clearly relates to the stages of growth is the fate of societies that appear still trapped in the preconditions for take-off. They are not traditional societies, because the world of contemporary technology is so powerful and intrusive that it has introduced elements of modernity in all nations. Nevertheless, perhaps 20% of the human race [⁵⁶⁵] - a billion or so men women and children - lives in countries that have not yet attained self-sustained growth...

The second stage of growth embraces societies in the process of transition; that is, the period when the preconditions for take-off are developed; for it takes time to transform a traditional society in the ways necessary for it to exploit the fruits of modern science, to fend off diminishing returns, and thus to enjoy the blessings and choices opened up by the march of compound interest.

(^œ1961 pp. xxii, 6)

It is indeed true of [Western ideologues](#), convinced in their dogmas, that,

...even high intelligence is no vaccine for the stupidity of excess hubris and unconditional love of ones own theories and ideology.

In the 1st decades of the 21st century, most Third World communities are transient. As we have discussed elsewhere ⁵⁶⁶, most post-colonial territories *are* in various stages of change. They are slowly, but inevitably, metamorphosing into communities which exhibit similarities with the pre-colonial communities from which they came.

Western peoples are faced with a difficult decision:

★ ignore the changes and continue to assert with Rostow and his many followers that Third World communities are still in the process of

metamorphosing into capitalist nations - it's just taking longer than we expected!

- ★ attempt to prevent the changes;
- ★ accept the changes and live with the consequences ⁵⁶⁷.

I remember, as a young child, reading a story about a little Dutch boy who was walking to school alongside a dyke wall. He had been told by his father that if he ever saw a leak in a wall he should immediately warn adults of it so that the dyke could be repaired before disastrous failure. Being a conscientious little boy, he would scan the wall as he walked, acutely aware of his responsibility for protecting his community from disaster.

On this particular morning, he saw a tiny hole in the wall and, realizing that this could be disastrous, decided that the best thing to do would be to stick his finger into the hole to stop the water from breaching the dyke wall. The story ⁵⁶⁸ has poor little Hans dying in his successful attempt to save his community from disaster.

As I read the story my mind worked overtime (as the minds of small boys are wont to do). What would happen if little Hans was standing there with his finger in the hole and, a little further down the dyke wall, another hole should appear? Perhaps we would have little Hans attempting to save a small part of the wall while all the rest disintegrated around him!

Welcome to the 21st century!

Western governments and international organizations find themselves with their fingers in dyke walls. If they don't keep the holes plugged, the walls around them will collapse. And more and more holes are appearing all the time.

We're going to be busy people if we're going to keep all the holes plugged in this century!

As we examine post 2nd World War experiences in Third World countries, we need to bear in mind that these experiences mask a deep, historical disruption of non-western communities. Those communities were, all-too-often, forcibly included in Western European colonies, with scant regard for their own peculiar identities, to serve the interests of the colonizing powers.

That disruption, however, did not result in the loss of pre-European understandings of the world. It merely obscured them. The chaos and turmoil found in many non-Western countries in the early 21st century can be traced back to their experiences over the past 150 years ⁵⁶⁹.

Examples of non-Western Understandings of Reality 🐼

To understand the differences between Western capitalist communal organization and interaction and the pre-existing forms of organization and interaction in non-Western communities, we need to examine how such communities were organized before colonisation by Western European powers. This is, of course, how they still would be organized - with inevitable accommodations to outside influences - if left to their own devices.

To do justice to such a preliminary exploration of non-Western forms of understanding and organization is beyond a discussion of this kind. The best we can do here is refer to two explanations of such communities which can

be accessed on the Internet. The discussion which follows will bounce off those explanations.

The first example is an excellent study by Paul Liffman of the "Wixaritari (Huichols) in the community of San Andres Cohamiata", living in 90,000 square kilometres of western and north-central Mexico. The study was part of a larger undertaking by a team of anthropologists studying the people of the region. The *Journal of the Southwest*, (^œ[Vol. 42 Issue 1, 2000](#)), has a number of other research articles by team members, focusing on similar issues in the region.

In this study, entitled ^œ[Gourd vines, Fires, and Wixarika Territoriality](#), Paul Liffman introduces us to an understanding of the world which is completely different to anything that people in Western capitalist communities experience or understand. Here is Liffman's explanatory summary:

Wixaritari (Huichols) in the community of San Andres Cohamiata say that the genealogies and social bonds constructed in ritual grow along divine ancestral migration paths, just as gourd vines grow out across the earth.

These ancestral vines connect the ceremonial fire of the xiriki (shrine) of a kie (rancheria), where people live, to a great temple (tuki), from which the kie's founding ancestors first "borrowed fire," to creation sites throughout 90,000 square kilometers of western and north-central Mexico.

If the rancheria expands and ramifies like a gourd vine, those ancestors' descendants must "borrow" and "register" (inscribe or legitimate) new fires, and their xirikite ultimately grow up to be tukite.

This historical process of establishing land tenure ceremonially entails fulfilling cargos (five consecutive annual cycles of ritual obligations) at the tuki, from which people make the growing gourd vine paths of divine descent extremely vivid by retracing them in sacrificial treks to the creation sites, most notably Wirikuta, the birthplace of the sun.

It is always extremely difficult for anyone to begin to see the world from a perspective that has so little in common with their own. This is why most Western people simply don't attempt it, convinced that, even if the Wixaritari and other non-Western communities do see their worlds and interact with them in such radically different ways, their ways must be riddled with superstition and highly illogical.

Concepts such as private property and public property, economic activity and political activity, fit very poorly into an understanding of the Wixaritari world. Liffman's description of Wixaritari understandings of and interactions with the land on which they live gives a graphic illustration of the differences:

Wixarika land tenure is based on a fundamentally reciprocal-although most certainly hierarchical-Mesoamerican sacrificial economy. As with other Uto-Nahuan groups such as the Nayari (Coras) and Mexika Aztecs, the ideological basis of this system is exchange between people and the divine ancestral owners of the earth, rain, and sun.

Living people, divine ancestors, and the cosmological divinities are connected through sacrifices and offerings, at key sites of the landscape (particularly at primeval emergence sites situated in caves and springs; cf. Coyle, this volume ⁵⁷⁰).

As a result, relating the origin myths of the landscape to the site where they are narrated and leaving offerings at key points of the landscape where divine history happened so that the earth will continue to produce are intrinsic to Wixarika land tenure and political legitimacy in general.

To rewrite their understanding of their polities and systems of land tenure and use in Western terms would result in the loss of most of the meaning which they consider inherent in the *real* world, objective reality for the Wixarika. To impose Western democratic political organization and forms of individualized land ownership and use on them would directly challenge and deeply undermine their communal organization and understanding of reality.

An entirely different set of communities, the San (commonly called 'Bushmen') of the Kalahari in south west Africa, illustrates a very different approach to understanding and interacting with their environments. In an article entitled ^{ae}*Those who have each other: San relations to the land*, Edwin Wilmsen (1989, pp. 58-9) examined a range of understandings of San kinship available in the literature and concluded that among that subgroup of the San known as Zhu,

Kinship in Zhu society, rather than being a static straitjacket, is a dynamic keyboard on which individuals play variations on a theme of options. It is, as Comaroff (1982:164) notes, up to the individual to "create and manage an effective social network."...

Within this incorporative structure of kinship, the corporate unity of Zhu landholding devolves from one generation to the next.

Property right transfers consequent on marriage are, accordingly, largely matters of reshuffling priorities among latent claims by members of a kin consort. Negotiations for, and legitimation of, marriage ties are important moments in this creative process.

To condense Bourdieu (1977:34-36; original emphasis): "to treat kin relationships as something people *make*, and with which they *do* something, is not merely to substitute a 'functionalist' for a 'structuralist' interpretation ... it is radically to question the implicit theory of [kin relationships] 'in the form of an object or an intuition' as Marx puts it.

In this perspective, Zhu bride service can be seen... as a form of devolutionary marriage payment that mediates the conflicts over land that inevitably must occur among mutually interdependent groups....

For Zhu, bride service resolves the question of personal status and locates a marriage union with its offspring within the structure of relations between persons and places. The devolution of property begins with negotiations and prestations between principals to a future marriage, primarily future co-parents-in-law.

This process may extend over a period of many years....

Devolution begins to take more concrete form with the establishment of a new household located in association with the woman's parents. The period of bride service is measured in terms of offspring, its conditions having been satisfied when two or more children have been born to the union.

(1989, pp. 58-9)

Zhu social relationships and systems of land tenure and utilization are intimately intertwined. One cannot be understood without understanding the others. Zhu communities (like other Kalahari San communities), might appear organizationally simple to Western eyes, but the realities are a complex network of subtle relationships and negotiations which the Zhu consider features of the objective reality within which they live.

The Zhu have not escaped the ravages of Western capitalist 'development'. Theirs is a sadly familiar tale replicated in thousands of hunter-gatherer communities around the world. As [Gilbert Murray, in 1900](#), said of Australian Aboriginal experience at the hands of Western peoples:

The Kanakas in Queensland, under the old indenture system, were no doubt treated both harshly and unfairly. They were kidnapped, they were brutally used, they were cheated of their miserable earnings.... But go, if you dare, into a searching comparison between the treatment of the Queensland Kanakas, who were useful beasts of burden, and that of the Queensland aborigines, who were regarded as vermin, and you will bless the lot of the half-enslaved Kanaka.

James Suzman has described the fate of the Zhu (or Ju) over the past decades of capitalist 'development':

A century ago the Ju/'hoansi were undisputed masters of this desert land. But then white farmers and colonial police arrived with their horses, guns, water-pumps, barbed-wire and cattle. They soon crushed what little resistance the Ju/'hoansi offered and claimed this land for themselves. They also quickly learnt that farming in the Kalahari Desert was labour intensive. So they formed commandos to capture "wild Bushmen", held the Ju/'hoansi's children hostage to ensure their parents' obedience and meted out regular beatings to teach them the "virtues of hard work". Deprived of their traditional lands and regarded as "childlike-like creatures of the bush", Ju/'hoansi soon became dependent on the farmers for a place to stay and food to eat.

When Namibia gained its independence from South Africa in 1990 technological advances meant that the farms were more productive and less dependent on labour than they had ever been before. And with a new government demanding that farmers provide proper pay and housing for their workers, they reduced their workforces to the bare minimum leaving many Ju/'hoansi and their dependents little option but to descend on squatter settlements like Canaan....

(James Suzman, [Gatherers May Hold the Key to our Economic Future](#): We need to rethink our relationships with the workplace, *Economics*, February 10 2018)

It is common to all human beings that they believe that their ways are the best ways and that where other people deviate from their ways they are less than rational. Western Europeans are not exceptions to this rule. They demanded change from these groups, not because the practices they opposed were inherently bad or evil (if there is a universally valid set of criteria in terms of which such judgments can be made) but because they conflicted with their own understandings.

The Wixaritari and San communities were not passive. They reacted to the changes brought into their communities with the expansion of capitalist activity into their environments by altering communal organization, land tenure and use to accommodate changed demands. In doing so, they

attempted to ensure that the fundamental presumptions in terms of which they related to their environments were preserved and maintained.

This has always been the response of non-Western communities to Western demands for change. Human beings are not able to simply drop their own understandings and live by the understandings of others. They will always try to accommodate changes they can't resist, while retaining their own understandings of the world and of themselves.

When changes forced upon them become more than they can accommodate within their own understanding of the world, they begin to lose a sense of communal identity and their communities begin to unravel ⁵⁷¹. Wixaritari and San communities have experienced these consequences over the past forty years in central America and south west Africa.

Unraveling Communities and Population Growth 🐼

Throughout the world, non-Western communities, subjected to unrelenting demands for massive change in their interaction with their material environments, have experienced similar loss of identity, with rapidly escalating crime and violence and uncontrollable population growth.

All stable communities (both historically and in the present) have both direct and indirect means of limiting population growth. As communities disintegrate, the means of population control become decreasingly effective and population begins to grow.

Many non-Western communities have experienced rapidly increasing population growth as their communities have unraveled. The current average annual rate of population increase through sub-Saharan Africa is 2.4 percent. At this rate of increase, populations double every 30 years. Through all of the non-Western regions of the world the average annual rate of increase is 1.6 percent, with populations doubling every 44 years.

The pressures put on both material and social environments by these rates of increase are enormous.

Through the Western world, the average rate of increase is a mere 0.5 percent, with populations doubling over 139 years. Given that there are always natural events over such a period which impact on growth, Western populations have either stabilised in countries like the United States or, as in Western Europe, with a -0.01 percent annual growth rate, are in decline.⁵⁷² Population increase in Western countries comes through immigration.

People like the Wixaritari and San, don't simply reinvent themselves as Western capitalists when they are subjected to Western capitalist demands for change. They lose their sense of identity and self-worth as their indigenous status and prestige systems break down and their understanding of their environment and of themselves in terms of their environment decreasingly 'makes sense'.

Status, Possessions, Land Tenure and Utilization 🐼

 (13/04/24)

People in most non-Western communities determine relative status through competitive and/or cooperative involvement in *non-material* forms of activity (e. g. ritual events, festivals, religious activities, kinship and other social involvement and activities together with involvement in the material environment). They, then, very often, require people who attain particular

statuses to demonstrate their fitness for the statuses attained by obtaining the material possessions deemed correct for the status positions.

If they cannot obtain the necessary possessions, their statuses come under threat. If, on the other hand, they accumulate *more* possessions than they should, or obtain inappropriate possessions, then the rest of the community reacts, wanting to know who they think they are.

People who are able to get more than they should have usually feel an inner compulsion to limit their acquisitions in some way. If they are not able to do this, they usually feel it necessary to give the surpluses away. In doing so they can strengthen ties with other community members.

There are, of course, communities which do not tie possessions to status in this way. In such communities (e. g. the San of the Kalahari or Aboriginal Australian communities) status is not clearly linked to the accumulation of possessions and owning things does little or nothing for either status or prestige. See Sahlin (1972) for a discussion of such communities.

The ways in which communities are organized and the ways in which they interact with their material environments are two sides of a coin. If the organization of the community changes, interaction with their material environment will also change. Equally, if interaction with the material environment changes, so does the structure of the community.

When those changes are forced from outside, based on understandings of which community members are often not even aware, then community members find it increasingly difficult to make sense of their experiences. The changes forced upon them often require forms of interaction which directly contradict the basic forms of interaction of the community.

Attack the systems of land tenure and utilization in a community and you attack the organization and interactions of the community. You cannot force change in land tenure and utilization without directly attacking the cohesion of the community which reflects and incorporates those systems in its organization.⁵⁷³

These are not merely problems of the past, practices long-since abandoned by a more enlightened Western World. They are increasingly problems of today and of the future. William Laurance and co-authors have spelt out some of the problems facing the African continent:

It is possible that, in recorded history, no continent has ever changed as rapidly as is presently occurring in Africa. For instance, the extractive-industries boom in Africa is notable not so much for its direct effects - which will be substantial -...but for the powerful economic impetus it is providing for new roads and railways needed for extracting high-volume minerals such as iron and coal. Development corridors promoted by Africa's mineral boom are also seen as prime locations to expand and intensify agriculture.

(William Laurance, Sean Sloan, Lingfei Weng and Jeffrey Sayer, [Estimating the Environmental Costs of Africa's Massive "Development Corridors"](#), *Current Biology*, Volume 25, Issue 22, November 16, 2015)

Bill Laurance has described the process in the Congo Basin:

Logging roads are expanding dramatically in the Congo Basin, leading to catastrophic collapses in animal populations living in the world's second-largest rainforest, according to research co-led by a scientist at James Cook University in Australia.

Just as worrying is that the rate of forest destruction caused by new roads in the Congo Basin has risen sharply over time, quadrupling since 2000.

"The situation in the Congo Basin is scary on top of more scariness," said Professor Bill Laurance, who has worked in Africa for 15 years. "New roads are opening a Pandora's box of activities such as illegal deforestation, mining, poaching and land speculation."

... [S]ince 2003, the total length of roads has increased by nearly 100,000 kilometres--from 144,000 to 231,000 kilometres overall.

"Industrial logging is a key economic driver for much of the road building," said Laurance. "Some logging roads are abandoned, but many are used by slash-and-burn farmers and poachers to penetrate deep into surviving rainforests."

(*EurekAlert* News Release, ["Roads and deforestation explode in the Congo basin"](#), James Cook University, 24-Jun-2019)

Five years on, in 2024, the devastating consequences of 'land grabbing' by international corporations, cartels and finance houses has accelerated. As Yves Smith, in a ["Naked Capitalism"](#) posting of Salena Tramel's article posted on *Common Dreams*: ["5 Things to Know About the Global Land Rush and How to Stop It"](#), has put it:

Americans have likely read about squillionaires here buying huge ranches and other tracts of land. They may not be as aware of everyone from US hedge funds to the Chinese buying agricultural land in Africa. Mineral and water rights are another part of this equation that this article does not mention; they are often sold by landowners either for profit or survival reasons. Nevertheless, due to the great geographic spread of this activity plus the fact that in many cases, the transactions are reported only in local government registers, it's extremely difficult to get a handle on the scale.

An *Agrarian Conversations* paper entitled ["LDPI Working Paper Series: International Conference on Global Land Grabbing - Bogota, Colombia"](#) provides a 2024 list of relevant working papers on related issues.

As noted earlier, capitalist 'acquisition' of lands and resources in non-Western regions of the world rides rough-shod over the rights and needs of local communities. When lands and resources are 'privatized', communities in the regions in which those 'assets' are found become disenfranchised, impoverished and dysfunctional.

This is simply another version of capitalist colonialism, perpetrated by capitalist organizations intent on 'mining' the 'assets' they acquire for 'profit', without regard for the peoples whose lands and resources they have alienated.

How desperately the world needs a revolution which prioritizes the needs and rights of resident communities over the greed of a few 'profit-driven' corporations and cartels.

Brutality, Despotism, Corruption and Communal Disintegration 🦋

 (08/01/17) (19/01/17) (08/08/17) (07/12/17) (24/05/18) (02/08/18) (01/04/21) (22/04/21) (17/06/21) (04/07/21) (09/12/21) (12/12/21) (15/06/23)

In a world shaped by three centuries of rampant capitalist 'development', we find ourselves, as human beings, sharing this uniquely habitable planet not only with each other but [with more than 8 million other species](#).

Capitalism, however, has been driven not by shared responsibility for this world in which we live but by a myopic focus on 'the bottom line'.

Everything and everyone has been either willingly or unwillingly co-opted by a system they are required to serve. For capitalists, as the British prime minister Margaret Thatcher explained, 'There is no such thing as society. There are individual men and women'. And, since capitalism only values that which it can price, those disaggregated individuals are [only 'of value' if they can contribute](#) to that 'bottom line'.

The breakdown in law and order and in living standards among indigenous populations resulting from the complete disruption of their communities and individual lives has been [inevitable, inescapable and 'necessary' to ensure that they acquire 'the capacities needful for civilized life'](#)

One of the saddest features of the 'Third World Development' drive in which Western capitalist nations have engaged over the past fifty years is that in the process of reorganizing utilization of their environments, [non-Western communities have been disrupted](#). Many of them are in various stages of disintegration, victims of the well-meaning 'development' activities of Western experts.

As the consequences of disruption have become increasingly apparent, in a classic 'blame the victim' response to the problems created, those same experts have urged further, deeper change to address the problems of social disintegration which their policies have induced.

Because they have been well trained as Western specialists, they take it for granted that their understanding of the world, and their forms of land tenure and utilization are the only 'reasonable' ones. So they force change upon those who don't see the world as they do or relate to the material environment as they do.

A leader in the magazine *The Economist*, entitled 'Hopeless Africa', put the Western perspective well,

No one can blame Africans for the weather, but most of the continent's shortcomings owe less to acts of God than to acts of man. These acts are not exclusively African - brutality, despotism and corruption exist everywhere - but African societies, for reasons buried in their cultures, seem especially susceptible to them.

(^œ[The Economist May 13th-19th 2000](#))

Brutality, despotism and corruption in communities are evidences of *communal disintegration*, not features of 'traditional cultures' as the *Economist* writer suggests.

As ^œ[Gustave Speth](#), Administrator of the United Nations Development Program, said of Africa in 1994(a):

We conveniently forget Africa's history. We forget that the transatlantic slave trade robbed Africa of about 12 million of its able-bodied men and women. We forget that colonialism which followed the slave trade introduced a system of exploitation of Africa's natural resources to feed the industries of the West.

We forget the 1884/1885 Colonial Conferences of Berlin which crudely Balkanised and divided Africa into geographic areas of control by the West, with scant regard for ethnic groupings. We even forget that during the period of the cold war's geopolitical fight for spheres of influence, Africa became a focal point for the ideology and the arms

that today contribute to the havoc we find in Rwanda and Burundi, in Zaire and Angola and Somalia.

Western capitalist developers have intruded into communities and [changed the face of the material environments of peoples](#). They have forced new land tenure and utilization practices upon them, extracted huge 'surpluses' from their environments and now blame them for the ensuing social, political, and material environmental disintegration.

But, they have done much more than this. They have pursued 'development' at the expense of long run environmental damage to both land and sea.⁵⁷⁴

Western 'civilization' has, indeed, [set the earth on an ominous trajectory](#). Nothing can be allowed to stand in the way of 'Western Development'.

The future will take care of itself. All that matters is that the accumulation of what 'free market' capitalism has defined as 'wealth' - produced by capitalism's entrepreneurs and '[wealth accumulators](#)' - grows each year.

The warnings of the doomsayers can be ignored if they threaten that growth. One such warning, published on May 18, 2018, once again spells out the consequences of this [myopic pursuit of 'wealth'](#):

...[A] new analysis... shows the Earth's climate would increase by 4°C, compared to pre-industrial levels, before the end of 21st century... said Dabang Jiang, a senior researcher at the Institute of Atmospheric Physics of the Chinese Academy of Sciences. "The temperature increase would cause severe threats to ecosystems, human systems, and associated societies and economies."

In the analysis, Jiang and his team used the parameters of scenario in which there was no mitigation of rising greenhouse gas emissions. They compared 39 coordinated climate model experiments from the fifth phase of the [∞][Coupled Model Intercomparison Project](#), which develops and reviews climate models to ensure the most accurate climate simulations possible.

...[M]ost of the models projected an increase of 4°C as early as 2064 and as late as 2095 in the 21st century, with 2084 appearing as the median year.

([∞][Earth's climate to increase by 4 degrees by 2084](#), *Institute of Atmospheric Physics, Chinese Academy of Sciences*, 23 May, 2018)

We have learned nothing. For all the posturing and pseudo-concerned pronouncements of capitalism over the past several decades, 'development' activities, driven by the 'needs' of capitalism, are ensuring a rapidly degrading world.

It appears that, as the 21st century unfolds, it's going to be half-baked '[Green New Deals](#)' for the West and similarly [∞][half-baked 'Green Revolutions'](#) for the Rest!

Timothy Wise and Jomo Sundaram described yet another Western promoted 'development' initiative in 'Africa'. One of those mega-wealthy '[philanthropists](#)' spawned in the West over the past half century decided (in 2006) that he and his 'organization' would 'double yields and incomes for 30 million smallholder farm households while halving food insecurity by 2020'. As the authors ask 'When will we ever learn?' ⁵⁷⁵

Since the Alliance for a Green Revolution in Africa (AGRA) was launched in 2006, yields have barely risen, while rural poverty remains endemic, and would have increased more if not for out-migration.

AGRA was started, with funding from the Bill and Melinda Gates Foundation and the Rockefeller Foundation, to double yields and incomes for 30 million smallholder farm households while halving food insecurity by 2020.

There are no signs of significant productivity and income boosts from promoted commercial seeds and agrochemicals in AGRA's 13 focus countries. Meanwhile, the number of undernourished in these nations increased by 30%!

William Laurance and Irene Burgués Arrea neatly summarized the era:

We are living in the most explosive era of infrastructure expansion in human history. In the next 3 years, paved roads are projected to double in length in Asia's developing nations; in the next three decades, the total length of additional paved roads could approach 25 million kilometers worldwide - enough to encircle the planet more than 600 times. Nine-tenths of all new infrastructure is being built in developing nations, mainly in tropical and subtropical regions that contain Earth's most diverse ecosystems. In a world that is projected to have 2 billion vehicles by 2030, we need a better understanding of the impacts of roads and other infrastructure on our planet, societies, and economies - and more effective planning to ensure that the benefits of infrastructure outstrip its costs....

Waves of new roads cutting into intact or critical habitats can unleash a Pandora's box of environmental ills, such as land encroachment, wildlife poaching, forest fragmentation, exotic-species invasions, and illegal mining. Even carefully managed projects can provoke societal hazards such as land speculation, corruption, cost overruns, and political conflict. In worst-case scenarios, projects can collapse, stranding large financial investments and natural assets. Unpaved tropical roads can quickly become unusable because of deep rutting from vehicle use in the wet season. For such reasons, road-expansion schemes have inconsistent, and sometimes clashing, impacts on human needs, as illustrated by their widely varying effects on the United Nations Sustainable Development Goals.

(William F. Laurance and Irene Burgués Arrea, ^œ[Roads to riches or ruin?](#), *Science*, Vol. 358, Issue 6362, pp. 442-444, 27 October, 2017 (See original for documentation))

In 2021, with its own [internal infrastructures in disarray](#), its social services [corporatized](#) and [privatized](#), the US Administration has decided that it "should have an infrastructure plan to rival China's Belt and Road initiative"

Of course, the US (and other Western nations') neoliberally inspired infrastructural crises have been a long time in the making. Biden, as vice president for 8 years and, before that, a hawkish ^œ[Senate advocate of gutting social services](#) and defunding infrastructure maintenance, now suggests that in order to counter China's rising influence around the world, Western nations need a multi-trillion dollar 'plan'.

And, of course, since the incongruity of developing an infrastructure plan to rival ^œ[China's Belt and Road initiative](#) while the infrastructures of their own nations are in disrepair does not escape even Biden⁵⁷⁶, he also proposes a multi-trillion dollar US internal program.

President Biden spelt out what must surely have been one of those 'bright ideas' politicians get from time to time. The prime question to be asked (and answered by Biden) is, of course, how will they fund such programs?

If, in line with Biden's Senate record, he envisages either private sector initiatives or '[Public-Private Partnerships](#)' funded by Government, then what he is suggesting is that the US and its allies should unleash the 'power of private enterprise' not only on the rest of the world but ^œ[on the United States itself](#)!

It would be difficult for Biden and his 'team of immaculate professionals' to comprehend, much less deliver, the kinds of state to state infrastructural programs delivered by China's Belt and Road Initiative⁵⁷⁷.

Biden's 'bright idea' during a phone call:

U.S. President Joe Biden said he suggested to British Prime Minister Boris Johnson in a phone call on Friday that democratic countries should have an infrastructure plan to rival China's Belt and Road initiative.

"I suggested we should have, essentially, a similar initiative, pulling from the democratic states, helping those communities around the world that, in fact, need help," Biden told reporters.

China's Belt and Road Initiative (BRI) is a multi-trillion-dollar infrastructure scheme launched in 2013 by President Xi Jinping involving development and investment initiatives that would stretch from East Asia to Europe....

Biden's remarks came after he said on Thursday he would prevent China from passing the United States to become the most powerful country in the world, vowing to invest heavily to ensure America prevails in the ever-growing rivalry between the world's two largest economies.

Biden plans to unveil a multi-trillion-dollar plan to upgrade U.S. infrastructure next week. He said on Thursday this would ensure increased U.S. investment in promising new technologies, such as quantum computing, artificial intelligence and biotechnology.

While airing its concerns and seeking to encourage private sector-investment for overseas projects to rival those of the BRI, Washington has yet to be able to convince countries that it can offer an alternative to the state-backed economic vision put forward by Beijing under BRI.

Over 100 countries have signed agreements with China to cooperate in BRI projects like railways, ports, highways and other infrastructure. According to a Refinitiv database, as of mid-last year, over 2,600 projects at a cost of \$3.7 trillion were linked to the initiative.

(Jarrett Renshaw, ^œ[Biden says he suggested to UK's Johnson a plan to rival China's Belt and Road](#), *Reuters*, March 27, 2021)

In a largely photo-opp G7 Conference (11-13 June 2021) President Biden unveiled his 'plan' to rival China's 'Belt and Road' program. It has been called 'Build Back Better' and the European Union along with the other attending nations has pledged to support it.

The name suggests little more than the [current piecemeal 'aid' program initiatives](#) to which these nations have committed constantly diminishing resources over the past few decades. It certainly lacks the directive structure and infrastructure of the Belt and Road initiative. As ^œ[British](#)

Prime Minister Boris Johnson extrapolated: "We should build back greener; build back fairer and more equal; in a more gender-neutral and perhaps more feminine way"

Four months later, the US 'Build Back Better' Act had [received the usual treatment](#) from both sides of politics. Sasha Abramsky explains:

...[E]ven if the Build Back Better Act does pass, due to the huge scalebacks that conservative Democratic Senators Joe Manchin and Kyrsten Sinema have demanded, what once had the potential to be transformative in the way that signature New Deal and Great Society programs were is now in part reduced to being another public display of the dysfunction of Washington, D.C., in the face of overwhelming challenges, and in the churn of a tsunami of lobbying efforts against the legislation by business groups such as the Chamber of Commerce and the Business Roundtable.

(Sasha Abramsky, [The Centerpiece of the Build Back Better Climate Plan Has Been Stripped Out](#), *Truthout*, October 29, 2021

It seems that, indeed, 'it's only words!' The real program is much darker, much more [threatening to world-wide peace and security](#)!

The 'economic' bottom-line has proved far more potent in driving and shaping Western and other capitalist development activities over the past decades than the [increasingly certain environmental catastrophe which is looming on humanity's horizon](#). As a 1955 Pete Seeger song put it: "When will they ever learn?"

Open-ended and Closed Utilization of the Material Environment 🐼 (The Key to Sustainable Lifestyles)

 (12/02/16) (19/02/17) (28/08/17) (07/05/19)

We need to understand the single most important difference between almost all non-Western orientations to the material environment and that of Western capitalism.

- ★ Western capitalist utilization of the material environment is open-ended, with [no upper limit to its use and a built in inflation of demand](#) for natural resources.⁵⁷⁸
- ★ Most non-Western forms of utilization are *closed*, with a [built in upper limit to demand](#).

This is *not* because non-Western people are 'more attuned' to their environments or because they are 'natural conservationists' or 'closer to the environment' than Western people.

As many studies have shown, non-Western people have shaped and molded their environments to their needs. Their aim has not been to 'live in harmony with nature', as sometimes suggested by environmental activists in Western countries, but to utilise their environments to supply their needs and wants.

However, because their status and prestige systems have not been anchored in the accumulation of material goods and services but in some other form of activity and organization, there has been no inbuilt pressure to over-use their material environments.

Where they have done so (and this has often happened), it was the growth in population living in a region which produced problems⁵⁷⁹, not a constantly escalating demand from a stable population for more and more material possessions and ever-increasing levels of consumption, as in Western communities.

Most human activity is related not to subsistence but to the promotion and maintenance of social position and self-esteem. People in communities like those of the Wixaritari and San are focused on something other than 'private enterprise' and competitive individual material accumulation and consumption as the basis of status. So, they spend less time in material production/ consumption activities and more time in what Western capitalist people would consider 'waste' activity: in religious, ritual, social and kin-based activity of various kinds.

If they are being 'productive' what they are producing is not material goods and services but various forms of ritual, religious and social activity and organization - whatever is required of the status system which is built into the structure of their communities and into their forms of interaction with each other. So, in many non-Western communities such activities seem extravagantly elaborated to Western people.

The upshot of this focus away from the material environment is that, in the past, they more or less matched their material needs and wants to what was available in their own environments or could be traded for goods from their environments without needing to expand into the territory of neighboring groups.

Sahlins (1972) argues that many communities *underused* the resources available in their material environments. Since they matched their material needs and wants to the usual productive capacity of their environments, in good years they had surpluses and in bad years they had less than they required, but things averaged out over the years.

With material needs and wants socially circumscribed, the technologies necessary for their production remained relatively stable. There is little need to develop more sophisticated, efficient, and streamlined production techniques and technologies where those which have been developed provide both the quantity and quality of goods required and where requirements do not constantly escalate⁵⁸⁰. Rather, people spend their time in pursuits which directly relate to the requirements of the social templates of their communities, through which they achieve increased social status and respect.

When Western people arrived in non-Western regions, they demanded that those communities produce a 'surplus' from their material environments for export to Western countries. This required local inhabitants to use their material environments not only to supply their own needs and wants, but to supply, additionally, a range of products sought by Western traders and 'developers'.

Utilization of their environment was, therefore, almost immediately, raised to long-run unsustainable levels.

Inevitably, the environments of communities where these demands were made became progressively more degraded as the years passed. As Gustave Speth (1994(b)) claimed⁵⁸¹, most of the soil and other environmental deterioration of the past fifty years has occurred in non-Western regions of the world. Westerners use their own environments to the

limits of sustainability, but readily, and unthinkingly, push the environments of other communities over the edge. (For more on this, see [Rights and Resources 2011-2012](#))

The Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) has summed up the situation in 2019:

Nature is declining globally at rates unprecedented in human history - and the rate of species extinctions is accelerating, with grave impacts on people around the world now likely, warns a landmark new report from the Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES), the summary of which was approved at the 7th session of the IPBES Plenary, meeting last week (29 April - 4 May) in Paris.

"The overwhelming evidence of the IPBES Global Assessment, from a wide range of different fields of knowledge, presents an ominous picture," said IPBES Chair, Sir Robert Watson. "The health of ecosystems on which we and all other species depend is deteriorating more rapidly than ever. We are eroding the very foundations of our economies, livelihoods, food security, health and quality of life worldwide."

"The Report also tells us that it is not too late to make a difference, but only if we start now at every level from local to global," he said.

"Through 'transformative change', nature can still be conserved, restored and used sustainably - this is also key to meeting most other global goals. By transformative change, we mean a fundamental, system-wide reorganization across technological, economic and social factors, including paradigms, goals and values."

"The member States of IPBES Plenary have now acknowledged that, by its very nature, transformative change can expect opposition from those with interests vested in the status quo, but also that such opposition can be overcome for the broader public good," Watson said. The IPBES Global Assessment Report on Biodiversity and Ecosystem Services is the most comprehensive ever completed. It is the first intergovernmental Report of its kind and builds on the landmark Millennium Ecosystem Assessment of 2005, introducing innovative ways of evaluating evidence.

Compiled by 145 expert authors from 50 countries over the past three years, with inputs from another 310 contributing authors, the Report assesses changes over the past five decades, providing a comprehensive picture of the relationship between economic development pathways and their impacts on nature. It also offers a range of possible scenarios for the coming decades.

Based on the systematic review of about 15,000 scientific and government sources, the Report also draws (for the first time ever at this scale) on indigenous and local knowledge, particularly addressing issues relevant to Indigenous Peoples and Local Communities.

"Biodiversity and nature's contributions to people are our common heritage and humanity's most important life-supporting 'safety net'. But our safety net is stretched almost to breaking point," said Prof. Sandra Díaz (Argentina), who co-chaired the Assessment with Prof. Josef Settele (Germany) and Prof. Eduardo S. Brondízio (Brazil and USA). "The diversity within species, between species and of ecosystems, as well as many fundamental contributions we derive from

nature, are declining fast, although we still have the means to ensure a sustainable future for people and the planet."

(Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES), ^œ[Media Release](#), 04 May, 2019)⁵⁸²

In the jargon of Western capitalism, non-Western communities, prior to Western intrusion, were naturally oriented to 'sustainable lifestyles', to *living within their environmental means*. This is why such advanced material cultures as those of Han China, Korea and Japan, although well aware of the existence of other lands and peoples, and although placing neighboring peoples into tributary relationships, did not greatly expand their accumulative and productive activities into their environments.

For the Chinese, Koreans and Japanese, throughout thousands of years of elaborate political organization and advanced material culture, North America was less than a week's sailing time away. And they had the sophisticated craft necessary to make such journeys with ease on a regular basis. Yet, when Western Europeans invaded and subjugated the indigenous inhabitants of the North American continent there were no communities of Chinese, Koreans or Japanese to deal with.

Why not?

Because, despite their elaborate material cultures, status and prestige were not primarily determined by competitive individual material accumulation and consumption. They, more or less, lived within their environmental means.

This is equally true of Aboriginal Australians. Of course they reshaped their environment to better suit their requirements, and of course that meant that Australia, after their arrival, was a different land to Australia before their arrival. But they did not utilise their material environment to, and beyond, its limits. They did not, in Western capitalist terms, 'realize the potential' of their material environments.

As Tonkinson (1978, p.18) put it, Aboriginal people stressed, not the mundane skills and techniques for surviving in harsh surroundings, but "the imperative of conformity to Dreamtime laws... it is spiritual rather than ecological imperatives that have primacy in guaranteeing their way of life".

The Aboriginal people of Australia, like non-Western peoples in most parts of the world, understood reality, and interacted with the world in ways which are difficult for Western peoples to understand.

Enter the Europeans 🇪🇺

 (03/01/16)

With the advent of capitalism in Europe as the driving force to individual and communal activity, Western Europeans set out to discover the "riches" of the world and appropriate them⁵⁸³.

From the early predatory adventures of traders, explorers and privateers, to state and capitalist enterprise organized invasions of the rest of the world, Western Europe imposed its self-interested ambitions on the planet. Over five hundred years it metamorphosed from an insular feudally organized region into a rampant colonizing power. By 1914 it controlled more than 80% of the world. And it controlled it for one reason: to exploit its resources.

Not only was there very little interest in the organization and understandings of the communities they invaded, there was little or no understanding of, or interest in, the consequences of their activities for invaded populations. As Gilbert Murray explained for the British (and his explanation could be applied with equal or greater force to the other Western European colonizing powers),

A slave is ultimately a man spared in war; a man whom you might kill, but whom you prefer to keep, in order to make him work for you.

It is abundantly clear, if one considers the question, that this has historically been the position of most of the subject races in the British Empire. And it is in a sense their condition still. Those whom we cannot utilize we exterminate; those whom we can utilize we protect, and often enable to increase in numbers.

(œ1900, p. 152)

Obafemi Awolowo was equally clear in describing the British invasion of Nigeria,

Britain ... sought to impose her rule on the various tribes that inhabited the country in order to attain her own selfish ends.

There was... no question of trusteeship. This was the result of a later compunction of conscience which usually dawns on any evil-doer who is not hardened beyond redemption.

Those tribes with whom she first came into contact resisted the unwarranted attack on their political independence. They were overpowered by force of arms. Thereafter, each tribe was faced with a choice of one of two roads leading to subjection: defeat or surrender... (1947, p. 24)

The fable held by Western peoples ⁵⁸⁴, from the outset, told a story of humanitarian selflessness. Rudyard Kipling [put into words](#) what the enlightened of Western Europe believed to be their responsibility. They had to:

Take up the White Man's burden -
...To seek another's profit,
And work another's gain....

Fill full the mouth of Famine
And bid the sickness cease...

This [was \(and still is\) the fable](#). The reality was (and is) harsh. As Awolowo explained, "There was... no question of trusteeship. This was the result of a later compunction of conscience which usually dawns on any evil-doer who is not hardened beyond redemption."

When Western people entered non-Western territories, they quickly began to reorganize the invaded environments to contribute to the snowballing production and consumption needs of the West ⁵⁸⁵. They oversaw an expansion in utilization of available resources, stepping up production and export to the raw materials markets of Western Europe.

This ushered in a period in which non-Western regions were reorganized to mass produce particular commodities for European markets. Regions became devoted to 'mono-agricultural' export, to large-scale production of a very few primary commodities for export ⁵⁸⁶, rather than for the communities whose environments were reorganized. Where mono-agricultural development in large holdings was not feasible, indigenous

communities were re-organized to emphasize cash-cropping, producing agricultural products required for European markets on small-holdings.

Over time, such regions became very vulnerable to fluctuations in market demand for their produce. In any period of economic downturn in the West, local people, increasingly reliant on cash income from commodity exports for their subsistence, found their source of income diminished, and therefore their subsistence under threat.

Further, the inherent drive of the capitalist system to reduce costs, resulted in constantly decreasing returns to raw materials producers. In turn, this resulted, inevitably, in constant pressure to increase production quantities. Naturally, this led to further pressure on prices and a spiral of over exploitation of the environment simply to maintain subsistence lifestyles ⁵⁸⁷.

Once Western economic forces gained control in non-Western areas, whether local peoples were or were not oriented to the same acquisitive and consumptive drives as Western people, they soon found their environments being reorganized to suit Western needs.

Increasing numbers found themselves involved in wage labor, in cash cropping, and in placing increasing productive demands on their own environments. And, as in Western Europe in earlier centuries ⁵⁸⁸, increasing numbers of people found themselves displaced from their subsistence resource bases as Western forms of productive organization and ownership were imposed and more and more land became individually owned and committed to commercial crop production.

Since most non-Western communities limited their needs and wants to the productive potential of their own environments, any additional demands, beyond those of their own communities, very soon expanded use of the environment beyond sustainability.

Even where there was no alienation of land for commercial purposes, new demands placed on environments to provide not only for the ongoing needs of local communities, but also crops for sale to gain cash income for new goods offered by Western traders, placed new pressures on local environments. In the long run, the new demands, stimulated by Western trade and directly required by Western authorities, led to the depletion of their resources, and forced increasing numbers of people into wage labor as the primary means of subsistence.

Whether non-Western people adopted Western status systems or not, their environments could not be protected from the constantly escalating productive demands of the West ⁵⁸⁹.

The current environmental crises of the vast majority of Third World countries are not, as many Western experts would have us believe, a consequence of uncontrolled population growth ⁵⁹⁰ and ineffective and inefficient technologies. They are, rather, the consequences of attempting to reorganize non-Western communities to live by Western presumptions. The West has required them to utilise their environments, not only to meet their own needs and wants, but also to contribute to the snowballing needs and wants of the Western world.

The production stimulated in and forced upon Third World communities was not focused on the needs and wants of those communities. It was focused on the needs and wants of Western communities. It was, and still is export oriented production.

We have dealt at some length with the establishment of Western European colonies elsewhere ⁵⁹¹. Here we pick up that story in the post 2nd World War era.

As we deal with issues of the past 60 years, it is important to remember the historical background of those Third World communities. It is equally important to remember that the issues dealt with here are *additional* to all those other problems we have explored elsewhere ⁵⁹².

From Developmentalism to Privatization 🇵🇸

The presumption that governments had a responsibility to manage their economies underwrote political activity in both Western and Third World countries in the post-Second World War years. This assumption, and the practices that followed from it have, in the literature, usually been referred to as 'developmentalism'.

Worldwide economic activity was considered to be the result of the interaction of many separate, but interconnected, 'national economies', each controlled by a national government. Each government tried to ensure that the economy was managed and 'developed' to provide the best possible returns for all community members within its own borders. As colonial territories gained independence, this presumption of separation and responsibility for internal 'development' passed to the new governments - with a little help/direction from their erstwhile colonial masters ⁵⁹³.

It was assumed, by Western authorities, that post-colonial governments had little expertise in managing economies. Most colonial powers used this presumption as justification for retaining strong economic ties and controls. Not only did they provide economic management advice, they linked economic assistance with scrutiny of economic performance. This enabled them to provide constant economic direction as a condition of aid.

Inevitably, therefore, the economies of most post-colonial countries remained strongly tied to economic actors in the former centers of colonial power. Independence brought little change in economic organization or in the established emphasis on export-oriented production, feeding industrial enterprises in the Western World ⁵⁹⁴.

Governments, it was asserted, needed to be funded from within their own territories. A prerequisite for 'take-off into self-sustained growth' in Third World countries was, therefore, the establishment of necessary infrastructures for industrial development.

Money and effort were to be spent on major development projects: on building dams, in constructing ports, in constructing road and rail networks, and other infrastructural requirements of an industrialized country - in the process, creating massive [sovereign debt](#) in those countries.

Whereas it was assumed that First World governments managed their economies in the interests of their populations, Third World governments were assumed to be managing their economies in the interests of 'economic development'.

Primary Product Exports and Import Substitution Industry 🇵🇸

These developments, from 1950 to the 1970s, were assumed to be focused on two kinds of industrial development:

- ★ the export of raw materials and agricultural produce to the Western World,
- ★ and the development of import substitution industry (ISI) within the country.

It was recognized that few Third World countries could develop competitively viable export industries in the short term. It was assumed,

however, that if a range of protective tariffs and import restrictions were imposed on the import of particular commodities, local industries would develop to supply the local market. As they grew in strength, they could then reorient their activities toward export, thus providing a base for further export-oriented production.

This apparently logical development plan was, however, fraught with many hidden pitfalls. As Erica Schoenberger explained,

Investments in developing-country markets such as India, Brazil, Argentina, or Mexico were driven mainly by extremely high protectionist barriers associated with import substitution policies.

In general, these markets were not sufficiently large to sustain optimum volume production, so costs tended to be high in any case (see Holmes 1983; Nofal 1983). Nor were they large enough to allow for fully integrated or wholly self-contained production.

Thus the system as a whole functioned on the basis of long-distance - sometimes extremely long-distance - supply lines.
(Schoenberger 1994, p. 55)

Import substitution policies failed to recognize two fundamental problems.

1. Local businesses, having to import all their technology and rely on overseas expertise in establishing enterprises (as well as supplying a far smaller market than major overseas exporters), could not hope to compete with overseas products. The cost of such import substitutions was usually much higher than that of the previously imported items.
2. In communities which still saw purchased commodities as alternatives to locally-produced items (for which the expertise still existed in most communities), demand fell as price increased.

ISI businesses, with few exceptions, failed to expand as anticipated in the face of falling demand coupled with expanding costs. In some countries industries were, in the interests of development, subsidised to make their products affordable. This, of course, defeated the initial reasons for their establishment. They were supposed to generate revenue for government and provide a base for further industrial development.

A Classic Capitalist Conundrum 🐞

As import substitution failed to fulfill its mooted potential, to meet their growing debt commitments and fund further 'development' activities, countries placed increasing emphasis on the export of primary commodities to generate income. This resulted in constantly expanding production and export of raw materials to industrialized countries.

Until the mid-1960s, with the industrialized world in a period of booming growth following the Second World War, this expansion was absorbed with little reduction in price. However, from the mid-1960s, as industrialized production started to contract in the face of over-supply, prices of primary commodities began to fall.

Countries, relying on primary product sales to fund their development activities and service their debts, found themselves caught in a classic capitalist conundrum:

➤ As prices fell countries needed to export greater quantities to meet their commitments.

➤ As supply increased, prices fell.

↑ Since they had little short-term alternative, Third World countries then had to attempt further to increase supplies to maintain their incomes.

During the same period, First World demand for primary products fell. During the 1980s, primary commodity imports to industrialized countries fell by more than nine per cent, resulting in a primary commodity glut on world markets. Together with the move of labor intensive industry to low-wage regions, these factors led to falling prices for finished goods in industrialized countries and an increasingly serious debt problem in Third World countries.

Third World countries had relied on the twin strategies of primary commodity export and the development of import substituting industry to kick-start their economies into what W. W. Rostow (1961), in a wonderfully optimistic turn of phrase, had called a 'take-off into self-sustained growth'. They found, to their dismay, that the anticipated rewards of their sustained attempts at 'development' had led them into a state of chronic indebtedness.

First World development agencies, looking for reasons for the failure of their confidently promoted development schemes and projects, in large measure found them, not in the rationale of the plans themselves, but in the 'corruption' of Third World governments.

From the mid-1960s, it became fashionable in development circles to speak of the endemic corruption of politics and government in Third World nations. Patron-clientism, which was and is an expression of the 'personalization' of leadership which is standard in most of the world (other than in Western countries), came to be seen as a major obstacle to development ⁵⁹⁵.

Let's 'Add Value' to Primary Product Exports! 🇳🇮

 (08/05/16)

From the early 1970s, with import substitution failing to deliver the expected rewards, and primary commodity prices faltering, development agencies began to look elsewhere for the key to successful Third World development.

An important alternative to import substitution was, obviously, the further processing of primary commodities within the country of origin, rather than shipping raw materials for processing in industrialized countries. Primary commodities should have 'value-added' to them prior to shipment.

Rather than shipping raw materials, money should be spent on processing plant, thus earning exporting countries additional income and, in the process, kick-starting their economies through the establishment of a processing industry which would take advantage of, and stimulate further, infrastructural developments.

Unfortunately, the enthusiasm of 'development experts' once again outstripped their expertise. While it seemed logically sound to develop 'value-added' enterprises in Third World countries, the rationale failed to take into account the existing industries in industrialized countries.

No industry voluntarily commits suicide, and no industry in the industrialized world was going to help a competitive industry in a Third World country to become established.

- The expertise was not provided;
- outdated technology was supplied;
- the supply of raw materials, limited to the country itself, was usually smaller, less reliable and more costly than the raw materials supply to industrialized industry (based on multiple supply sources and competition among suppliers);
- and, most importantly, the network of purchasers established by processing industries in industrialized countries was not available to Third World suppliers.

With all the disadvantages stacked against Third World 'value-added' industry, it was inevitable that Third World enterprises would fail to compete against their well established rivals. Not only was this true, but, given that demand in industrialized countries was shrinking or stalled, the timing for such value-added industrial expansion was less than propitious. Once again, an anticipated success story turned into a financial millstone for Third World countries.

Again, development agencies looked for reasons for the failure and saw the problem not as lying in the development direction established by themselves but in the performance of governments. The reasons for failure lay in the lack of expertise in government, in political interference, in the siphoning of capital out of businesses and into the hands of politicians, bureaucrats and their supporters.

There was substantial evidence that businesses caught in the web of patron-client networks were often milked for funds. However, once again, rather than seeking to understand the phenomenon, patron-clientism and 'corruption' came to be seen as stumbling blocks to economic development.⁵⁹⁶

Government should get out of The Economy 🇺🇸

 (21/07/17)

In the mid to late 1970s, as aid agencies took stock of yet another round of failed plans and projects, they did so in the intellectual and ideological climate of neoliberalism. The problem was now perceived as one of public distortion of private enterprise. Governments should not be involved in economic enterprise. Rather, governments were there to provide a stable backdrop to private economic activity.

As Third World countries, burdened by insupportable debts, [turned to the International Monetary Fund for assistance](#), they found themselves faced with a new set of development requirements. The old had failed, but, at last, aid agencies had the touchstone to development - privatization⁵⁹⁷.

No longer should governments actively seek to develop the economies of their territories. Now they should provide the kinds of political and economic environments which would stimulate the natural entrepreneurial instincts of their populations.

From the mid-1970s, economic conditions began to deteriorate around the world as a result not only of rapidly increasing oil prices resulting from the monopoly practices of OPEC (a cartel formed by major oil producing and exporting countries to control oil prices), but also from a general stagnation in economies around the world.

Everywhere, and in every economic area, the world seemed to be producing more than it could reasonably consume and so markets faltered and prices fell. This provided an excellent platform for economic theorists and practitioners who were opposed to the 'soft', 'uneconomic' policies of developmentalism.

Neoliberal economic experts managed to convince governments everywhere that the only way in which countries could ensure long-term 'economic well-being' was through removing those programs and regulations which distorted 'market activity'. It was in the distortion of processes of economic exchange that the evils of the 1970s and 1980s could be located.

In this brave new world, it would be the responsibility of governments to provide a stable political and social environment and provide the necessary institutional frameworks within which private, independent individuals, whether real or artificial, could engage in uninhibited, competitive, accumulative exchange.

Governments, it was argued, should get out of economics. Economic activity should be 'deregulated'. The presumption was that when markets were freed from government interference, nations and communities would reap the rewards which accrue to those which operate within streamlined, efficient economies. As Haworth described:

Contemporary theoretical discussion around Public Choice Theory, Agency Theory and Transaction Cost Analysis has presented a view of government as parasitical on individual interests and resources. In this critique, politicians and civil servants are transformed from Weberian constructs, offering public service on a professional and vocational basis, to self-interested abusers of resources coerced from the people...

It follows from these arguments that the state as government requires substantial pruning of its purview and an equally important reorientation of its functions. This is perhaps most succinctly captured by Friedman who baldly argued for government which:

... maintained law and order, defined property rights, served as a means whereby we could modify property rights and other rules of the economic game, adjudicated disputes about the interpretation of the rules, enforced contracts, promoted competition, provided monetary framework, engaged in activities to counter technical monopolies and to overcome neighbourhood effects widely regarded as sufficiently important to justify government intervention, and which supplemented private charity and the private family in protecting the irresponsible, whether madman or child ... the consistent liberal is not an anarchist.

[Friedman & Friedman 1962, p. 34]

(Haworth 1994, p. 28)

Neoliberal attitudes to government⁵⁹⁸ were well summed up by Cristobal Kay:

The neoliberals are ... hostile to the state and trade unions, advocating privatization, liberalization, private entrepreneurship and deregulation of the labor markets. The state is seen as the source of most of the development problems of the LDCs [Less Developed Countries].

They argue that state interventionism (or *dirigisme* in Lal's terminology) has created distortions in the price mechanisms which has resulted in the misallocation of productive resources and therefore lower rates of growth. The neoliberal slogan is that imperfect markets work far better than imperfect governments and planning.
(Kay 1993, p. 695)

The Neoliberal Experiment: They've got to do as we tell them! 🇺🇸

 (20/06/17)

Western economic advisers had far greater direct power to influence political behavior in Third World nations, through management of structural adjustment programs, as those nations found themselves unable to handle their accumulated debt ⁵⁹⁹. They were, therefore, able to demand broader changes than could be achieved in Western countries.

They were not slow to exercise their muscle! The demands they made were driven by a belief in the efficacy of 'free markets'; by a strong belief in the power of the marketplace to deliver social welfare; by a belief in the justice of 'user pays' principles of welfare delivery; and, more generally, by the neoliberal ideology which underpinned unregulated capitalism from the 17th century and had been honed in Western thought as a consequence of experiences in the 1920s and 1930s ⁶⁰⁰.

It became inevitable that neoliberal 'development' advisers would argue for the 'privatization' of Third World government agencies and activities. Government should not be involved in the marketplace, so all services and goods supplied by government should be divested to private investors. The only responsibility of government was to ensure safety and equity amongst its populace.

Since neoliberal principles were universally valid, they could be applied wherever governments found themselves in economic difficulty.

... As President Kaunda of Zambia put it, 'The IMF does not care whether you are suffering economic malaria, bilharzia or broken legs. They will always give you quinine'.

The policy prescriptions ... reflect[ed] the Fund's political and economic ideology rather than the interests of the developing countries.
(Cheru 1989, p. 37)

In Western nations, the movement towards privatization resulted in a range of government agencies being sold in order to be operated by private individuals or firms for private profit. ⁶⁰¹

In the Third World, the [consequences of this neoliberal belief](#) in the efficacy of 'market-led recovery' were far more dramatic.

Both the International Monetary Fund and the World Bank developed programs for the reorientation of Third World economies which directly reflected the basic assumptions of the neoliberal belief in the power of private enterprise to kick-start Third World economies. These policies came to be known collectively as 'Structural Adjustment Programs' (SAPs) ⁶⁰².

Governments were fundamentally affected by structural adjustment programs in a number of ways⁶⁰³.

First, the old active involvement in planning and promoting economic development, assumed under previous development regimes, disappeared. The government should now avoid any involvement in planning and promoting economic activity. This should be left to the 'private-sector'.

Second, the government should divest itself of all those areas of service provision which, in the past, had largely been its rationale for existence. Now, those government departments and agencies involved in the delivery of services to the population should be sold to private enterprise. Governments should, in this new climate, distance themselves from service provision.

This policy of privatization originated, as Mitchell and Manning explained, in First World government reorganization:

The contemporary idea of public-private partnerships as an approach to economic development had its origins in American and British public policy during the late 1970s.

Faced with a mushrooming budget deficit and a stagnant economy, the Carter administration tried to curb government spending through the introduction of *zero-based budgeting* and championship of the concept of *privatization*.

The former meant justifying government spending programs each year during the annual budgeting cycle. The latter advocated spinning off feasible programs to the private-sector, where they would be operated on a for-profit basis ...

Both tactics were meant to save the government money, and perhaps make the economy work more efficiently, by broadening the sphere of activity directed by market forces.

(Mitchell & Manning 1991, pp. 45-6)

The emphasis on privatization in the 1980s and 1990s was primarily a movement away from treating individuals as 'citizens' to treating them as 'clients' and 'customers' (see Sharp 1994, p. 4), from seeing the population as members of a co-operative community, to seeing them as competitive, individualized consumers.⁶⁰⁴

Individuals were required to accept the costs of services as individually attributable. Any who required 'subsidization' in order to meet their needs and wants were therefore exposed as 'inefficient,' as a 'cost' on other individuals, as a 'tax burden'.

This movement from community to individual responsibility was based on a definition of all acceptable exchange as competitively balanced and individualized.⁶⁰⁵ Social responsibility had, therefore, to be legislated and 'public watchdogs' appointed to ensure that those who relied on 'subsidies' to make ends meet were not 'cheating' and 'defrauding' the system.

Privatization: the Antidote to Political Opportunism and Corruption

In Third World countries, an implicit purpose of this privatization of service provision was to sever the political connection with revenue raising. This was supposed to reduce the level of political opportunism and corruption associated with service provision and the siphoning of resources from government coffers into political networks.

For some inexplicable reason ⁶⁰⁶, the 'experts' assumed that economic enterprises, if they were made responsible for public welfare, would not engage in such activity.

'Development specialists' considered this to be a *political* problem. In order to reduce political involvement in business organization and activity, it was considered necessary to deregulate private enterprise; to remove the legislative levers which could be manipulated by politicians and their associates to ensure access to revenue from private business.⁶⁰⁷

Once this happened, since transnational companies could now develop their activities within Third World countries with less need for political sponsorship (and with no need to assume a public welfare responsibility for people in the communities in which they operated), business activity quickly passed into the hands of foreign entrepreneurial forces.

Transnational companies have learned, over the past thirty years, to utilise their superior international integration in order to maximize their control within national boundaries ⁶⁰⁸.

Underwrite Private Borrowing: You Can't Lose! 🐉

Not only have neoliberals seen big government as the *bete noire* of development and emphasized privatization of government activity and the [deregulation of private enterprise](#) to counter this, they have also seen such government as responsible for the debt crisis of Third World countries.

Since the late 1970s, First World lenders have remained concerned about [the ability of Third World countries to service debts](#), in part accumulated during the heady days of the 1970s.

During the 1970s, OPEC countries tried to reinvest windfall profits from the rapid rise in oil prices around the world. First World banks, embarrassed by the large amounts of money available for investment, were less than cautious in their lending policies, encouraging Third World governments and private enterprises to borrow heavily on very little security.

Many development advisers believed that the flood of investment finance resulting from the OPEC-led oil price rises, if tapped by Third World enterprises, would ensure rapid industrial development, provided governments agreed to act as guarantors.

Banks and other lending agencies ([including IMF and World Bank officials](#)), seeing this as a way of guaranteeing their investments, strongly backed this claim. They argued that this, 'risk-free', backing was the only way in which enterprises in Third World countries could be assured of investment funding.

They advised governments, therefore, to underwrite private enterprise borrowings, assuring them that future investment returns would not only meet debt repayments but also generate increasing public revenues.

One of the consequences of the flood of money made available to Third World elites through this new inflow of investment funds ⁶⁰⁹ was a rapid inflation in the purchasing power of those who had access to the borrowed money.

As Briones and Zosa described for the Philippines:

The benefits of the debt have long been enjoyed by the governing and favored elite, and they are still reaping the benefits of the current debt management strategy. The masses, on the other hand, bear the

burden of debt service through expenditure cuts in economic and social welfare services in the national budget.

(Briones & Zosa 1994, p. 258)

Third World elites, linked through a range of patron-client relationships, gained access to money borrowed by both government and business interests and were able to use this money to further their own status aspirations. This resulted in an inflation in expectations amongst elites.

In communities where social templates are not primarily based on material accumulation, any inflation in the material requirements of those with status, in time, becomes firmly institutionalized. Once this happens, statused people are locked into those levels of expenditure. If they cannot fund their status requirements they lose credibility and become less useful to those who rely on them for support.

Their clients, therefore, find themselves having to shore up the credibility of their patrons by supplying the necessary funds to ensure their credibility. In Third World countries, once access to foreign funds disappeared, this resulted in a rapid reduction in the material quality of life for those of lower status as they were called on to meet the shortfall.

Rather than the anticipated 'trickle down' effect, assumed to result inevitably from investment of the borrowed funds in productive enterprise and the consequent increase in labor requirements, Third World communities experienced the reverse.

Communities experienced a 'trickle up' effect as patrons sought new avenues of funding for their new needs and clients realized that their patrons were only useful if they could retain their status positions, which required them to contribute to the costs of those needs.

During the 1980s, those Third World governments and private enterprises which had gained access to the windfall funds of the 1970s inevitably found themselves unable to meet debt servicing costs. First World lenders became concerned that they might default on their loans and took steps to ensure that this would not happen ⁶¹⁰.

Debt-Equity Conversion Programs: Swapping the Family Farm! 🐘

During the 1980s, international agencies like the IMF, at the instigation of worried creditors, devised and applied structural adjustment programs to deal with the resultant debt crises in Third World countries. One of the features of these programs was the emphasis placed not only on the privatization of government services, but also on the need to attract foreign direct investment (FDI).

Development experts and First World creditors managed to convince many governments that they could lure investors into Third World countries and, simultaneously, tackle their debt burden. This could be done, they claimed, through the promotion of a variety of debt reduction schemes through which investors could avail themselves of national assets at bargain basement prices.

These 'debt-equity conversion programs' ⁶¹¹ offered foreign investors national assets in exchange for debt write-offs. A favorite target for this kind of deal was the privatization of government assets in the course of structural adjustment programs devised and overseen by the World Bank and the International Monetary Fund.

The schemes involve governments in reducing debts, primarily to commercial banks, in exchange for government assets or for private-sector assets, often bought with discounted local currency. This is best explained through an example.

The following is a debt-equity swap arranged by General Motors in Mexico. The summary comes from the presiding Judge Stephen Swift's summation of a case brought before the US Tax Court by the US Inland Revenue Service against General Motors for understating its gains in the transaction:

In October 1987, G.M. Trading paid \$600,000 to the Nederlandsche Middenstandsbank N.V. Bank (NMB) for \$1.2 million of U. S. dollar-denominated debt guaranteed by the Mexican government, reflecting the prevailing market discount rate of 50% for such debt.

The company incurred \$34,000 in fees as a result of the transaction.

In November 1987, the Mexican Ministry of Finance and Public Credit deposited 1,736,694,000 pesos - equal to \$1,044,000, or \$1.2 million at a 13% discount - into an account established in Procesos' favor.

Procesos then transferred 173,670 shares of its class B stock - one share for every 10,000 pesos or remaining fraction thereof - to the Mexican government, which transferred them to G.M. Trading in exchange for cancellation of the \$1.2 million dollar-denominated debt.

The Internal Revenue Service argued, and the court agreed, that G.M. Trading realized a \$410,000 gain on the debt-equity exchange - the fair-market value of the 1,736,694,000 pesos less its \$634,000 cost of participating in the exchange.

(Zobrist, Wichman, Murai & Ichiki 1992)

As this example illustrates, debt/equity transfers often involved an initial transfer of debts incurred by private enterprises in Third world countries to the government.

The buy-out of Procesos by G.M. Trading was based on an initial Mexican Government bail-out of the company to the tune of \$US1 044 000, for which G.M. Trading paid a total of \$US634 000 in external funds.

It is important to understand why the Mexican Government had to assume Procesos' debt.

Third World governments had been encouraged by both development and banking advisors to underwrite private enterprise borrowings, assuring them that future investment returns would not only meet debt repayments but also generate increasing public revenues.

As private enterprises failed in the 1980s, governments found themselves responsible for their external borrowings.

Short of defaulting on their commitments, there were two principle ways in which Third World governments grappled with the mounting debt burden created by private enterprise failure:

- ★ They could assume responsibility for the debt, and pay it out in local currency through the transfer of resources to transnational companies, as in the above case, or
- ★ they could buy back the debt papers from banks themselves at a fifty per cent discount, though this, of course, usually required further borrowing of 'hard currency' to fund the buy-back - usually at high

interest rates because the credit worthiness of governments facing such difficulties was obviously low.

The result of either practice created new problems for Third World governments ⁶¹².

It is little wonder that political leaders in Third World countries, by the 1990s, were speaking of a new age of colonialism, in which those major assets of Third World countries which were not already foreign owned passed into the hands of transnational companies at bargain-basement prices.

In these arrangements, Third World governments often became partners in public-private partnerships dominated by overseas interests. Those interests invariably argued for further reorganization of national economies along neoliberal lines, decreasing government involvement in economic activity, and further deregulating economic and financial activity.

This, in turn, further [facilitated the free movement of capital and enabled the ready transfer of profits](#) from Third World countries into the rapidly expanding financial markets of the West.

[The Paradox of Increased Production and Decreased Returns](#)

There are a number of important consequences of reorganizing communities in terms of neoliberal principles.

The first is that uninhibited competition will always act to drive down costs and prices. The most successful firm will be the one which is able to lower costs, and therefore lower price, and so gain an edge over rivals in the marketplace.

Over time, this inevitably puts downward pressure on primary commodity prices; on the raw materials of production or the basic production inputs. As those prices decrease, small holdings become non-viable and small-holders are forced to sell and move off the land. The processes of land and resource consolidation and constantly increasing economies of scale result, inevitably, in the movement of people out of the countryside and into the burgeoning slums of Third World towns and cities ⁶¹³.

The consequences are the rural-urban migration phenomenon of the past fifty years and the emergence of a growing population of people who have lost access to subsistence resources and must rely on whatever money they are able to obtain from activity in towns for subsistence. This, in turn, has resulted in large informal economies in most Third World countries ⁶¹⁴.

Formal economic activity will always focus on areas where money is to be made. That is, by definition, production will continue to expand until it is surplus to requirements. Western economies are premised upon a supply *glut*, not on supply *scarcity*.

This feature, in a truly 'free' and 'unregulated' market, in combination with the consequences outlined above, results in the stimulation of production at ever reduced cost. Once an individual or firm has invested capital in production, it is often difficult in the real world to diversify. So, the only way to maintain income as prices are being driven down is to increase production.

This results in a paradox.

The less profitable that production becomes, the greater the effort to increase production to compensate for falling returns through increased sales. Until, of course, the firm or individual can no longer compete and the business collapses.

The consequences of this are, of course, that constantly increasing demands are made of the environment. At the very time when those involved are *least able* to afford the costs of environmental protection, they are being forced into expanded utilization of the resources available to them.

Under such circumstances, relatively costly conservation programs are beyond the means of those whose activity is most likely to result in long-term environmental degradation. This has, in many Third World countries, resulted in [looming environmental disaster](#).

As long as there is money to be made from an activity, the number of producers will continue to multiply and the exploitation of resources will continue to expand until they are in short supply. That is, economic activity becomes premised on a *scarcity of resources*. As resources become scarce, people, inevitably, utilise those which are only marginally productive.

This process has been compounded in Third World countries through the expropriation of resources for capitalist development ⁶¹⁵.

While resources are available, the number of suppliers and the volume of production will continue to expand until production exceeds the requirements of the marketplace. This has been an experience shared by most Third World communities over the past fifty years.

What starts as a specialised product for a niche market, becomes the flavor of development programs as word passes from one aid organization to another. Before long, the market has been saturated and the investment made in necessary infrastructure becomes added to the debt load of the country.

[Economies of Scale and Impoverishment of Small Producers](#)

In almost all cases, the number of suppliers greatly exceeds the number of buyers, the market forces competition upon suppliers, forcing down prices until returns on production are marginal. At that point, and not before then, production stops expanding. With production marginally in excess of market requirements, producers remain in competition and economic success depends on reorganization of production to trim costs.

Those producers who do not reorganize production, or do so less effectively, become uncompetitive and drop out of production. This, over time, leads to economies of scale so that small producers find themselves unable to compete with large producers.

As the size of productive enterprises grows, the sophistication of production also increases as producers look for new ways of cutting costs, leading to increased use of machinery and other forms of cost-reducing and production-increasing technology. As this happens, the capital requirements of being involved in production escalate, making it less likely that newcomers can successfully enter into the marketplace to challenge the dominance of the large players.

Many Third World countries, in trying to develop viable industrial sectors, have found themselves in just this position in relation to already industrialized countries.

With the emergence of Just-In-Time production processes ⁶¹⁶, they become relegated to the position of suppliers of cheap labor until the industries which have relocated to take advantage of that resource re-tool with emerging technology and relocate nearer their major markets (or take advantage of the lower costs offered elsewhere through [hyperglobalization](#)). Consequently, in attempts to attract and then retain industry to their regions, [governments find themselves having to offer greater and greater incentives](#), sometimes supplying most of the necessary infrastructural supports, in order to lure companies to relocate.

Of course, the smaller the necessary investment in establishing a factory, the easier it is for the business to relocate elsewhere in pursuit of cheaper labor or more attractive inducements. Third World governments find themselves subsidising transnational corporations in order to ensure that they locate and remain in their countries.

At times, returns to Third World countries barely cover their outlays in attracting and retaining transnational corporate investment ⁶¹⁷.

Since only those producers who are able to respond to market forces will survive, those who find themselves no longer able to economically compete in a particular product area will, if they are to remain economically viable, have to find other products for which there remains a strong demand. That is, they will have to diversify.

Long-term economic success in the Western marketplace requires access to, and understanding of, the emerging technologies for reducing costs and increasing production and/ or sufficient grasp of market realities to be able to predict future demand and gear production to that prediction.

In the real world, of course, few small operators are able to rapidly change from one form of production to another as the market becomes saturated. This kind of rapid response to market demand requires sophisticated technologies, organization and information ⁶¹⁸.

Small producers do not have access to the necessary information, technology and organizational expertise and so are unable to successfully compete with transnational companies. Instead, as profitability drops, production tends to expand until the cash reserves of producers are expended and they have been driven into debt. Then, already in debt, they are forced out of production.

There is little possibility of diversifying into more profitable forms of production since that would require capital and they have already used their surplus in a vain attempt to remain viable in the current form of production. This scenario is played out all over the world as product supply to the market reaches saturation levels.

Since the aim of production is to make money, the only way in which a producer can ensure that he or she remains in a profitable venture, other than through cutting costs and increasing production, is through cornering the necessary resources for that production, that is through gaining a monopoly in an area of production. This is seldom possible in primary production, and Western nations have laws limiting the possibility of monopoly control of production since it is well understood that cartel price-fixing arrangements, or the cornering of a market by a single producer, limits the possibilities of production and therefore erodes the efficiency of the marketplace.

The inevitable end result of this play of market forces is not increased well-being for small producers, but marginal subsistence. Only those producers which are prepared to lower prices until they can just survive will remain. All others will lose market share.

The Sweat Shop is the Destination - unless you're protected! 🇺🇸

 (19/01/17)

In a deregulated world, the sweat shop is not a step on the road to 'economic development', it is the destination of most Third World people who aspire to Western-style economic development.

Western economic forces, given free rein, lead to people living lives of borderline starvation, of endemic poverty, with the few who control access to finance and resources, or who can become involved in international corporate activity, able to maintain wealthy lifestyles ⁶¹⁹.

One of the important reasons why Western nations introduced baseline wage rates through the last part of the 19th and the 20th centuries has been because without them market forces would have reduced the bulk of the population to this level. Now, through deregulating national economies and universalizing competition, those countries which decide to retain basic wage rates find themselves unable to compete in labor-intensive production with countries which do not have basic wage rates.

Inevitably, therefore, those who are ideologically committed to allowing market forces free play argue that it is 'rational' to remove basic rates. But rational for whom? If the consequences of allowing market forces free rein is the long-term impoverishment of the majority of the population then what is rational in terms of the marketplace becomes irrational in terms of the long-term well-being of communities of people.

The presumption that there is an 'unseen hand' ensuring that what is good for the marketplace is good for society is an ideological one. It is not based upon a rational assessment of the long-term results of organizing society to serve the marketplace. Rather, it is based upon an historical argument which certain sections of Western European communities used in justifying a break with feudalism and a loosening of government restrictions on profit making ⁶²⁰.

The organization of society to serve the marketplace was not to the advantage of the majority of people in the 18th or 19th centuries. Its success for Western nations during the 20th century and to the present has been based upon privileged access to the resources of the world and low-cost primary production to an expanding world market.

 (21/02/16)

The last three decades have ushered Western communities into a 'new world order'. Western nations have accepted the arguments of neoliberal economics that in order to ensure 'economic efficiency', national economies need to be deregulated and opened to worldwide competition.

Of course, the arguments are logically impeccable, given the forces now driving international economic organization and activity. In a deregulated world, those communities which don't deregulate cannot compete in the international marketplace⁶²¹. But the reason they can't compete is that they have retained those minimum standards of well-being which were set in place during times of economic protection and regulation.

Conglomerates and the Progressive modernization of Poverty 🐦

📅 (22/01/16) (16/06/17) (23/01/18) (02/02/18) (07/07/18) (23/09/18) (20/11/18)"(06/02/20)
(11/02/19) (19/02/19) (04/10/20) (12/11/22)

Internationalized business has become globalized, consolidated into insulated, self-sustaining conglomerates⁶²² and increasingly profitable. Those conglomerates might operate within a globalized 'free market', but they manage to contrive either monopoly or cartel conditions for themselves wherever they operate.⁶²³

Nothing sums up the sad reality better than Davos. The super-rich gather to congratulate themselves on their 'achievements'⁶²⁴ and Western politicians join in the partying. As the 2018 Oxfam report, prepared for the party, has put it:

Last year saw the biggest increase in the number of billionaires in history, with one more billionaire every two days. There are now 2,043 dollar billionaires worldwide. ...Billionaires also saw a huge increase in their wealth, enough to end extreme poverty seven times over. 82% of all of the growth in global wealth in the last year went to the top 1%, whereas nothing went to the bottom 50%.

...All over the world, our economy of the 1% is built on the backs of low paid workers ...who are paid poverty wages and denied basic rights.

(^œOxfam Briefing Paper - January 2018)

In the 3rd decade of the 21st century, Western democracies have been **bought and paid for** by mega-wealth. The most loudly proclaimed and aggressively self-promoting of them, the United States of America, leads the way. The website ^œ[OpenSecrets.org](https://www.opensecrets.org) has summed it up:

It's official: the 2018 election was the most expensive midterm ever by a large margin, with total spending surpassing \$5.7 billion, according to data compiled by the Center for Responsive Politics.

The final tally surpasses the conservative \$5.2 billion projection the Center released in October.

With more than \$5.7 billion shelled out by candidates, parties, committees, PACs and outside groups, the 2018 midterm leapfrogs even the then-record breaking 2008 presidential election which saw nearly \$5.3 billion in total spending. It also smashes the previous midterm spending record of \$3.8 billion in 2014.

"Just as the 2018 elections brought historic wins for a more diverse group of candidates, they also saw greater spending than we've ever seen or anticipated for a midterm election, capitalizing on years of loosened campaign finance regulation and oversight," said Sheila Krumholz, executive director of the Center for Responsive Politics.

(OpenSecrets.org, ^œ[Most expensive midterm ever: Cost of 2018 election surpasses \\$5.7 billion](https://www.opensecrets.org/news/2019/02/most-expensive-midterm-ever-cost-of-2018-election-surpasses-57-billion/), OpenSecrets News, February 6, 2019)

Newly elected US Representative Alexandria Ocasio-Cortez, in a refreshingly clear style, put the problem in a nutshell. As she explained:

We have a system that is fundamentally broken... It's already super legal.. for me to be a pretty bad guy... [I]t's even easier for the President of the United States to be one...

(NowThis News, ^œ[Alexandria Ocasio-Cortez Exposes the Problem of Dark Money in Politics](https://www.youtube.com/watch?v=KwZuWwvXp0k), YouTube Video, Feb 8, 2019)

A report, prepared by the Corporate Europe Observatory (CEO), 'a research and campaign group working to expose and challenge the privileged access and influence enjoyed by corporations and their lobby groups in EU policy making', explains the problem in the European Union ⁶²⁵:

The member states of the European Union are intimately involved in, and responsible for, the EU's laws and policies. This report focuses on the democratic deficit that sees too many member states, on too many issues, become captured states, allowing corporate interests to malignly influence the decisions they take on EU matters. Instead of acting in the public interest of their citizens and those in the wider EU, they often operate as channels of corporate influence.

(Corporate Europe Observatory, ^œ[Captured states: when EU governments are a channel for corporate interests](#), Executive Summary, February 6, 2019)

Abraham Lincoln, in 1864, spelt out the problem:

As a result of the war, corporations have been enthroned and an era of corruption in high places will follow, and the money power of the country will endeavor to prolong its reign by working upon the prejudices of the people until all wealth is aggregated in a few hands and the Republic is destroyed.

([Abraham Lincoln to \(Col.\) William F. Elkins](#), Nov. 21, 1864)

Walter Mead summed up the US post-Lincoln 'Robber-Baron' years:

The years between the assassination of President Abraham Lincoln, in 1865, and that of President William McKinley, in 1901, were among the least inspiring in the history of U.S. politics. As Reconstruction proved unsuccessful and a series of devastating depressions and panics roiled the economy, Washington failed miserably to rise to the challenges of the day.

Not many Americans can name the drab presidents who drifted ineffectually through the corridors of the White House during those years; fewer still know the names of the senators and representatives with whom they worked. Almost no one not professionally engaged in the study of U.S. foreign policy can remember a diplomatic accomplishment between the purchase of Alaska and the construction of the Panama Canal. When the politicians of those days are dimly remembered, it is more often for scandal ("Ma, Ma, where's my Pa?" went the campaign chant referring to President Grover Cleveland's illegitimate child) than for any substantive accomplishment.

But if these were disappointing years in the annals of American governance, they were years of extraordinary importance in American history. This was the period in which the United States became the largest and most advanced economy in the world. As transcontinental railroads created a national market and massive industrial development created new industries and new technologies, astonishing inventions poured out steadily from the workshops of Thomas Edison and his imitators and rivals. John D. Rockefeller turned petroleum from a substance of no commercial importance into the foundation of global economic development. The United States' financial system became as sophisticated and powerful as that of the United Kingdom.

In hindsight, it was a period in which the United States failed its way to success as the consequences of the Industrial Revolution made themselves felt....

(Walter Russell Mead, ^œ[The Big Shift: How American Democracy Fails Its Way to Success](#), *Foreign Affairs*, May/June 2018)

But, as Clare Fader put it, "Compared with these finance guys, the [robber barons of the past](#) look like Johnny Appleseed" (in a letter to the *New Yorker* editor commenting on 2020 'investors' profiting at the expense of Western citizenry described in an article entitled '^œ[The Price of the Coronavirus Pandemic](#)' (April 13, 2020)) (^œ[May 04, 2020](#)).⁶²⁶

Aaron Gregg, in 2018, described the intermeshing of US military and industrial interests, staffing and directorships:

..Almost two years after Donald Trump came to Washington pledging to "drain the swamp" of special interests and clear waste from the Pentagon's supply chain, a steady stream of retired generals, admirals and government procurement officers are still accepting lucrative positions with companies that do business with the military.

A report released Monday by the advocacy group Project on Government Oversight (POGO) found that major U.S. defense contractors have hired hundreds of former high-level government officials in recent years, including at least 50 since Trump became president. The report lends new visibility to long-standing concerns about a revolving door between the government agencies that award major contracts for military supplies and services and the businesses that profit from those contracts.

Corporate influence in Washington was a campaign trail rallying point for Trump, who said soon after the 2016 election that there should be a "lifetime restriction" on top defense officials going to work for defense contractors. "The people that are making these deals for the government, they should never be allowed to go work for those companies," he said on Fox News Channel.

In early 2017, Trump signed an executive order imposing a five-year ban on administration officials lobbying agencies in which they have served and a lifetime ban on lobbying for foreign governments. But Washington Post fact-checker Glenn Kessler noted that Trump has weakened lobbying restrictions put in place by previous presidents.

Although it is hard to say whether revolving-door activity has increased or decreased during the Trump presidency, it is clear that defense firms are still eager to hire those with high-level military experience.

POGO identified 645 instances in the past 10 years in which a retired senior official, member of Congress or senior legislative staff member became employed as a registered lobbyist, board member or business executive at a major government contractor. It counted many more "instances" of revolving-door hires than actual people because some retired officials had stints with multiple companies during their post-military careers.

(Aaron Gregg , ^œ[Almost two years into Trump presidency, Pentagon's revolving door still spins](#), *The Washington Post*, November 6, 2018)

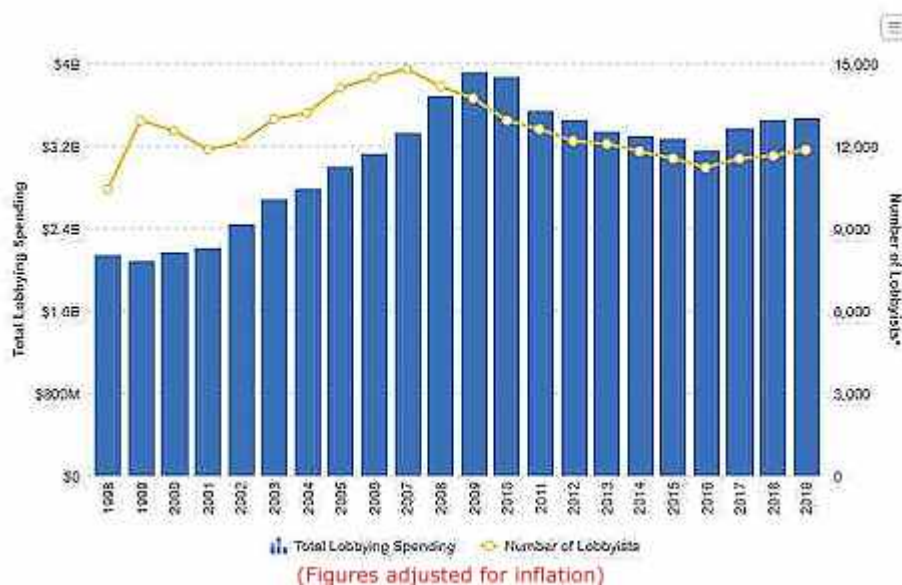

Among the major findings of the US ^œ[Project on Government Oversight](#) report:

- There were 645 instances of the top 20 defense contractors in fiscal year 2016 hiring former senior government officials, military officers, Members of Congress, and senior legislative staff as lobbyists, board members, or senior executives in 2018 (see chart

below). Since some lobbyists work for multiple defense contractors, there are more instances than officials.

- Of those instances, nearly 90 percent became registered lobbyists, where the operational skill is influence-peddling. At least 380 high-ranking Department of Defense officials and military officers shifted into the private sector to become lobbyists, board members, executives, or consultants for defense contractors.
- Of the Department of Defense officials POGO tracked through the revolving door, a quarter of them (95) went to work at the Department of Defense's top 5 contractors (Lockheed Martin, Boeing, Raytheon, General Dynamics, and Northrop Grumman).
- Military officers going through the revolving door included 25 Generals, 9 Admirals, 43 Lieutenant Generals, and 23 Vice Admirals.

The website ^{oe}[OpenSecrets.org](https://www.opensecrets.org) has provided a summary of lobbying activities within the US between 1998 and 2019, both by home-grown: ^{oe}[Lobbying Data Summary](#) and foreign: ^{oe}[Foreign Lobby Watch](#) lobbyists.

NOTE: Figures... are calculations by the Center for Responsive Politics based on data from the Senate Office of Public Records. Data for the most recent year was downloaded on January 23, 2020 and includes spending from January 1 - December 31. Prior years include spending from January through December.

In 2022 the privatization of US state and federal elections has continued apace. As an *Open Secrets* headline proclaimed: "Total cost of 2022 state and federal elections projected to exceed \$16.7 billion".

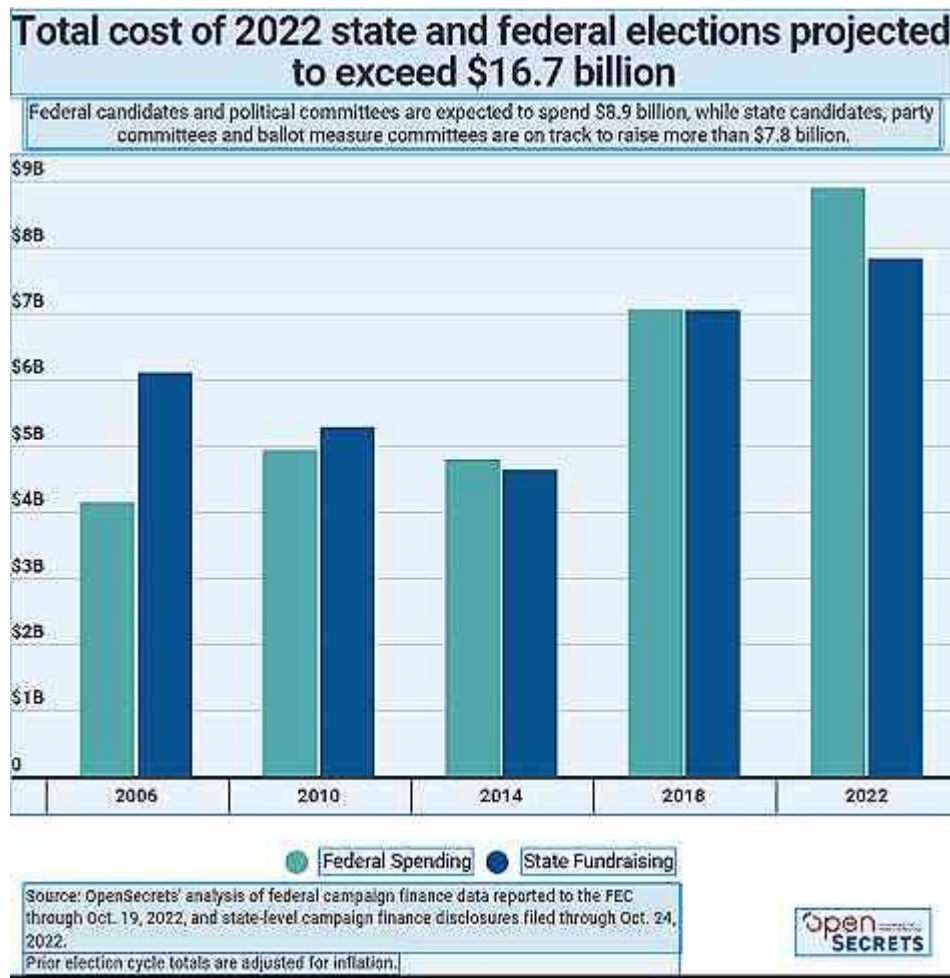

All is well in the United States! Federal and State politicians have been [bought and paid for](#) and it's 'steady as she goes' for the Ship of State!.

Voters debate the 'reasons' for the 'unexpectedly' close election results and commentators pontificate on the 'success' and 'failure' of 'Democrat' and 'Republican' strategies, but surprisingly few focus on a far more important story: cost of the 2022 'mid-terms' has exceeded the previous high-water mark of 2018!

As Taylor Giorno and Pete Quist explain:

The total cost of 2022 state and federal midterm elections is projected to exceed \$16.7 billion, according to a new OpenSecrets analysis. Federal candidates and political committees are expected to spend \$8.9 billion, while state candidates, party committees and ballot measure committees are on track to raise \$7.8 billion.

Election-related spending at the federal level has already blown past the inflation-adjusted 2018 midterm record of \$7.1 billion. State-level candidate, party committee and ballot measure committee expenditures could surpass the estimated 2018 midterm spending record of \$6.6 billion, adjusted for inflation.

(Taylor Giorno and Pete Quist, [Total cost of 2022 state and federal elections projected to exceed \\$16.7 billion](#), *Open Secrets*, November 03, 2022)

In countries around the world, corporations gain the cooperation of political players and government officials, blurring the boundaries between the 'public' and 'private' realms. While neoliberal economists and fellow travelers have insisted that "governments should not be involved in economic enterprise", there has been little protest about the involvement of major corporations in government. Economic enterprises have become major players in governments around the world.

Haris Tabakovic and Thomas Wollmann have investigated and described the behaviors and motivations of regulatory agency employees in the United States over the past half century. As they explain,

Many regulatory agency employees follow brief, public sector experience with more lucrative work at the firms they used to regulate. In several industries, the practice is so common that these agencies

appear to have "revolving doors." This may begin with - and partly be motivated by - firms' desires to hire workers with agency experience. The concern, however, is that it leads to a *quid pro quo*: lax supervision is exchanged for future employment.

Whether explicit or tacit, this arrangement can have first order welfare consequences stemming from policies that are ineffective at correcting market failures and unmotivated to protect the public interest....

Despite this concern, there is no empirical work studying individual public-to-private sector transitions among regulatory agency employees *at the decision level*.

(Haris Tabakovic and Thomas Wollmann, ^œ[From Revolving Doors to Regulatory Capture? Evidence from Patent Examiners](#), April 2, 2018 (published by the *National Bureau of Economic Research*: NBER Working Paper No. 24638, Issued in May 2018))

^œ[Creswell and White \(2008\)](#), in an article in the *New York Times*, provided a description of the kinds of blurring which occur. As they explained,

The power and influence that Goldman wields at the nexus of politics and finance is no accident. Long regarded as the savviest and most admired firm among the ranks - now decimated - of Wall Street investment banks, it has a history and culture of encouraging its partners to take leadership roles in public service ⁶²⁷.

The interconnections they describe are not unique to Goldman Sachs. Corporations everywhere, attempt to institute similar relationships with government and political partners.

Praful Bidwai (2010) claims that in India,

Washington-style practices of corporate lobbying have crept up on New Delhi politics, subverting the policy-making process to meet the profit imperatives of private corporations. The new trend of corporate lobbying in India presents a real and serious threat to democracy.

...Lobbyists have come to acquire enormous clout, to the point of influencing the choice of Cabinet minister, nominating key bureaucrats, and formulating economic and industrial policies at the nuts-and-bolts level.

(^œ[Bidwai May 2010](#))

The *Center for Responsive Politics* has provided an in-depth examination of lobbying in the United States between 1998 and 2018. In an introduction to their ^œ[Lobbying Database](#), they summarize:

In addition to campaign contributions to elected officials and candidates, companies, labor unions, and other organizations spend billions of dollars each year to lobby Congress and federal agencies. Some special interests retain lobbying firms, many of them located along Washington's legendary K Street; others have lobbyists working in-house. We've got totals spent on lobbying, beginning in 1998, for everyone from AAI Corp. to Zurich Financial. (See also: ^œ[Foreign Lobby Watch](#).)

Of course, corporate lobbying is the tip of an iceberg. As Creswell and White (2008) explained for Goldman Sachs,

It is a widely held view within the bank that no matter how much money you pile up, you are not a true Goldman star until you make your mark in the political sphere.

There is an interchange of personnel between government agencies and private corporations as individuals supply expertise and networking links to both through short term contract activities. At times it can be difficult to distinguish between corporate and government staffing as people move between public and private organizations - usually justified as 'selecting the best people for the job'.

For these corporations, competition can be controlled by internal corporate protections; by limiting business interaction and promotion to those which are included under a common corporate umbrella; and by securing favorable business-government relations for themselves at the expense of possible competitors. This provides them with a powerful platform from which to negotiate favorable terms of trade with both Western and Third World governments and communities.

Protective regulation for populations has been weakened or removed within national boundaries, leaving communities and individuals open to free market exploitation. To take advantage of the new conditions, international corporations, using their extensive legal and political expertise and connections, have invented their own forms of protective insulation from the impoverishing effects of internationalized 'free competition'.

It is scarcely surprising that, to maintain their contrived advantage, they will continue to vociferously denounce public regulation of economic activity as contrary to the spirit of 'free markets'. The markets are only truly 'free', however, for those who cannot insulate themselves from its effects in similar ways.

In the long run, in a deregulated worldwide economy, the only winners are those who can insulate themselves from its consequences: those who can, through various subterfuges, gain and maintain monopoly or cartel-like control of business transactions. For the rest, since costs are always driven down, and prices are similarly adjusted to the margins, the logical outcome of allowing market forces free play is that businesses become uncompetitive or marginally profitable. ^œIglesias and de Almeida (2011 p. 1,3) explained why:

Many recent models of trade dynamics use the simple idea of wealth exchanges among economic agents in order to obtain a stable or equilibrium distribution of wealth among the agents. In particular, a plain analogy compares the wealth in a society with the energy in a physical system, and the trade between agents to the energy exchange between molecules during collisions.

In physical systems, the energy exchange among molecules leads to a state of equipartition of the energy and to an equilibrium situation where the entropy is a maximum.

On the other hand, in the majority of exchange models, the system converges to a very unequal condensed state, where one or a few agents concentrate all the wealth of the society while the wide majority of agents shares zero or almost zero fraction of the wealth. So, in those economic systems a minimum entropy state is attained.

....a frequent outcome in [free market] models is *condensation*, i.e. concentration of all available wealth in just one or a few agents. This final state corresponds to a kind of equipartition of poverty: All agents (except for a set of zero measure) possess zero wealth while one, or a few ones, concentrate all available resources.

(See [An inevitable concentration of wealth and stalling of market exchange](#) for more on this).

There seems to be a force at work in the 'free' marketplace, driving down production costs and prices and, in the process, reducing the bulk of people involved in small-scale production to penury.

As Paul Burkett described of the 1980s:

The severe economic crisis experienced in most of the periphery in the 1980s is shown by World Bank data. During the 1980-88 period, the average annual growth rate of real per capita gross domestic product (GDP) in the countries of Sub-Saharan Africa (excluding South Africa) was -2.4 per cent. For Latin America and the Caribbean, per capita GDP growth averaged -0.7 per cent.

Overall, per capita GDP shrank at an average annual rate of -0.8 per cent in the countries that the World Bank classifies as 'low-income' (excluding China and India).
(Burkett 1991, p. 475)

Burkett asked why centuries

...of production for the world market left the majority of Third World people with appallingly low living standards?

and concluded:

One answer is that it is the global capitalist economy that *itself* reproduces underdevelopment and poverty in the Third World.
(1991, p. 477)

Over the past thirty years, the world has become aware of a growing population of destitute people living not only in Third World slums and areas of rural depression, but also in First World cities ⁶²⁸.

The implementation of structural adjustment programs in Third World countries seems to have resulted in a process of patterned disorder. People have lost access to subsistence resource bases, communities have been disrupted, poverty has become endemic in many areas of the Third World, and the disparity between the rich and the poor has grown more pronounced in both Third World and industrialized countries.

For many people in Third World countries, [globalization seems like a conspiracy of the rich](#) and economically powerful [against the poor and defenceless](#). As Marjorie Mbilinyi, author of *Big Slavery: The Crisis of Women's Employment and Incomes in Tanzania* (1991), said in an interview at the University of Guelph:

We could have a lot of despair in Africa right now. Many of us see this as a moment of mass genocide. And it's a very conscious one, we think, on the side of at least some big government actors as well as some of the actors in agencies like the World Bank and the IMF.

The peoples of Africa are being steadily impoverished. They are also being dispossessed of their lands.

Governments like Tanzania, partly in response to popular demand, had begun to nationalize assets and try to guide the economy in the direction that would meet the basic needs of the people and increase national control and make it more inward oriented. Now we have complete reversal so that it is almost worse than in the colonial period.
(Mbilinyi 1994)

Fantu Cheru claimed of African experience:

The overwhelming consensus among the poor in Africa today is that development, over the past 25 years, has been an instrument of social control. For these people, development has always meant the progressive modernization of their poverty.

The absence of freedom, the sacrifice of culture, the loss of solidarity and self reliance which I personally observed and experienced in many African countries, including my own, explains why a growing number of poor Africans beg: please do not develop us!
(Cheru 1989, p. 20)

Conclusion 🐦

★ Nearly one billion people alive today - one in every six human beings - are slum dwellers, and that number is likely to double in the next thirty years, according to UN-HABITAT's new publication *The Challenge of Slums: Global Report on Human Settlements 2003*.

Unprecedented urban growth in the face of increasing poverty and social inequality, and a predicted increase in the number of people living in slums (to about 2 billion by 2030), mean that the United Nations Millennium Development goal to improve the lives of at least 100 million slum dwellers by 2020 should be considered the absolute bare minimum that the international community should aim for, according to the report to be released in October 2003.

The locus of poverty is moving from the countryside to cities, in a process now recognized as the "urbanization of poverty." The absolute number of poor and undernourished in urban areas is increasing, as are the numbers of urban poor who suffer from malnutrition, say the report's authors.

(⁶²⁹UN - HABITAT: [Twenty First Session of the Governing Council](#), 16 - 20 April 2007, Nairobi, Kenya)

There are strong international pressures for the deregulation of economic activity within national borders and for the lowering of tariff barriers and other forms of restrictive import and export regulations.

International business is becoming truly independent of national governments and increasingly able to play countries and regions off against each other in negotiating investment terms. And, in the process, is increasingly able to escape responsibility for funding social welfare needs of the communities within which it operates.

(See: Louise Story, [As Companies Seek Tax Deals, Governments Pay High Price](#) (*New York Times*, December 1, 2012) for more on this.)

In efforts to limit the effects of this internationalization, there have been a number of bilateral and regional trade agreements and organizations established ⁶²⁹. They have attempted to mimic the conglomerate organization of international business, trying to gain the advantages of internationalization while maintaining some control over regional economic activity. In large measure, however, they provide further support to transnational economic activity and provide little regulation.

It has been said before ⁶³⁰, but bears reiteration:

Nation-states, once firmly in control of economic activity within their borders are, in a deregulated, privatized world, decreasingly able to shield

their populations from the exploitative consequences of unregulated and internationalized market exchange. Those countries with few bargaining counters become those most vulnerable to demands by transnational business for ever more favorable conditions of trade and access to their resources.

For many people in Third World countries, the free-market economic order is one in which they have lost what power they once had to control their own destinies. They do not even have the recourse of the colonial past to appeal to the colonizing power to limit exploitation within their regions.

Now, there is no international forum capable of limiting and directing the bargaining advantages of business conglomerates whose holdings and turnover eclipse those of the countries with which they do business.

No longer is the economy the means by which communities meet their needs and wants. Now communities service an internationalized economy which need accept no reciprocal responsibilities for their welfare.

chapter 10: 🚩

The Nature and Importance of Public and Private Credit Only Believe...

Introduction

The Distinction between Democratic and Plutocratic Organization;

- The Importance of Public Control of Private Credit Creation
 - What are Central Reserve Authorities?
 - The Nature of Government Bonds or 'Debt Securities'
 - US 'Debt Securities' *must* be bought on 'The Open Market'

How Democratic Capitalist Governments Generate Credit (and *manage perceptions* of economic stability)

- The management of perceived credit stability
- Only Believe...
- How credit is generated

The Relation Between Government Debt and Private Wealth

- Regulation of Private Credit Creation
- Governments Bail Out Big Banks

Blowing Bubbles

- Wolves and Sheep

The Nature of Taxation in Democratic Capitalist Nations

Taxing the Superrich: It is past time to Re-empower communities

Conclusion

Introduction 🚩

📅 (15/05/16)(15/06/16) (08/08/16) (06/01/16)(16/06/16) (14/03/16)(01/06/18) (05/01/16) (20/07/21)
(31/10/21) (19/04/23) (16/07/23) (18/07/23) (23/09/24)

There is an old Evangelical song my mother taught me as a small child. She told me that it was very important to understand its meaning:

Only believe, only believe, all things are possible - only believe!
(Referring to a remark made by Jesus: Mark Ch.9 V.23)

This topic ⁶³¹ demonstrates the efficacy of that song's message in a capitalist world: a world shaped by, and shaping, *deeply held* and *historically forged* ideologies.

Let's start this discussion by stipulating that capitalism runs on 'credit': the reification of a particular form of value - '*exchange value*'.

Credit is the unitized, quantifiable reification of a particular form of value *believed to exist* within commoditized objects - legitimized independently of commodities, through a process of tokenization (it's real because we 'know' it's real and we know that it's real because it is tokenized - which is why economic literature very often seems to confuse the terms 'credit' and 'money' (*tokenized credit*)).

As Carl Wennerlind (2013) explained:

Credit, as is often forgotten, is nothing more than belief, confidence and imagination. If enough people believe that a certain amount of value will be generated in the future or in a distant place, that value

can be used today, either for consumption, investment or debt restructuring. It is this capacity to transfer [*presumed*] value through time and space that gives credit an appearance of magic.

The objective, in capitalist societies, is to accumulate 'credit' and to enjoy the privileges which the possession and exchange of credit can secure.

As explained elsewhere, we, in Western communities, [live in a commoditized world](#). The Western need to accumulate credit inevitably results in more and more of the forms of activity, interaction and organization which people perceive as important to themselves, being exploited for 'profit' or, as Adam Smith put it, "[the acquisition of fortune](#)".

With credit creation no longer legitimized by tying it to the putative value of gold or some other commodity⁶³², it can, at last, be recognized for what it always has been: credit creation '[out of thin air](#)'.

In 2023, there has been an increasing belief in the importance of 'gold-backed' sovereign currencies to 'legitimize' those currencies in bilateral credit swaps and in cross-nation local-currency financial transactions⁶³³. This, of course, sets limits on a sovereign government's ability to manage its own fiat currency based economy, tying it to the availability of 'gold'.⁶³⁴

Nothing is gained by pegging sovereign national currencies to the 'value' of their 'gold reserves' or to the value of any other 'commodity'. Gold has no esoteric mystical property which privileges it over any other commodity, 'basket of currencies' or anything else.

The belief that this legitimizes and strengthens national currencies is false. What it actually does is make *any credit system* which is 'backed by gold' of equal standing, whether managed by a sovereign government or private entities. As we have seen, the use of 'the gold standard' always resulted in fictitious currency legitimization. The original 'gold standard' was what ultimately enabled the United States Dollar to become the *de facto* setter of currency values for those 'gold standard' nations.

Beardsley Ruml, Chairman of the Federal Reserve Bank of New York (1941-1946), spelt out what the fiat nature of a currency meant ([or could mean](#)) for the United States (and any other democratically organized capitalist nation with a similar central banking system):

The United States is a national state which has a central banking system, the Federal Reserve System, and whose currency, for domestic purposes, is not convertible into any commodity. It follows that our Federal Government has final freedom from the money market in meeting its financial requirements.

(Beardsley Ruml, '[Taxes For Revenue Are Obsolete](#)', *American Affairs*, January 1946;

See '[What Taxes are Really For](#)' for more on this.)

At the start of the 21st century there are two competing systems of governance, each with its own set of presumptions as to the primary source of legitimately created credit⁶³⁵:

- In *democratically organized* capitalist societies, credit originates in the public realm. Sovereign governments⁶³⁶ establish and maintain central banking systems which manage and regulate credit supply and are able, as necessary, to create credit 'out of thin air'⁶³⁷. Private banks, which are prone to create credit of their own, are

responsible to central banks and subject to public oversight and regulation.

➤ (12/03/16) In *laissez faire* (that is, plutocratically organized) capitalist societies, [it is believed](#) that all credit originates (or should originate) in 'private money markets'. Private banks create credit 'out of thin air'.

(Though a surprising number of devotees to this view of the world also subscribe to the "[intermediation of loanable funds](#) (ILF) model of banking" fallacy.⁶³⁸)

Governments in need of credit should borrow what they need from private money markets. Central banks should be independent entities, responsible and responsive to private money markets⁶³⁹. Governments should, in economic matters, be subservient to the marketplace and any attempt at regulation is a move to economic inefficiency⁶⁴⁰.

Fiscal policy is the devil - Walk this way and I will provide you with a loan instead!

Robert Skidelsky, addressing the role of the central bank in Britain, explained the [necessary subordination of the central bank](#) (and of course all other government administrative departments and institutions) to political policy and decision making:

In his March budget, the United Kingdom's chancellor of the exchequer, Rishi Sunak, enlarged the mandate of the Bank of England to include supporting the government's target of achieving net-zero greenhouse-gas emissions by 2050. But in a June 8 letter to the *Financial Times*, Mervyn King, a former BOE governor, was sharply critical of the move. King warned that "an expansion of central bank mandates into political areas such as climate change [...] threaten[s] to weaken de facto central bank independence, leading to a slow response to signs of higher inflation." So, what is going on?⁶⁴¹

Simon Johnson has explained the post 1970s transition from democratically organized capitalist societies to *laissez faire* (that is, plutocratically organized) capitalist societies and the consequences of that shift for control of financial regulation in the United States:

President Donald Trump has a broad deregulation agenda, supported by House and Senate Republicans. Most of the key powers to regulate finance have already been delegated to the Federal Reserve - ironically by the Dodd-Frank legislation itself. And the president appoints the people who have complete control over regulation at the Fed. This is a dangerous combination.

Trump... knows very well what he wants with regard to the relationship between government and business: he wants the government to stop telling business what to do. On this issue, the president stands in a direct line of ideological descent from Ronald Reagan, who strongly believed that government was the problem.⁶⁴²

As Western nations, seemingly inevitably, dismantle their New-Deal-inspired legislation which placed control of credit creation firmly within the public arena, they are losing control of credit creation and regulation and [becoming subservient to internationalized plutocratic forces](#). As they transition from democratic to plutocratic forms of governance the institutions and processes set in place during the New Deal period (roughly

the mid-1930s to early 1970s) are increasingly being warped to reflect *laissez faire* requirements⁶⁴³.

So, in capitalist societies, there are (potentially) *two primary sources of legitimately created credit*: Sovereign Governments (the *Public* realm - issuing unencumbered sovereign credit) and *Private* Banks (issuing encumbered credit): two entities which can conjure credit from '*thin air*' (see James Galbraith (2010)).

In Western capitalist societies there has long been a divide between those who believe that all credit is created within the private marketplace, without government interference (*Laissez-faire* economic activity - or 'free market fundamentalism', *leading, inevitably, to plutocracy*); and those who believe that in democratically organized capitalist societies private economic activity *presupposes sovereign credit and currency creation* and oversight in the 'public' (or 'government') realm.

The Distinction between Democratic and Plutocratic Organization

 (31/01/16) (19/07/16) (01/01/17) (27/03/17) (13/07/17) (29/06/17) (09/05/18) (23/03/17) (07/07/19) (18/03/20) (21/03/20) (10/04/20) (14/04/20) (15/04/20) (20/04/20) (21/04/20) (07/08/20) (08/12/20) (21/12/20) (23/12/20) (13/04/21) (27/05/21) (24/07/21) (29/07/21) (21/12/21) (27/01/16) (11/06/17)

There can be no true democracy where political aspirants must raise vast sums of money to fund campaigns. Whatever the initial motivations of candidates, it will not be long before the need for cash donations swamps all other concerns.

Where that happens, politics is primed to deliver plutocracy - not democracy! The 2020 US presidential campaign clearly illustrates this rather obvious fact.

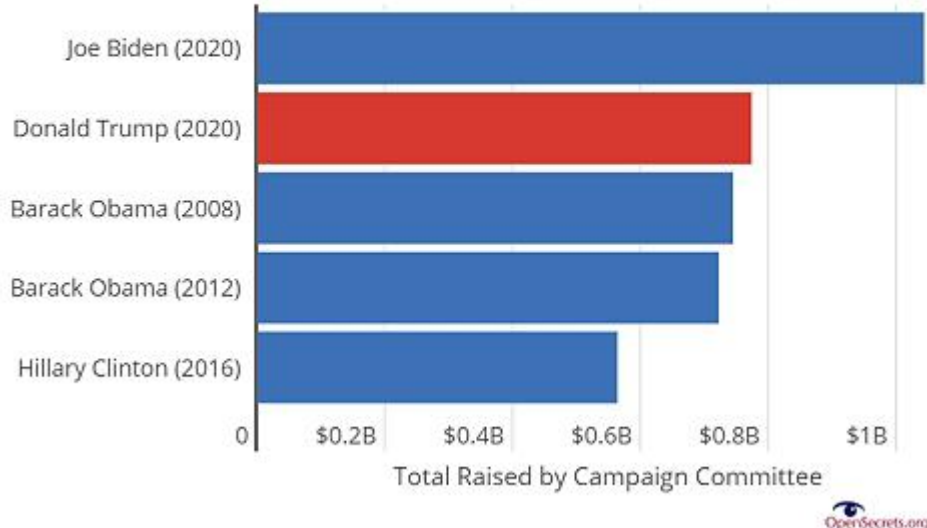

Karl Evers-Hillstrom and Brendan Quinn explained the role of fund-raising in the US 2020 presidential contest and illustrated the exponentially growing funding needs of those who aspire to the presidency:

At the end of 2019, we predicted that 2020 was going to be "the most expensive election year" we'd ever seen - little did we know then that the price of the 2020 cycle would approach the mind-blowing figure of \$14 billion, roughly double the cost of the 2016 election. In the presidential race between President Donald Trump and former Vice President Joe Biden as well as high-profile races for Congress, fundraising records were obliterated as both parties sought control.

But elections weren't the only place political money was spent. As the novel coronavirus pandemic spread across the nation, virtually every industry shelled out cash to lobby for relief. As the crisis began to impact the stock market, a number of prominent political figures found themselves in hot water for suspiciously-timed trades....⁶⁴⁴

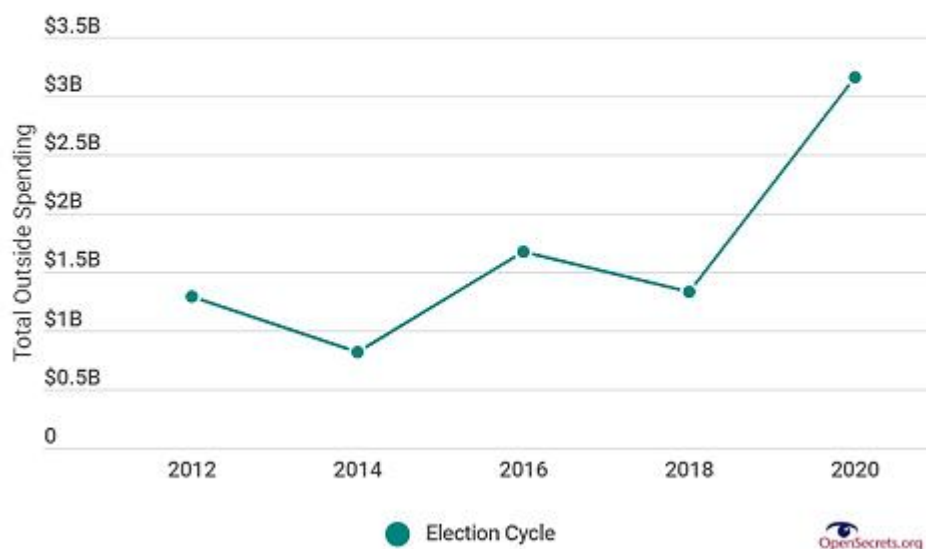

Presidential campaign committee fundraising

Excluding self-funders, Joe Biden's 2020 presidential campaign is the first ever to raise \$1 billion, blowing past previous fundraising records.

Total Outside Spending by Cycle

Since the 2010 Citizens United v. FEC decision, super PACs and "dark money" groups have spent over \$1 billion almost each election cycle, but this year marks a all-time high of about \$3.2 billion.

Inevitably, political parties court donors - particularly those able to contribute multi-million dollar amounts to campaigns. And so, equally inevitably, such parties become captive to major corporate players⁶⁴⁵.

Wherever the funds come from; there the center of political power will lie!

- If political aspirants are *privately* funded, then the private sphere will, behind the scenes, hugely influence political decision making.
- If political aspirants are *publicly* funded, then 'the people' - the voters - will have greater influence.

So, the question is: politically, what kind of nation has the United States become in this 21st century? Is it a 'democracy'; a 'plutocracy'; a fast maturing 'fascist' nation; or a militarist state, a 'cimilicy'? ⁶⁴⁶

Democratically organized capitalist societies presume the primacy of the community over the marketplace⁶⁴⁷.

Laissez faire (that is, plutocratically organized) capitalist societies, by default, [presume the primacy of the marketplace](#) over the community⁶⁴⁸.

This distinction is not trivial - It's **either** Democracy **or** Plutocracy⁶⁴⁹.

In the first case, [control of credit ultimately resides in the public sphere](#). Democratically organized governments establish central banking authorities which control the monetary base, generate credit and administer publicly determined regulations ensuring the economic wellbeing of their populations and both monetary and financial stability.

One of the most important achievements of the New Deal period was to clarify and consolidate public underwriting, supervision and regulation of credit creation and distribution.

[Thomas Hanna \(2017\)](#) has cogently argued that state and local government infrastructure funding can reasonably be provided by Central Banks issuing new money in ways analogous with the funding of sovereign government requirements. As he says: ⁶⁵⁰

There are at least two ways to go about this. In one, the Federal Reserve would create money just as it did through its post-financial crisis "quantitative easing" (QE) program, when trillions in new money was pumped into the financial system through the purchase of securities from banks. These funds could then capitalize a national infrastructure bank or a network of state-level infrastructure banks. [Brown] calls this "qualitative easing," because the money would be injected into the real economy rather than into the balance sheets of the major Wall Street banks.

The other approach would be for the Treasury, Federal Reserve or Congress to create the money and just directly invest it in infrastructure projects. Whether funneled through a public bank or banks, or invested directly, the funds could be provided at no or very low interest, allowing states and localities to pursue a host of pressing infrastructure projects without levying or raising taxes, tolls and user fees.

Robert Raymond has expanded on the possibilities of public funding of US regional and local government. As he argues,

...[T]here is a budding movement in the United States that is working to reimagine banking as an institution that truly serves the public....

What makes public banks different from traditional banks is that they are actually accountable to the public - they're democratic. So the public can not only decide what services the bank provides and where their taxpayer dollars are invested, but they also have a say in what kinds of investments are off limits....

So instead of having our money going to purposes that are antithetical to our values, public banking is a way to move toward a more equitable and sustainable economic system."

Despite gaining traction on both the national and state levels, the push for public banking has really taken off on a municipal level, with cities like San Francisco leading the way.

"We see the need for public banking all over the country right now, but there's no better example of it anywhere else than in San Francisco, which is one of the wealthiest cities in the world but also one of the most unequal in terms of income," Kurtis Wu, an organizer with the

San Francisco Public Bank Coalition, told Truthout. "We have 7,000 unhoused residents on the streets of San Francisco. Rent is now approaching \$4,000 for a one-bedroom apartment. Our infrastructure is crumbling, our public transit system is embarrassing. We see public banking as a mechanism that can really start to redirect capital toward these things."

(Robert R. Raymond, [Wall Street Beware: The Public Banking Movement Is Coming for You](#), *Truthout*, July 5, 2019)

In the second case, [no such public responsibilities are recognized](#).

Transactions between private parties are free of government 'interference'. As Thomas Huxley put it,

...The State is simply a policeman, and its duty is neither more nor less than to prevent robbery and murder and enforce contracts. It is not to promote good, nor even to do anything to prevent evil, except by the enforcement of penalties upon those who have been guilty of obvious and tangible assault upon purses or persons.
(1893, p. 258)

One of the central aims of the neoliberal resurgence in the post-New Deal era has been the [dismantling of the New Deal legislative understandings and measures](#) which ensured public control of credit creation and distribution. As [Margaret Thatcher](#) explained to the faithful at the 1983 British Conservative Party conference, "There is no such thing as public money; there is only taxpayers' money" ⁶⁵¹.

Much of the economic confusion which exists within 21st century Western capitalist societies stems from failure to recognize the incompatibility of these two options. [One either has democracy or one has plutocracy](#) - one can't have both ⁶⁵².

It's robber barons⁶⁵³ and their minions⁶⁵⁴ or, as Abraham Lincoln expressed it:

"We here highly resolve ... that government of the people, by the people, for the people, shall not perish from the earth"
(Gettysburg Address, November 19, 1863).⁶⁵⁵

Beardsley Ruml spelt out the Roosevelt administration's understanding of the nature of credit within a democratically organized capitalist society:

...our Federal Government has final freedom from the money market in meeting its financial requirements.

With control of its own 'printing presses', government could *create credit* as required. The journal editor of Ruml's paper summarized:

...[G]iven (1) control of a central banking system and (2) an inconvertible currency, a sovereign national government is finally free of money worries and need no longer levy taxes for the purpose of providing itself with revenue.

An explanation issued by the US Federal Reserve in 1939 put it even more clearly:

Federal Reserve Bank credit... does not consist of funds that the Reserve authorities "get" somewhere in order to lend, but constitutes funds that they are empowered to create.

The process of creation is one of giving the promises of the Federal Reserve Bank - in the form of Federal Reserve notes and reserve

deposits - in exchange for the promises made by others to the Federal Reserve Banks, the reason for the exchange being that the Federal Reserve Banks' promises are recognized by law as having a particular monetary utility not possessed by the promises of individuals or of private institutions.

That is, Federal Reserve Bank promises - or "liabilities," as they are commonly called - serve in the form of Federal Reserve notes as the principal element of the circulating medium, and they serve in the form of reserve deposits as a basis for the extension of credit by member banks. These are the specific uses of the funds that have their source in Federal Reserve Bank credit.

(*The Federal Reserve System - Its Purposes and Functions*, First Edition, May 1939, US Federal Reserve, p.85)

(See Jan Kregel, ^œ*Wright Patman's Proposal To Fund Government Debt At Zero Interest Rates: Lessons For The Current Debate On The Us Debt Limit*, Levy Economic Institute, Policy Note 2014 / 2)

One of the signal achievements of the New Deal period was this clarification of the credit issuing responsibility of democratically organized sovereign governments. What had been implied since the formation of the Bank of England in 1694 and its subsequent close interaction with the British Treasury and Exchequer (see ^œPierre Ortlieb (2018); ^œThomas Russell (1916 pp. 81-90); *What are Central Reserve Authorities?*; and *Central banks are state institutions*) was, at last, formally recognized and employed in economic direction and regulation - resulting in *prolonged economic stability* and improving social equity⁶⁵⁶ within democratically organized Western nations.

The Importance of Public Control of Private Credit Creation 📅

(11/02/18) (08/06/18) (15/09/18) (11/10/21)

Of course, as Voltaire (amongst others) is reputed to have observed, with great power comes great responsibility. With the power to create credit comes the responsibility to regulate its supply and the Roosevelt administration, through a range of legislative measures stemming from the *Pecora Commission's findings*, instituted far-reaching private and public financial reforms. Amongst the most important were measures designed to strengthen government control of credit creation and distribution.

Francis Bacon, in a 1625 essay, summed up the state's responsibility:

Above all things, good policy is to be used, that the treasure and moneys, in a state, be not gathered into few hands. For otherwise a state may have a great stock, and yet starve. And money is like muck [manure], not good except it be spread. This is done, chiefly by suppressing, or at least keeping a strait [strict] hand, upon the devouring trades of usury, ingrossing [accumulating (cf. *Blackstone (Intro. p.17))*]] great pasturages, and the like.

(Francis Bacon, ^œ*Of Seditions and Troubles*, *Essays*, No. 15 (1625))

Discussions of entries in *a democratically organized government's accounts*, through which it keeps track of the credit/currency

- it has issued to (debit entries - i.e. Government 'spending')
- and has withdrawn from (credit entries - i.e. Government 'taxes')

the private sector, have all-too-often [assumed that the term 'debit' necessarily presumes 'debt'](#) - though, of course, in this case the term being used is [a bookkeeping convention](#) which *does not* presume 'debt'⁶⁵⁷. In consequence, far too many people, who should know better, become concerned about the 'debt' which the government is accumulating in issuing credit. Of course, the credit is *created*, not borrowed or taken from some stockpile of credit - whether held by the government or any other entities (metaphysical or corporeal)

It needs to be emphasized that this understanding of the nature of 'sovereign debt' was not new. Thomas Macaulay, in 1849, had clearly explained the consequences of increasing the 'national debt' for Great Britain, starting from the accession of James II to the British throne in February 1685.

In the course of a narrative dealing with what he described as 'an important fiscal revolution', Macaulay described the process through which Great Britain launched into 'sovereign debt'. Once this happened it became inevitable that the process would be formalized and legitimized through the establishment of the Bank of England.

How little we have learned in the past three or more centuries. Then, as now, there was 'anguish and despair' among those who *knew* that descent into a 'debt laden future' would 'permanently cripple the body politic'. As he says,

...At every stage in the growth of that debt the nation has set up the same cry of anguish and despair. At every stage in the growth of that debt it has been seriously asserted by wise men that bankruptcy and ruin were at hand. Yet still the debt went on growing; and still bankruptcy and ruin were as remote as ever.

When the great contest with Lewis the Fourteenth [Louis XIV of France] was finally terminated by the Peace of Utrecht, the nation owed about fifty millions; and that debt was considered, not merely by the rude multitude, not merely by foxhunting squires and coffeehouse orators, but by acute and profound thinkers, as an incumbrance which would permanently cripple the body politic; Nevertheless trade flourished; wealth increased; the nation became richer and richer.... (Thomas Babington Macaulay, ^æ[The History of England from the Accession of James II. Volume 4](#), Chapter 19, P. 327, Longman, Green, London 1864)⁶⁵⁸

Pierre Ortlieb (2018) has expanded on this:

...[T]he history of central banks shows them to be far more intertwined with states and treasuries than current commentary or policy would suggest. At their founding, central banks frequently served not as constraints on the state, but rather as fiscal agents of the state. The inception of the Bank of England (BoE) in 1694, for example, was the result of a compromise that granted the state loans to finance its war with France, while the BoE was granted the right to issue and manage banknotes. As a result of this bargain, the market for public debt in the United Kingdom exploded in the 18th century, and government debt peaked at 260 percent of GDP during the Napoleonic wars. This both facilitated the expansion of Britain's hegemonic financial position and enabled the industrial revolution, as borrowing at low risk made vast industrial development possible.

(Pierre Ortlieb, [Victorian despite themselves: central banks in historical perspective](#), *Economic Questions*, September 9, 2018)

As Ortlieb explained, unlike neoliberally justified 'independent' central banks of the early 21st century, 'at their founding, central banks frequently served not as constraints on the state, but rather as fiscal agents of the state'. They were not established as 'impartial', independent constraints on government expenditure but as facilitators of the credit governments determined that they needed. *The responsibility for regulation and constraint rested with the governments*, not with the central banks!

Ortlieb's reference to the British Government 'borrowing at low risk' needs to be understood in terms of the initial establishment of the Bank of England as *an independent bank* servicing Government credit.

Its putative independence allowed it to benefit in two ways from the arrangement: it 'was granted the right to issue and manage banknotes' - giving it an underpinning privilege in dealings with private banks and similar entities; and, it received an interest return on the credit it supplied to Government. The latter benefit should be seen as a transitional one resulting from the decision to create a 'national bank' (modelled on existing 18th century bank organization) which would supervise and control sovereign credit creation within the nation.

From that early beginning, national reserve banks, in capitalist nations, gradually morphed into wholly state controlled entities servicing both government's credit requirements and the credit requirements of private banking.

With movement from the gold standard (US internal credit and currency was removed from the gold standard by FDR on June 5, 1933) and with federal control of reserve bank activities, national reserve banks effectively became government departments both providing and regulating credit supply throughout the nation. Inevitably, [through the 20th century most reserve banks became formally recognized as state-owned entities](#). Their 'profits', therefore, became 'government profits'.

Once this happened the charging of 'interest' on credit provided to government became anachronous, as did the issuing of 'government bonds' by treasuries in order to trigger reserve bank credit creation on their behalf.

[Government treasuries and government reserve banks became two interdependent departments of the same government](#) and Treasury requests for required credit became similar to other inter-departmental requests. What had been referred to as 'bonds' issued by government and 'bought' by the putatively independent central bank became *requisitions* requiring the central bank to provide credit and other services at the direction of the Treasury - both were charged with *implementing* politically determined regulations and directives.

In the light of the neoliberally driven absurdities of this century, it is important to stress that **both** payment of interest on credit provided to government by their central banks **and** the issuing of 'bonds' as the means of obtaining necessary credit from their central banks became anachronous.

While the shift to full ownership of central banks by their associated governments became standard in the post WW2 period, the practices of those governments, written into government legislation over many years, failed to reflect the new realities. So, we have the, now redundant, practice of Treasury Departments issuing 'government bonds' for 'sale' to their

central banks in order to obtain the credit they need. Those bonds, of course, are now identical in purpose to the issuing of 'requisitions' which is standard in other inter-departmental transactions.

Rewriting of the relevant legislation in capitalist nations to reflect the new realities is long overdue!

Neoliberal policies and practices over the past half century and more have relied on that arcane legislative language and so have denied the new reality, arguing that the legislative language makes central banks independent entities which 'lend' to governments. So, preposterously, governments are assumed to accumulate 'deficits' when relying on central bank credit creation and those 'deficits' must be 'repaid'. Capitalist nations have been hogtied by failure to update their arcane central-bank-related legislation.

The failure to update legislation to the new reality of government owned and controlled central banks should not be seen as a mere consequence of legislative inertia. The mystification of sovereign credit creation and obfuscation of the government's power over central bank activities was part of a deliberate campaign to reinstate a 1920s free-market deregulatory environment.. As [S. W. Adams explained](#),

...[W]hen Mr. Eccles, the then chairman of the Board, retired, the Board had discovered that the book [The Federal Reserve System Its Purposes And Functions] had made banking so simple that the masses could understand it and that was intolerable: money must be kept a mystery. The few who got hold of the book began to ask why Congress should surrender a delegated Constitutional power to private corporations who used it for private gain....

...The Board [which] had come to realize the great danger to their money power gained and exercised through the Reserve Act of 1913, promptly stopped the distribution of this book, and had it rewritten, completely omitting or obscuring the damaging statements.

[What are Central Reserve Authorities?](#)

 (02/02/17) (29/06/18) (25/01/16)(19/11/16)(01/12/16) (03/10/16) (17/10/16) (27/06/17)
(28/06/22) (18/04/23)

One of the many admirable features of the US New Deal period was the willingness of the US administration to [ensure a well-informed public](#). In 1939, the Board of Governors of the US Federal Reserve System published a book entitled *The Federal Reserve System: Its Purposes and Functions*. As it explained in the foreword:

This book is intended primarily for students, bankers, business men, and others who desire an authoritative statement of the purposes and functions of the Federal Reserve System. It is neither a primer, nor is it an exhaustive treatise. The aim has been to have it cover the middle ground between those extremes and to make it clear and readable without neglect of essentials.

The Federal Reserve System is twenty-five years old this year. Its operations have become a factor of great importance in American economic life. While they chiefly concern banks and the Government, their effects extend into all forms of economic activity and are felt indirectly by everyone.

It is desirable, therefore, that the Federal Reserve System be as fully understood as possible by the public in whose interest it was established and in whose interest it is administered.

(*The Federal Reserve System - Its Purposes and Functions*, First Edition, May 1939, US Federal Reserve)

The clarity of its explanation and description of the Federal Reserve System makes this [suppressed book](#) an enduring source of information for all who wish to understand the nature of Central Reserve authorities in sovereign nations.

David Bholat and Karla Martinez Gutierrez, writing on the *Bank of England Bank Underground* blog site, explained the varied relationships between central governments and their associated central banks in 2019⁶⁵⁹.

Historically, there has been confusion over the nature of credit and the roles of government and private money markets in its creation. In large part this has been an inevitable consequence of the quasi-private nature of the formation of the Bank of England in 1694 and its subsequent history (see: ^œ[The Bank of England Restriction. 1797-1821](#), *The North American Review* Vol. 105, No. 217 (Oct., 1867), pp. 393-434; ^œ[When Britain went fiat and the skies remained above](#), Bill Mitchell, *Billy Blog*, November 30, 2016; ^œ[Thomas Russell](#) (1916 pp. 81-90))

The Bank of England provided a description of its history and nature:

The beginnings of the Bank

The revolution of 1688, which brought William and Mary to the throne, gave England political stability for the first time in nearly a century.

Businesses flourished, but the public finances were weak and the system of money and credit was in disarray. The goldsmith bankers, who had begun to develop the basic principles of banks as deposit-takers and lenders, had been damaged by the lax financial management of the Stuart kings.

There were calls for a national or public bank to mobilise the nation's resources, largely inspired by the Dutch example of the Amsterdam Wisselbank. Many schemes were proposed. The successful one, from Scottish entrepreneur William Paterson, invited the public to invest in a new project. The public subscriptions raised £1.2 million in a few weeks, which formed the initial capital stock of the Bank of England and was lent to Government in return for a Royal Charter. The Royal Charter was sealed on 27 July 1694, and the Bank started its role as the Government's banker and debt manager...

(^œ[History of the Bank of England](#), *Bank of England*, accessed 03 December, 2016)

The quasi-private nature of US Federal Reserve Banks has continued to muddy the waters to the present⁶⁶⁰. As a US Federal Reserve FAQ explains:

The 12 regional Federal Reserve Banks, which were established by the Congress as the operating arms of the nation's central banking system, are organized similarly to private corporations - possibly leading to some confusion about "ownership." For example, the Reserve Banks issue shares of stock to member banks. However, owning Reserve Bank stock is quite different from owning stock in a private company. The Reserve Banks are not operated for profit, and ownership of a certain amount of stock is, by law, a condition of membership in the System. The stock may not be sold, traded, or pledged as security for

a loan; dividends are, by law, 6 percent per year.

(*US Federal Reserve Board* : Current FAQs: ^œ[Who owns the Federal Reserve?](#))

While there is still, in the 21st century, some confusion in Western sovereign nations as to the nature of Central Banks, it is important to remember that in Western nations, *Central Banks are State Institutions*. No matter how loudly neoliberal aficionados might proclaim Central Bank independence⁶⁶¹, they are creatures of Government and no more independent of government than are Treasuries or Ministries of Finance.

Keynes, in 1933, before the Roosevelt administration's clarification of the credit issuing responsibility of democratically organized sovereign governments, reflected that confusion in an open letter to Roosevelt. In it he referred to government *Loan* expenditure⁶⁶² when describing government's role in the "stimulation of output by increasing aggregate purchasing power":

...[A]s the prime mover in the first stage of the technique of recovery I lay overwhelming emphasis on the increase of national purchasing power resulting from governmental expenditure which is financed by Loans and not by taxing present incomes. Nothing else counts in comparison with this. In a boom inflation can be caused by allowing unlimited credit to support the excited enthusiasm of business speculators. But in a slump governmental Loan expenditure is the only sure means of securing quickly a rising output at rising prices.
(^œ[An Open Letter to President Roosevelt](#), John Maynard Keynes, Oxford, England, FDRL: PPF: 140: Frankfurter, Felix, December 16, 1933)

This apparent presumption of the need for Government borrowing in private money markets to fund government spending has been perpetuated to the present amongst many who [profess to be 'liberal' economic commentators](#). Paul Krugman, in an Op-Ed piece in the *New York Times* illustrates this:

...the mismatch between desired saving and the willingness to invest has kept the economy depressed. Remember, your spending is my income and my spending is your income, so if everyone tries to spend less at the same time, everyone's income falls.

There's an obvious policy response to this situation: public investment. We have huge infrastructure needs, especially in water and transportation, and the federal government can borrow incredibly cheaply - in fact, interest rates on inflation-protected bonds have been negative much of the time (they're currently just 0.4 percent). So borrowing to build roads, repair sewers and more seems like a no-brainer.

(^œ[Ideology and Investment](#), *New York Times*, Oct. 26 2014)

The question has to be - "Why borrow?". As [Beardsley Ruml](#) (1946) explained: "...our Federal Government has final freedom from the money market in meeting its financial requirements".

On a related matter, the emergence of the US dollar as the international reserve currency of choice is largely a by-product of 'gold standard' negotiations. And, given the 21st century weaponizing of the dollar there seems to be little other than inertia preventing its displacement by credit reserve swaps between nations ⁶⁶³.

The presumption (by those who deeply believe in the preeminence of 'internationalized free markets' guided by an 'invisible hand') that government is not (or should not be) an *issuer but a user of credit* leads to the presumption that 'government debt' (created by the generation and dispersal of credit to fund government activity) needs to be, as US Federal Reserve Chairman (1987-2006) Alan Greenspan put it, 'repaid'; and that future government commitments 'owed' to 'the public' need to be 'funded'.

Those who live comfortably within ideologically defined realities seldom need to address, or even be aware of, the core presumptions which subliminally frame their lives.

This has been inadvertently demonstrated in a report on their research 'discovery' by two Scandinavian economists. Sublimely unaware of the ideological frame circumscribing their own understanding of the world, they inform their readers that their research has uncovered a 'tendency, termed divine legitimation', which

...incentivized rulers to embed religion into institutions. We illustrate within a simple framework that the use of religion to legitimize power and the consequent institutionalization of religion may help explain why religion and religious institutions have persisted despite modernization.

(Jeanet Sinding Bentzen & Gunes Gokmen, *The power of religion Journal of Economic Growth* , Vol.28, Pp 45-78 (2023))

Beware all ideologues - particularly those who claim that their ideological blinkering does not exist but alert us all to the 'religious' blinkering of others!⁶⁶⁴

The Nature of Government Bonds or 'Debt Securities' 🇺🇸

 (31/12/16) (30/01/17) (23/09/17) (25/03/18) (01/06/20) (12/06/18) (22/03/18)

Let's start this discussion by stipulating that the sleight-of-hand process of relabeling fiat-currency-issuing governments' *unencumbered sovereign credit* requirements as 'government debt' and then 'selling' that 'debt' to private institutions and investors as 'Government Debt Securities' is an attempt to validate private credit creation as the only source of Government credit (based in a confusion stemming from the *historic role of gold* in setting the *putative value of national currencies*).

As *Damian Paletta explained* of the burgeoning US federal deficit. It is,

...the difference between what the *government earns* in revenue and *spends* on programs. (My emphasis)

There is a substantial group of 'experts' whose belief that all credit originates in the private sphere (and so, Sovereign governments must 'earn' the 'income' they *use*) is justified, in their own minds, by a felt need to account for a *US legal directive* which stipulates that

...direct [and guaranteed] obligations of the United States ... may be purchased only in the open market.

US 'Debt Securities' *must* be bought on 'The Open Market' 🇺🇸

 (22/01/17) (03/02/17) (23/01/17)(20/02/17) (16/02/17) (03/04/17) (16/03/18) (05/06/20) (08/06/20) (28/06/20) (24/09/20) (06/11/20) (11/11/20) (11/01/21) (03/03/21) (08/10/21) (03/02/23) (21/06/23) (09/10/23)

To understand this section one needs, first, to realize that the convoluted explanations of sovereign government financing underpinning neoliberal economics are generated by and 'justify' neoliberal ideology. And, underpinning that neoliberal ideology has been a determination to privatize the world.

Over the past fifty-plus years there has been a world-wide self-serving, plutocratic drive to remove all public restrictions on private 'enterprise' (including parochial 'laws and regulations', [\(especially all forms of sovereign 'capital control' of currencies\)](#), which hinder the free flow of financial transactions across national borders).

In the process they have subverted public responsibility for the wellbeing of communities, determinedly converting public goods, services and resources into internationalized, private, profit making 'assets' controlled by private 'individuals', not governments.

Those convoluted neoliberal explanations are generated by the need to 'explain' a capitalist world founded on a simplistic (or disingenuous) failure to understand that a sovereign nation's internal credit requirements are underwritten by that sovereign government's ability and willingness to [create credit](#) and [control its supply within the nation](#).

They are a product of the absurd, self-serving belief that, in this 21st century, government is not (or should not be) an issuer but a user of credit and that privately generated credit should be supplied by those internationalized forces that have captured their resources and distorted/dismantled the public responsibilities of government.

Bill Mitchell has illustrated this in describing the Reserve Bank of Australia's attempt 'to educate the population on these matters' in a blog posting entitled [^{ae}Australian government issues debt, buys most of it itself, and then pays itself interest into the bargain](#) (October 07, 2021). A commenter on the post, pseudonymed Ikonoclast, put it well:

My naive question is this. Why does Federal Government debt have to exist at all? Why not create the money without the associated debt? When one owes debt to oneself the net result is zero. What does double-entry bookkeeping achieve in this case? I suspect the "book" if it was in physical form would have the shape of a fig-leaf.

When the world in which one lives is illusory its justificatory policies become phantasmic!

It is long-past time for truly sovereign nations (that is, nations whose 'leaders' have not sold the souls of themselves and their populations to servitude, becoming vassal states enthralled to and in awe of some hegemonic power) to exercise their sovereign economic and civil rights and responsibilities.

As [Beardsley Ruml \(1946\) explained](#), they can *create* the credit they need without becoming indebted to either domestic or international 'money markets'. And they do not need to believe themselves burdened by insurmountable 'debts' in doing so!

There is, at last, a developing momentum toward bilateral central bank links between sovereign nations, bypassing the Washington controlled international monetary system. Associated Press describes one such emerging development:

Iran and Russia have taken a key step toward linking their banking systems in a move that further boosts their cooperation in the face of Western sanctions, an Iranian official said.

At a signing ceremony on Sunday, Mohsen Karami, the deputy central bank governor, said banks in the two countries had connected their messaging networks following agreements reached over the past year, according to the state-run IRNA news agency.

It was not clear whether those links would allow for the transfer of funds, and services were not yet available to bank customers. Karami said 100 banks in 13 other countries were connected to the network, without naming them.

There was no immediate comment from Russia or the United States, which has worked with its allies to isolate both countries.

In response to Russia's invasion of Ukraine nearly a year ago, Western countries banned key Russian banks from the Belgium-based SWIFT financial messaging system, which daily moves billions of dollars around the world among more than 11,000 banks and financial institutions.

(^œ[Iran, Russia move to link banks to evade Western sanctions](#), *Associated Press*, February 01, 2023)

The year 2023 might well go down in history as the year in which Washington's Dollar Hegemony was fatally undermined,⁶⁶⁵

One can but hope that the emerging networks will not replicate Washington's irrational obsession with central bank created 'national debt' obligations and equally irrational belief in the need for sovereign governments to 'borrow' from domestic and international money markets to fund sovereign responsibilities.

Before we begin an examination of this topic: here is the standard 21st Century, neoliberal explanation of the consequences for sovereign nations of engaging in increased '[sovereign debt](#)' creation:

...[A] tsunami of sovereign debt distress is coming. And the choice for the private creditors of low- and middle-income countries is simple and stark: agree to an orderly process of debt mitigation that shares the burden and limits the damage or demand immediate repayment and set off a wave of catastrophic defaults that sweeps many countries - and their creditors - away....

To avoid a catastrophic string of defaults, governments and private creditors must share the burden of providing debt relief. This is a matter both of fairness and of ensuring adequate funding. But a successful debt relief scheme cannot rely on the initiative of individual creditors, since they are unlikely to soften their opposition to debt deferment under the current circumstances, and in any case, relief provided by participating creditors would simply go toward debt service payments to nonparticipating ones....

The worst may be yet to come. In the poorest countries, private creditors hold only ten percent of sovereign debt. In many middle-income countries, by contrast, the private sector holds more than 80 percent. Commercial creditors have already expressed their reluctance to defer the debts of the poorest countries. It would be a mistake - an expensive mistake - to allow them to free-ride when middle-income countries come calling in a few months' time.

(Patrick Bolton *et al*, ^œ[How to Prevent a Sovereign Debt Disaster: A Relief Plan for Emerging Markets](#), *Foreign Affairs*, June 4, 2020)

As [explained elsewhere](#), the major 'sovereign debt' problems of low- and middle-income countries stem from their re-colonization by the [stalking-horses of Neoliberal Capitalism](#): The IMF and the World Bank⁶⁶⁶.

Michael Hudson, interviewed by Bonnie Faulkner on the *Guns and Butter* website, summed it up:

Bonnie Faulkner: ...[W]hy has the World Bank, for instance, traditionally been headed by a U.S. secretary of defense?

Michael Hudson: Because its job is to do in the financial sphere what in the past was done by the military sphere.

The purpose of a military conquest is to take control of a foreign economy, to take control of its lands and to impose tribute on the defeated country.

The genius of the World Bank was to say, "We don't have to occupy and take over a country in order to impose tribute, in order to take over its industry and its agriculture and its land. Instead of bullets, we can use financial manipulation and maneuvering. As long as other countries play a game that we can control, finance can do today what it used to take bombs and loss of life by our soldiers to do."

In this case, the loss of life is in the debtor countries, population growth shrinks, suicides go up.

The World Bank is economic warfare that is just as destructive as military warfare, and this is exactly what Russia's President Putin said at the end of the Yeltsin period. He said American neo-liberalism in Russia destroyed more population in Russia than World War II. And the neo-liberalism, which basically is the doctrine of American supremacy and foreign dependency, is the doctrine of the World Bank and the IMF. (Michael Hudson, interviewed by Bonnie Faulkner, ^œ[transcript-The-IMF-and-World-Bank-Partners-In-Backwardness](#), *Guns and Butter*, 29 June 2019)

Anis Chowdhury and Jomo Kwame Sundaram, focusing on the consequences of the 2020 Covid-19 crisis and rich-country profit-based-supply of commercial vaccines, have described the ways in which financial liberalization has continued to impact these countries:

After being undermined by decades of financial liberalisation, developing countries now are not only victims of vaccine imperialism, but also cannot count on much financial support as their COVID-19 recessions drag on due to global vaccine apartheid.

Financialisation undermined South

Developing countries have long been pressured to liberalise finance by the International Monetary Fund (IMF) and the World Bank. The international financial institutions claimed this would bring net capital inflows. This was supposed to reduce foreign exchange constraints to accelerating growth, creating "a rosy scenario, indeed".

Globalisation's claim naively expects "more birds to fly into, rather than out of an open birdcage". Instead, financial globalisation meant net capital flows from capital-poor developing countries to capital-rich developed countries, i.e., dubbed the "Lucas paradox". A decade later, flows "uphill" had "intensified over time".

The past decade saw the largest, fastest and most broad-based foreign debt increase in these economies in half a century. Total foreign debt of emerging market economies rose from around 110% of GDP in 2010 to more than 170% in 2019, while that of low-income countries (LICs) increased from 48% to 67%.

(Anis Chowdhury and Jomo Kwame Sundaram, [Neoliberal Finance Undermines Poor Countries' Recovery](#), *Inter Press Service News Agency*, March 2 2021)

Julius Ihonvbere⁶⁶⁷, in 1994, described the consequences for those [financial-parasite infested](#) countries:

In country after country, stabilization and adjustment policies have culminated in or precipitated civil wars, ethnic and religious violence, coups and counter coups, demonstrations, massacre of protesting workers, peasants and women, inflation, bankruptcies, and an unprecedented deterioration in living standards and the general quality of life. There have been very destructive riots in Nigeria and Zambia to take just two examples...

...[T]he failure of these monetarist prescriptions, usually conceived in purely economic terms have delegitimized the state, its institutions and agents, and at the same time ruined indigenous producers thus facilitating the recolonization of Africa.

Brasil Wire, in a well-researched, two-part examination, explained how U.S. state and corporate power successfully captured political processes in Brazil⁶⁶⁸ in order to 'liberate' the Amazon region to foreign, private sector, exploitation:

In the 1970s, it was the World Bank that originally convinced Brazil's Military Dictatorship (which President Jair Bolsonaro would seek to emulate) that Amazon deforestation would be positive for the economy. In 1981 it launched a programme called 'Polonoroeste', for road network construction and the resettlement of cattle ranchers in the state of Rondonia. As Adrian Cowell documented in his film "Decade of Destruction", before international pressure forced the World Bank to cancel the project in 1986, thousands died and an area of rainforest the size of Great Britain had been decimated.

The World Bank's private-sector arm is the International Finance Corporation (IFC), a Council of the Americas elite member, which more recently gave its approval to development projects led by investment group Blackstone, with devastating consequences.

(Convivial War: How Wall Street Recolonized Brazil. ⁶⁶⁹[Part One](#) and ⁶⁷⁰[PartTwo](#), *Brasil Wire*, October 7 & 11, 2019)

When sovereign states yield or forfeit control of their own internal currencies and economies to foreign and/or international agencies, they relinquish their sovereignty and open their countries to [financial and resource predation](#) by foreign and international organisations and institutions. To talk about 'sovereign debt' in nations which have been recolonized over the past half-century and more is simply disingenuous - or evidence of stupidity!

As a well-worn aphorism has it:

Never attribute to villainy what is adequately explained by stupidity.

Neoliberal institutions, their economists and fellow travelers have not only highjacked the economies and currencies of low- and middle-income

countries, they have also, over the past fifty years and more, been intent on convincing Western capitalist nations that they too face a 'sovereign debt tsunami' if they engage in 'sovereign debt' creation. Here is how that has been 'justified':

[Daniel Thornton](#) explained the means by which the US treasury and Federal Reserve are legally required to 'finance deficit spending'⁶⁶⁹:

The Fed is forbidden by law to purchase government securities directly from the government. The government first sells securities to the private sector and the Fed then purchases securities from the private sector, specifically, government securities dealers.

The 1935 directive to which Thornton alludes states that 'direct [and guaranteed] obligations of the United States ... may be purchased *only in the open market*'.

However, those securities *purchased from the private sector*, as we will see, are not, in fact, 'securities' at all. They are Treasury requests (*requisitions*) directing the Federal Reserve to create the sovereign credit the Treasury requires⁶⁷⁰. The resulting document, received by the Federal Reserve, is *merely a record of the request* made by the Treasury.

Thornton's explanation, of course, begs the question: Why would this directive exist if it was not based on an understanding that all credit is created in the private marketplace? ⁶⁷¹

It is only when one examines that directive more closely that it becomes apparent that this is an unexplained and unjustified amendment tacked onto a piece of 1935 US legislation during its passage through the US House of Representatives. This occurred during a period when Roosevelt's legislative attempts to consolidate New Deal legislation were being most [vociferously opposed](#). The directive was, indeed, an attempt to derail the New Deal legislation and it has, since the 1950s, proved most effective in doing so.

The relabeling of a sovereign government's future sovereign credit needs as 'debt' seems deliberately designed to enable private financial institutions to [impose a private sector 'tax'](#) (disguised as '[interest rates on the country's debt](#)') on government credit channeled into the real economy. As S. W. Adams put it in 1957:

Why should the people give to bankers U.S. Bonds, and pay an annual interest on these bonds, that they might use their own credit? Why should the Government have to borrow its own money (use its own credit) when forced to use more revenues than current taxes afforded? (^œ[The Federal Reserve System Its Purposes And Functions](#) : As Originally Published, Washington, D.C., 1939, A Reprint of a Suppressed Public Document Published by OMNI Publications, May 1, 1958)

Belief in a [self-existent, self-sustaining economic environment](#), governed by its own peculiar principles of organization and behavior, seems to lead, almost inevitably, to a [belief that all credit is \(or, in an ideal world, should be\) created within that realm](#). Allowing government a central credit-creating/controlling responsibility within that environment is presumed to threaten the integrity of the autonomous economy.

[Daniel Thornton's claim](#) that "the U.S. Treasury has only one option for financing deficit spending - issuing debt", or Bill Mitchell's use of the term

'public debt instruments' in describing the nature of public bonds, conflate government bonds and 'government debt'. However, there is no 'natural law' of financing which requires this.⁶⁷²

Eccles, in 1947, explained the origin and purpose of the legislative amendment to the US Banking Act of August 23, 1935 which underpins all this. It was an amendment designed to serve the interests of [Private Sector bond dealers](#), pushed through the House of Representatives [by their lobbyists](#)⁶⁷³, and it has no logical purpose other than ensuring Private sector Bond Dealers' incomes!

Sovereign Government bonds are not the means by which 'the government sells debt to non-government bond dealers'.

Sovereign Bonds are sovereign bonds (just as currency is currency)⁶⁷⁴.

It needs to be remembered that we are speaking of [sovereign](#) bonds. Bonds issued by private bodies and/or by [non-sovereign public bodies](#) are indeed issued to raise revenue. Those who purchase bonds issued by lower levels of government or by private entities are lending credit to the issuers for an interest return. This has been neatly explained by Jerry Brown:

...[A] state government like California is not the currency issuer and actually does have to fund its spending projects. Bonds are one way California can do that. And those bonds may have the effect of reducing other people's spending power, (while increasing California's in the short term) especially depending on how the Fed rates them as collateral and how liquid the market on second hand California bonds is. There is always a real risk of default involved with a state government or corporate type bond that is not in any way comparable to default risk on a US government bond which is zero for all intents and purposes.

(Jerry Brown, Commenter on Bill Mitchell's blog '[More fun in Japanese bond markets](#)', *Billy Blog*, February 7, 2017)

(11/02/17) Sovereign bonds are, of course, not equivalent to currency. The purposes are quite different.

In the case of sovereign bonds, the purposes are two-fold:

1. They provide security to those who are looking for [a safe haven for surplus credit](#) and, in the process, set the baseline for interest rates in the economy.
2. They are [one of the means](#) by which sovereign governments can withdraw excess credit from the economy (the inducement of an interest return on credit employed in purchasing them is used to encourage their purchase).

Of course, when sovereign bonds are sold in private sector 'bond markets' 'to support government spending'⁶⁷⁵, the credit/currency employed in their purchase is withdrawn from the private realm and so [reduces available sovereign credit/currency](#) in that realm.

(09/03/17) [Michael Kalecki \(1943\)](#) explained the source of the confusion well:

To understand this process it is best, I think, to imagine for a moment that the government pays its suppliers in government securities. The suppliers will, in general, not retain these securities but put them into circulation while buying other goods and services, and so on, until finally these securities will reach persons or firms which retain them as

interest-yielding assets. In any period of time the total increase in government securities in the possession (transitory or final) of persons and firms will be equal to the goods and services sold to the government. Thus what the economy lends to the government are goods and services whose production is 'financed' by government securities. ***In reality the government pays for the services, not in securities, but in cash, but it simultaneously issues securities and so drains the cash off; and this is equivalent to the imaginary process described above.***

(My emphasis)

To use one of US president Donald Trump's favorite sayings: 'How Sad, so sad' that neoliberal ideologues (including those attempting to advise President Trump) should presume the 'imaginary process' to be 'reality' and the real process to be 'imaginary'!

Kalecki was writing in 1943. By the 1950s, as Adams explained, neoliberal 'experts' were claiming that sovereign bonds should be issued, not simply to pay for government expenditures, but to raise the credit 'needed' to pay for their expenditures from private banks. After all, as those 'experts' 'knew', all credit originates in the private realm. Sovereign bonds were, 'obviously', 'debt securities'.

The implication of Kalecki's explanation is that Government is able, through the issuing of bonds, 'to cover Government spending', ensuring that credit supply in the private sector is minimally affected by Government activity. In order to *increase* private credit supply, a government can issue bonds of lesser value than government spending; to *decrease* private credit supply, it can issue bonds of greater value than its spending. And, the effect of all this on processes of redistribution is positive since those who engage in bond market activity are, overwhelmingly, those who have accumulated credit.

So long as government spending flows directly into the real economy, bypassing the banks, this will directly affect credit availability in the real economy. And, since the prevailing belief in this neoliberal world is that, as Kalecki has explained, government spending is "'financed' by government securities", the private sector can remain blissfully unaware of the process by which government stimulates or dampens private economic activity and engages in redistributive activity.

So, the [claim by neoliberal ideologues](#) that 'Every dollar of increased government spending must correspond to one less dollar of private spending' can, only superficially, seem justified.

Sovereign government bonds are ***not***:

- * Public debt instruments;
- * Government debt sold to non-government bond dealers;
- * 'The public's holdings of government debt';
- * 'Debt securities issued by a government to support government spending';
- * Or any other of the multiple phrases which, when applied to *sovereign bond sales*, convey no intelligible information but seem, rather, to be [employed to obscure reality](#).

These phrases, when applied to sovereign bond sales are, as *Merriam-Webster's English Dictionary* explains, 'logical nonsense'.

To restate the obvious: All *sovereign bond sales* reduce available sovereign credit in the sector in which they are purchased - whether that is or is not the assumed purpose of the sales. However, *they do not increase* sovereign credit available to sovereign governments, nor do they increase sovereign 'debt' loads. Since sovereign credit is **always** created as needed, credit issued to repay bond principal to bond holders on maturity is also *created* when needed.

In the second case, currency is:

1. A tangible expression of sovereign credit circulating within the economy - and so can be held as an alternative to sovereign reserves by those who do not have access to sovereign reserve accounts.
2. And, of course, it can be used to purchase sovereign government bonds (withdrawing the currency from circulation - just as sovereign reserve funds used to purchase sovereign government bonds sequester those reserves).

Neoliberal explanation might attempt to [conflate sovereign government bonds with 'government debt'](#), but, in reality, [no debt is created in issuing bonds](#), and no debt is purchased when those bonds are sold. No matter how much bond markets might fluctuate, those fluctuations are contained within the private sector 'bond markets'. They have as little impact on a sovereign Government's ability to 'fund its commitments' as fluctuation in the watermelon market!

Of course, if a government 'believes' that fluctuations in private bond markets (or private watermelon markets!) will 'bring down the government' then the resulting behaviors and consequent voter reactions might well do that. However, the government's predicament is not brought about by fluctuations in the markets but by ideologically driven reactions to market behavior. Bill Mitchell has commented on all this:

...Apparently, this narrative alleges that if bond markets are not 'confident' (whatever that means) then they will stop begging treasury departments for more debt issues and the government, in question, will run out of money and then pensions will stop being paid and the public service will be sacked and public trains and buses will stop running and before we know it the skies will blacken and collapse on us.

The narrative ignores the usual statistics that bid-to-cover ratios are typically high (hence my 'begging' terminology) which are supplemented by well documented cases where the bond dealers (including banks etc) do actually beg central banks to stop driving yields down in maturity segments where these characters have pitched their "business model" (read: where they make the most profits).

The facts are exactly the opposite to the neo-liberal pitch. Currency-issuing governments never need to worry about how bond markets 'feel'. Essentially, the bond markets are irrelevant to the ability of such a government to design and implement its fiscal plans.

...So next time you hear an economist or a politician talk about how bond markets have to be satisfied and they use that as a justification for hacking into public spending (and driving up unemployment and poverty rates) you know they are lying and are frauds.

The bond traders **never** have to be satisfied. They can be forced to live on crumbs by the central bank if it so chooses.

(Bill Mitchell, ^œ[Currency-issuing governments never have to worry about bond markets](#), *Billy Blog*, April 3, 2017)

Capitalism is, indeed, the playground of ideologues.⁶⁷⁶

The reasoning which requires [credit to originate in the marketplace](#) was well illustrated in a speech given by the then Federal Reserve Board Chairman, Alan Greenspan, ⁶⁷⁷ in 2001:

...The substantial surpluses in retirement programs (especially social security) in recent years and in the nearer-term budget projections are on a cash basis. Were we fully accruing the benefit liabilities inferable from existing law, these retirement programs would currently be in deficit, and contingent liabilities amounting to about \$10 trillion for social security alone would have been added to the current debt to the public.

...I have long argued that paying down the national debt is beneficial for the economy: It keeps interest rates lower than they otherwise would be and frees savings to finance increases in the capital stock, thereby boosting productivity and real incomes. But the current budget projections are such that we need to consider what path of debt reduction is best for the economy...

(^œ[Remarks by Chairman Alan Greenspan: The paydown of federal debt](#), Before the Bond Market Association, White Sulphur Springs, West Virginia (via videoconference), April 27, 2001.)

The presumption that a sovereign government is (or should be) a user and not an issuer of credit results in 'government borrowing' in the private marketplace to fund its use of credit and so creates a real public debt which must be repaid.

This dangerously [tautologous understanding of the nature of 'government debt'](#) is not unique to Greenspan, it is merely an iteration of that free-market fundamentalism which [Thomas Huxley \(1871\)](#) described in the second half of the 19th century (though, as an [Ayn Rand acolyte](#), Greenspan has been particularly susceptible to tautologous reasoning).

Free-market fundamentalism has driven concern over the need to 'rein in expenditure' for much of the past forty years in Western economic circles. It has also ceded the [private financial marketplace unwarranted influence over sovereign governments](#).

How Democratic Capitalist Governments Generate Credit (and *manage perceptions* of economic stability)

 (14/08/17) (19/10/17) (19/04/19) (26/04/19) (29/04/19) (03/05/19) (17/07/19) (23/07/20)
(25/07/20) (30/07/20) (31/07/20) (02/10/20) (28/12/20)

We do not need to live in neoliberally organized societies - societies in which economists and politicians earnestly but illogically remind us that budget deficits reflecting reserve-bank-created credit are debts we pass on to future generations⁶⁷⁸; that taxes on '[wealth creators](#)' cost jobs; and that mega-wealth always 'trickles down', ensuring the wellbeing of us all.

As US Senator John Thune (R, SD, June 4, 2020)) explained of \$2.4 trillion Congress committed to fighting the Covid-19 pandemic,

...[W]e need to remember that every dollar we've provided is borrowed money that our children and grandchildren will have to repay.

Our debt was already very large compared to the size of our economy even before this year's coronavirus-related borrowing.

And that's a very concerning reality.

The truth is, we can't just keep borrowing and borrowing ever greater sums without suffering real economic consequences.

Bill Mitchell has summed up the 2020 Covid-19 crisis alternative to these kinds of neoliberal responses:

...[N]ational governments, which issue their own currency, could take up the entire wage and profits bill if it wanted to - to reduce the 'economic costs' of the lockdowns to close to zero.

Unemployment **did not have to rise**.

Businesses did not have to be destroyed.

If we had an enforceable lockdown and eliminated the virus, with our borders strictly controlled until a credible health solution was introduced, then no economic damage was necessary.

The economic losses that have been recorded to date - and they are massive - were avoidable.

They are not due to the lockdowns which were the sensible strategy for governments to adopt. I am thankful the Australian government took a relatively strict approach although I think they have relaxed the lockdown too early.

...The economic losses arise because the governments adopted a flawed fiscal approach. They knew they had to expand fiscal deficits but were still thinking surpluses.

Our own [Australian] Treasurer has even been channeling Margaret Thatcher in recent days - which means they are gearing up to further cut the already inadequate fiscal support.

(^œ**Academic freedom requires evidence and knowledge - not a desire for headlines**, Bill Mitchell - *Modern Monetary Theory*, July 28, 2020 - my emphasis)

Societies which conform to the presumptions spelled out by neoliberal aficionados are geared to ensuring increasing inequality⁶⁷⁹ and the consequent growth of **absurd credit accumulation**:

- **Budget Surpluses and Balanced Budgets** are *not* evidences of 'responsible economic management': they are **not** virtues⁶⁸⁰.
 - Beware electioneering which promotes these as responsible political goals. ⁶⁸¹
 - They are not.
 - Those who claim they are committed to such policies are affirming their commitment to neoliberal understandings aimed at benefiting the wealthy and increasing inequality.
 - Such policies **decrease** credit availability in the private sector.
 - They rely on removing credit from the economy, usually at the expense of social support for the lower 75% of the population - those with the least political power in most democracies.
- » This results in reduced sovereign credit creation and increased reliance on **private accumulations of credit**;

- » Communities become increasingly [reliant on borrowing private credit](#) to fund the necessities of life. To [paraphrase Bill Mitchell](#): "Private debt builds up and shonky (and criminal) bankers increasingly defy responsible and ethical business practice".
- Budget Deficits for positive socially responsible purposes are both *virtuous* and *responsible*:
 - Government has a [Fiduciary Responsibility](#).
 - Budget deficits **increase** credit availability in the private sector.
 - Of course, how that increased credit is fed into the private economy is important:
 - » If it is fed into the economy through various subsidies aimed at the 'top end of town' it will do little or nothing for those who most need it.
 - » If it is fed into the economy through [strengthening social institutions and services](#) it will benefit all who access those institutions and services.
- But, it will do much more than this!**
 - Credit fed into the system through socially responsible programs flows through them and into the private economy.
 - The positive effects will be experienced throughout the economy. To [quote James Galbraith](#): "Ordinary people benefit, but there is nothing in it for banks".
- Perennial Budget Deficits in support of "Military Defense" are irresponsible and [court 'Spiritual Death'](#).
 - Many of the most intractable problems in this 21st century world are products of such misplaced funding.

Nothing is 'lost' or 'owed' by the government when it issues currency and other forms of credit. The 'debit' entry is an idiosyncrasy of double-entry profit-and-loss bookkeeping. This accounting convention, through which the quantity of credit issued by government can be regulated and tracked through time (necessarily for ensuring long-term credit and currency stability) can all-too-easily, but, of course, illogically, be considered a Government *liability* which must be 'repaid'⁶⁸².

Equally, of course, since government creates credit, there is no point in stockpiling it. Credit withdrawn from the private sector reduces available sovereign credit in that sector, but it *does not increase 'government wealth'* and does not increase some imaginary sovereign credit stockpile - nor does it back-fill a putative 'deficit' pit (except in the minds of those who feel compelled to believe that such stockpiles and pits exist!). It is, however, recorded as a credit entry in the government's accounts so that the quantity of sovereign credit available in the private sector can be tracked through time.

The management of perceived credit stability 🗓️

 (19/01/16) (17/10/17) (13/02/18) (16/04/19) (24/10/19)

In the real world, governments must fund their activities without engaging in behavior which might result in various forms of price inflation or in a crisis in confidence as to the 'real worth' of credit and currency. As Samuelson put it: "What is important about the budget... is whether it is inflationary or deflationary, not whether [it is] balanced or unbalanced."

So, they cannot simply fund their activities by issuing credit. The upshot is that a government must [generate the credit needed to fund its activities while maintaining a stable monetary base](#). There are two basic ways in which this can be done:

- First, and most obviously, a government can 'tax and spend'. As Francis Bacon put it:

Good policy is to be used, that the treasure and moneys, in a state, be not gathered into few hands. For otherwise a state may have a great stock, and yet starve. And money is like muck [manure], not good except it be spread.

- There is nothing complicated in this: the government withdraws credit from the private realm, and distributes a similar quantity of credit to that withdrawn through its various activities - the order in which these occur is irrelevant since the government does not 'need' tax revenue in order to distribute credit.
- Over time, the monetary base remains stable and government spending results in private economic activity - it stimulates the economy through its activities. While such activity results in credit redistribution ([required to ensure ongoing, optimal credit circulation](#)), it does *not* result in diminished access to credit within the private sector.
- Second, and far more problematically, governments can (and unfortunately far too many have) become players in the private realm, borrowing the credit required to fund their activities from [unsecured-credit-creating banks \(a logical redundancy\)](#).
- (Since the mid-1970s, with the [triumph of neoliberalism](#), the removal of social costs from production and financial activity costs in Western economies (and insistence that [governments should 'borrow' credit, not create it](#)), has produced its inevitable consequence. Sovereign debt has grown steadily as governments have increasingly borrowed in the private financial marketplace and gone into deficit to cover those costs.)
- The logic of public borrowing within the private sector is dubious at best. The aim cannot be to limit the expansion of credit within the private sector since such borrowing is, inevitably, funded by [private credit creation](#). Once governments engage in such activity, they *do* create private sector 'debts' which must be repaid.
- In fact, [if they do not become profit-making players in the private realm, they will, ultimately, have to resort to creating credit](#) ⁶⁸³ in order to meet the loan and interest obligations they have incurred (*doubling* the credit creation consequences of their activity and rewarding the banks for their participation by matching their unsecured credit creation with newly acquired government-guaranteed credit - small wonder that banks delight in funding government activity!).

- It is this pernicious propensity of governments to indulge in private market borrowing to fund activity which causes much of the confusion in people's minds as to the dangers of a 'debt burden' bequeathed to future generations.

Deficits based on private sector borrowing are public debts owed to the lenders and generate all the costs associated with borrowing in private money markets.

Deficits reflecting government (i.e. Central Bank) created credit are not debts and generate no such costs. Bookkeeping entries, shown as debits and credits and generating 'interest' obligations between government agencies are illusory - as are "[credits, advances, or overdrafts to the government by the central bank](#)" (cf ^œ[Code of Good Practices on Transparency in Monetary and Financial Policies: Declaration of Principles](#), International Monetary Fund, Washington, D.C. September 1999, p. 10).

Beardsley Ruml (1946), Chairman of the Federal Reserve Bank of New York, provided a clear explanation of the difference between sovereign credit generation and private sector borrowing to fund government activity:

Free of the Money Market

Final freedom from the domestic money market exists for every sovereign national state where there exists an institution which functions in the manner of a modern central bank, and whose currency is not convertible into gold or into some other commodity.

The United States is a national state which has a central banking system, the Federal Reserve System, and whose currency, for domestic purposes, is not convertible into any commodity. It follows that our Federal Government has final freedom from the money market in meeting its financial requirements. Accordingly, the inevitable social and economic consequences of any and all taxes have now become the prime consideration in the imposition of taxes. In general, it may be said that since all taxes have consequences of a social and economic character, the government should look to these consequences in formulating its tax policy. All federal taxes must meet the test of public policy and practical effect. The public purpose which is served should never be obscured in a tax program under the mask of raising revenue. (Beardsley Ruml, '^œ[Taxes For Revenue Are Obsolete](#) ', ^œ[American Affairs](#), January 1946;

See '[What Taxes are Really For](#)' for more on this.)

 (05/05/17)

In most capitalist societies, increases in total spending and moderate inflation are deemed to be signs of 'economic health'. So, in most years, government spending *should* exceed government revenue collection. Galbraith, Wray and Mosler (2009) explained:

Federal spending can, and almost always does, exceed tax receipts. And that is almost always a good thing because it provides the wherewithal to allow the nongovernment sector to save in the form of highly desired, safe, dollar-denominated financial assets. Further, there is an important counterbalancing asset to the government's liability: the accumulated financial, physical, and human capital of our nation that is available to be called upon should we ever need to mobilize capital to serve the public purpose.

(James K. Galbraith, L. Randall Wray, Warren Mosler, ^œ[The Case](#)

 (31/03/16)

The use of the term 'government liability' in the above quotation needs to be recognized for what it is. If Beardsley Ruml's explanation is correct then any 'liability' incurred by government in funding infrastructural activity and services through central-bank-generated credit is merely a reflection of the features of double entry bookkeeping (a means of keeping track of quantities of credit generated through time), not a liability which *must* be 'funded' by future revenue raising. As [The Federal Reserve explained in 1939](#), "Federal Reserve Bank promises - or "liabilities," as they are commonly called - serve in the form of Federal Reserve notes as the principal element of the circulating medium".⁶⁸⁴

As the authors suggest, in most years, government spending *should* exceed government revenue raising. 'Balanced budgets' lead to assumed economic 'stagnation' and consequent 'bear markets'.

[James Galbraith \(2010\)](#) explained how perceived 'economic growth' is achieved in capitalist societies:

To put things crudely, there are two ways to get the increase in total spending that we call "economic growth." One way is for government to spend. The other is for banks to lend. Leaving aside short-term adjustments like increased net exports or financial innovation, that's basically all there is. Governments and banks are the two entities with the power to create something from nothing. If total spending power is to grow, one or the other of these two great financial motors - public deficits or private loans - has to be in action.

And, one might add, in the interests of simplicity and economic stability, if governments wish to remain 'free of the Money Market', they should be very wary of crossing the wires of the two options through which spending might be financed. Governments should 'tax and spend'. This can be a nuanced process with lags between taxation and spending. Spending can (and usually does) precede taxation (or even occur without compensating taxation) for so long as the money supply is *perceived* to be stable. [As we've already seen](#), it's all about *long-term perceived balance* - with spending growth and inflation subliminally factored into the perceived stability.

James Galbraith explained why Government expenditures benefit 'ordinary people':

For ordinary people, public budget deficits, despite their bad reputation, are much better than private loans. Deficits put money in private pockets. Private households get more cash. They own that cash free and clear, and they can spend it as they like. If they wish, they can also convert it into interest-earning government bonds or they can repay their debts. This is called an increase in "net financial wealth." Ordinary people benefit, but there is nothing in it for banks.

When sovereign governments 'put money into private pockets' they increase the net wealth of the recipients. When private banks 'lend' to those private 'pockets' they increase the net debt owed by the recipients of the 'loans'. [John Siman explained](#) it well:

In any society in which interest on loans is calculated, [borrowers are] inevitably subject to being impoverished, then stripped of their property, and finally reduced to servitude.

Only Believe... 🦋

 (01/07/16) (19/05/16) (12/06/16) (14/01/17) (27/04/17) (24/05/17) (05/06/17) (24/08/19)

In the early decades of the 21st century, the Western World is rife with ideologues, simplistic thinkers and opportunists who have, in one way or another, gained political power and now (ignoring the importance of perceived stability) whip up hysteria about 'budget deficits' and snow-balling 'government debt', demanding immediate reductions in government expenditure to [ensure 'balanced budgets'](#).

Paul Krugman describes it,

The doctrine of expansionary austerity - the proposition that cuts in government spending would actually cause higher growth despite their direct negative impact on demand, thanks to the confidence fairy...

But expansionary austerity was and is such a convenient doctrine politically that, like insistence on the magical effects of tax cuts, it has proved unkillable.

(Paul Krugman, [The Expansionary Austerity Zombie](#), *New York Times*, Opinion Pages, November, 20, 2015)

All-too-often, neoliberal ideologues (particularly those with an Ayn Rand bias) insist on the need for lower rates of taxation as essential for 'economic health' (Krugman's "magical effects of tax cuts" based on 1920s 'scientific taxation' arguments⁶⁸⁵).

Paul Krugman has summed up the long-running neoliberal fascination with what the first Bush, as a presidential candidate in 1982, aptly described as 'voodoo economics' (though, faced with working in a Reagan White House, he later denied that he had done so):

Almost four decades ago then-candidate George H.W. Bush used the phrase "voodoo economic policy" to describe Ronald Reagan's claim that cutting taxes for the rich would pay for itself. He was more prescient than he could have imagined.

For voodoo economics isn't just a doctrine based on magical thinking. It's the ultimate policy zombie, a belief that seemingly can't be killed by evidence. It has failed every time its proponents have tried to put it into practice, but it just keeps shambling along. In fact, at this point it has eaten the brains of every significant figure in the Republican Party. Even Susan Collins, the least right-wing G.O.P. senator (although that isn't saying much), insisted that the 2017 tax cut would actually reduce the deficit.

(Paul Krugman, [From Voodoo Economics to Evil-Eye Economics](#), *New York Times* Opinion, August 22, 2019)

Often, perversely, those not strongly infected with [Ayn Rand tautologies](#) argue for the [logic of reduced taxation but increased spending](#) (usually [focused on military expenditures](#), reliant, apparently, on those 'magical effects' of tax cuts) - which, of course, all-too-easily leads to private sector borrowing (usually [through issuing government bonds](#))⁶⁸⁶.

The underlying presumption which drives this is that all credit is (or, should be) created in the private marketplace: that sovereign governments should

not issue credit, since this, inevitably, increases 'government debt' which will, inevitably, result in increased taxation which will, inevitably, depress private economic activity.

And, of course, if governments borrow what they need from the private realm then (if one fails to understand that private banks *create* credit 'from thin air') "every dollar of increased government spending must correspond to one less dollar of private spending" - the "[intermediation of loanable funds \(ILF\) model of banking](#)" fallacy⁶⁸⁷.

As one true believer, John Cochrane, put it:

If the government borrows a dollar from you, that is a dollar that you do not spend, or that you do not lend to a company to spend on new investment. Every dollar of increased government spending must correspond to one less dollar of private spending. Jobs created by stimulus spending are offset by jobs lost from the decline in private spending. We can build roads instead of factories, but fiscal stimulus can't help us to build more of both....

The government should borrow to finance worthy projects, whose rate of return is greater than projects the private sector would undertake with the same money, spreading the taxes that pay for them over many years, after making sure its existing spending meets the same cost-benefit tradeoff. Just don't call it 'stimulus,' don't claim it will solve our current credit problems, 'create jobs' on net, or do anything to help the economy in the short run...

(John H. Cochrane, ^œ[Fiscal Stimulus, Fiscal Inflation, or Fiscal Fallacies?](#), Myron S. Scholes Professor of Finance, University of Chicago Booth School of Business, Version 2.5 Feb 27 2009)

To allay any suspicion that this was a carelessly written piece, unlikely to be representative of Cochrane's writing, he has obligingly recommitted his ideas to print in a *Wall Street Journal* essay entitled ^œ[Ending America's Slow-Growth Tailspin: The U.S. economy needs a dramatic legal and regulatory simplification](#) (WSJ, May 2, 2016 - behind a pay wall).

As Bill Black has suggested:

Don't try to search for Cochrane's logic, this is simple dogma and protection of his elite patrons...

When I criticize Mankiw and Cochrane I am not picking on obscure theoclassical economists, but rather what their movement considers its stars. The public has no idea how radical the views of these people are, how often and destructively their predictions and policies have failed, and how impervious their dogmas are to change when their predictions fail. The naked shilling for their elite patrons is the moldy cherry on their odious sundae.

(William K. Black, ^œ[Cochrane Proposes "Restoring the Rule of Law" by Letting CEOs Defraud with Impunity](#), *New Economic Perspectives*, May 18, 2016)

Yes, in capitalist societies economics and 'the economy' are the playground of secondary ideologies and magic formulae. All-too-often, 'very serious people' promote [cartoon capitalism](#), a realm in which simplistic reasoning and impenetrable logic enhance mystique!

Unquestionably, Cochrane, [like so many Western conservatives](#), is a true (and credulous) believer. He has unshakeable faith in the necessity for, and *Summum Bonum* consequences of, deregulated, self-correcting

internationalized free markets. His [objective reality](#) requires that they be defended against the evils of 'big government', 'public spending' and enterprise-destroying taxation at all costs. To paraphrase (and with apologies to) the apostle Paul:

...without faith it is impossible to please [the Free Market], because anyone who comes to [it] must believe that [it] exists and that [it] rewards those who earnestly seek [it]
([Hebrews Ch.11 V.6, NIV](#))

Cochrane's sophistic portrayal of the apparently non-existent private impact of public spending raises more questions than it could possibly answer, yet similar understandings are all-too-common in 21st century economic discourse.

The consequence, of course, is that since governments should not engage in profit-making activity; should minimize taxation; and should not create credit, they must engage in unsustainable private sector borrowing to fund their activities⁶⁸⁸ - which is why the Cochranes of this world have no hesitation in endorsing [Henry Thoreau's \(1849\) conclusion](#):

"That government is best which governs least"; and I should like to see it acted up to more rapidly and systematically. Carried out, it finally amounts to this, which also I believe, - "That government is best which governs not at all"; and when men are prepared for it, that will be the kind of government which they will have.

The logic of these approaches escapes me, but I grew up (and in my early years, was positively involved) in a strongly Pentecostal environment and am well aware that belief welcomes the non-rational in a world where the counter-intuitive reinforces faith. The apostle Paul explained the nature of faith in his Letter to the Hebrews:

Now faith is confidence in what we hope for and assurance about what we do not see.
(Hebrews Ch.11 V.1 New International Version)

How credit is generated

 (03/03/16) (04/03/16) (15/05/17) (11/08/17) (20/08/17) (28/11/17) (12/04/17) (03/03/18)
(01/04/20) (05/04/20) (06/07/20) (06/11/20) (15/11/20) (19/11/20)

The *issuer* of sovereign currencies and related forms of 'credit' or 'wealth' is government (however one wishes to define that term). In accounting terms, this process is usually recorded as a 'debit' in that government's accounts - which can, all-too-easily, but erroneously, be equated with a 'debt' which the government owes to itself or to 'the public', [as Alan Greenspan suggested](#).

Government 'debt' (in the form of sovereign credit creation - [which should fund the capitalist infrastructural commons](#)) is private wealth (wherever it is incurred/created). But, as [Beardsley Ruml explained](#), nobody is 'owed' anything as a consequence of its creation. A 1939 US Federal Reserve publication spelt it out

Federal Reserve Bank credit... does not consist of funds that the Reserve authorities "get" somewhere in order to lend, but constitutes funds that they are empowered to create.

Sovereign deficits resulting from credit creation are *not* debts which have to be 'repaid' and Budget Surpluses or Balanced Budgets are [not evidences of](#)

'responsible economic management': they are not virtues. However, none of this absolves governments from fiscal responsibility.

We are, of course, talking about the 'sovereign' level of government which controls the monetary base that underwrites private economic activity. Lower levels of government, which rely on access to credit in much the same way as private entities, should be subject to similar regulation and oversight by the controller of the monetary base ⁶⁸⁹.

Ideally, all levels of government are in complementary, symbiotic relationship and funding processes at the sovereign level should be available to lower levels of government, subject to necessary sovereign constraints. As Galbraith explained,

Governments and banks are the two entities with the power to create something from nothing. If total spending power is to grow, one or the other of these two great financial motors - public deficits or private loans - has to be in action.

Public spending (whether sovereign, regional, state or local in focus) should be publicly, not privately, funded and should be directed to those individuals (real or 'artificial') which deliver the services and infrastructure funded by government ⁶⁹⁰.

In 2020, in the grip of a worldwide Covid-19 crisis, with countries in 'lockdown' and economies in free-fall ⁶⁹¹, sovereign governments should not only underwrite non-sovereign levels of government, they should, using their sovereign credit creation powers, coupled with judicious redistributive processes, underwrite the incomes and livelihoods of all those living in fear of losing jobs and incomes.

If ever there was a God-given opportunity to reset Western communities/ economies/ polities to the requirements of a world facing environmental/ health/ social/ economic/ and military catastrophe, 2020 and the consequences of the Covid-19 crisis is one!

The question is whether Western peoples are up to the challenge. The opportunity has been presented, can the moment be seized to reshape the world or will we allow the *status quo* to persist into a Covid-19 future where the pursuit of endless profit, all-consuming lust after 'power', greed and uncontrolled consumptive appetites drive us toward disaster?

Bill Mitchell (in a discussion of 'explanations' of their activities offered by Reserve Bank of Australia [RBA] officials, entitled 'Memo: Right pocket to left pocket - don't let anyone know what is going on in these trousers') has neatly explained what the RBA should do in response to the State-level problems which have arisen in dealing with the 2020 Covid-19 support of Australian communities ⁶⁹²:

My recommendation is the RBA [Reserve Bank of Australia] should fund all state and territory government deficits for the foreseeable future to allow them to recover from the pandemic.

They should also buy all the federal government debt to allow them to get on with the business of creating jobs.

They should also pressure the federal government to introduce a large-scale job creation program to provide high-skill work to advance the shift away from carbon-intensive production.

And at the lower end of the labour market, the RBA should announce they will 100 per cent [fund] a Job Guarantee program and seek a partnership with the federal government to make that operational.

It could then announce it will fund 400,000 new social housing constructions to allow low-income families to enjoy the benefits of home ownership and take them out of the repressive rental market.

Sovereign governments have a [fiduciary responsibility](#) to ensure the wellbeing and livelihoods of all under their care - not just in times of crisis but *always*. Chief among their responsibilities should, inevitably, be the provision of unencumbered sovereign credit aimed at both underwriting and promoting the commonweal at all levels of government.

We are wont to describe Western capitalist nations as the 'developed' nations of the world but this belies reality.

Hidden from the view of the affluent (both by geographical location and by a myopic inability to see what is in plain sight) are legions of dispossessed, denigrated and despairing human beings.

And those governments, with the means readily available, still proclaim that the costs of addressing this disgrace are too high; that the 'government deficit' is already too large; that, anyway, if they really applied themselves they too could be among 'the advantaged'.

Martin Luther King expressed the consequences well: 'They find themselves perishing on a lonely island of poverty in the midst of a vast ocean of material prosperity'.

Liz Theoharis has addressed the US scene: one repeated to varying degree in most, if not all Western nations:

In the two weeks since Election 2020, the country has oscillated between joy and anger, hope and dread in an era of polarization sharpened by the forces of racism, nativism, and hate. Still, truth be told, though the divisive tone of this moment may only be sharpening, division in the United States of America is not a new phenomenon.

Over the past days, I've found myself returning to the words of Dr. Martin Luther King, Jr., who, in 1967, just a year before his own assassination, gave a speech prophetically entitled "The Other America" in which he vividly described a reality that feels all too of this moment rather than that one:

There are literally two Americas. One America is beautiful... and overflowing with the milk of prosperity and the honey of opportunity. This America is the habitat of millions of people who have food and material necessities for their bodies; and culture and education for their minds; and freedom and human dignity for their spirits...

But tragically and unfortunately, there is another America. This other America has a daily ugliness about it that constantly transforms the ebullientcy of hope into the fatigue of despair. In this America millions of work-starved men walk the streets daily in search for jobs that do not exist. In this America millions of people find themselves living in rat-infested, vermin-filled slums. In this America people are poor by the millions. They find themselves perishing on a lonely island of poverty in the midst of a vast ocean

of material prosperity.

(Martin Luther King, ^œ[The Other America](#), 1967, 1968)

In Dr. King's day, that other America was, for a time, laid bare to the nation through mass social unrest and political change, through the bold actions of the freedom fighters who won the Voting Rights Act and then just kept on fighting, as well as governmental programs like the "War on Poverty." And yet, despite the significant gains then, for many decades since, inequality in this country has been on the rise to previously unimaginable levels, while poverty remained locked in and largely ignored.

Today, in the early winter of an uncurbed pandemic and the economic crisis that accompanies it, there are 140 million poor or low-income Americans, disproportionately people of color, but reaching into every community in this country: 24 million Blacks, 38 million Latinos, eight million Asians, two million Native peoples, and 66 million whites.

More than a third of the potential electorate, in other words, has been relegated to poverty and precariousness and yet how little of the political discourse in recent elections was directed at those who were poor or one storm, fire, job loss, eviction, or healthcare crisis away from poverty and economic chaos.

In the distorted mirror of public policy, those 140 million people have remained essentially invisible. As in the 1960s and other times in our history, however, the poor are no longer waiting for recognition from Washington. Instead, every indication is that they're beginning to organize themselves, taking decisive action to alter the scales of political power.

(Liz Theoharis, ^œ[The Other America: The New Politics of the Poor in Joe Biden's \(and Mitch McConnell's\) USA](#), *TomDispatch*, November 17, 2020.

^œ[Reproduced, with comments on the *NakedCapitalism* site](#))

Newton Finn, in an insightful comment on a ^œ[Bill Mitchell blog](#) posting has asked:

...[H]ow many are working part-time jobs, temp jobs, gig jobs, independent contractor jobs, on-call jobs, etc., ...how many are working more than one such job or are compelled to work well past retirement age, all in a desperate effort to make ends meet...?.

Such conditions *do not have to exist*. They are a consequence of [inadequate government labor policies and regulations](#) in support of vulnerable people.

One can but hope that sovereign governments, both in the 2020 time of crisis and in its aftermath, will realize and act upon the understanding that [the only limitations on the funding of the credit requirements](#) of both private economic activity and public commons institutions, processes and activities are those of:

➤ *Resource availability;*

and

➤ The will of government to take responsibility for maintaining economic stability through *well-crafted taxation policies* which remove excess credit from the economy when it has fulfilled its varied purposes. Inevitably, this will require removing surplus

credit from extreme accumulations of credit within the private realm.

The most certain means of stimulating the real economy is *not* by channeling sovereign credit into the banking system - that tends to be absorbed by the financial institutions and diverted into any of a variety of financial activities designed to grow bank profits, not the real economy.

Rather, public spending should flow directly into the real economy⁶⁹³.

Banks will benefit through the normal processes of private economic activity as that government spending takes effect. Private financial institutions such as banks should provide financial services *within* the private sector, not be conduits of public credit to the private sector.

Inevitably, financial institutions will loudly protest that government spending should be channeled through them. However, we should remember Galbraith's explanation of the value of government spending in the private sector: "Ordinary people benefit, but there is nothing in it for banks".

The sovereign level of government in a democratic society *should be responsible for ensuring the wellbeing of lower levels of government*.

In a [bottom-up democracy](#), most of the local and regional services will be in the hands of local and regional authorities. However, the only branch of government that is able to create credit as required is the sovereign level of government.

So, if ongoing credit support is not provided by the sovereign level of government, in any general downturn of the economy, local and regional authorities are left to the tender mercies of private sector generators of credit to cover fluctuations in costs of services: Governmental welfare services are more costly in economic downturns and less costly in times of economic prosperity.

Responsible symbiotic relationships between various levels of government become essential to ensure that non-sovereign levels of government do not become increasingly indebted to private sector financial institutions through being required, whenever there is a downturn, to turn to them for support.

In a truly symbiotic governmental system, there should *never* be a situation where local and regional authorities must issue 'bonds' in order to raise credit for necessary services.

Without sovereign government support, lower levels of government are left in the unenviable position of having to scale back community support services in times of economic downturn. The alternative is to become increasingly indebted to the private sector. This ensures that, as illustrated below, when economic prosperity returns they are left with inflated borrowings and payments to private sector financial institutions. These, inevitably, continue to hobble those services in good times and prevent the buildup of resources for future downturns.

The only reasonable solution to all this is for the sovereign level of government to provide *institutionalized* necessary [credit support on a non-profit basis to lower levels of government](#) when they need it.

In the absence of adequate sovereign funding support, lower levels of government need to find alternative, sustainable, funding sources. Sarah Anderson and Chuck Collins have canvased a number of these in an article

entitled 'How to Reduce Poverty and Inequality Through State Government Taxes'. As they explain:

New progressive taxes are needed at the state level to generate much-needed revenue for anti-poverty programs while also curbing the excessive power the wealthiest 1% currently hold over our political system. Case in point: the new federal tax law that will lower taxes on the wealthy, despite majority support among U.S. taxpayers for substantial taxes on the rich. And while opponents will no doubt argue the contrary, a joint Stanford University-Treasury Department report shows that high taxes do not drive millionaires to move across state lines.

Here is a menu of some of the most promising options:

- Taxes on High-income Earners...;
- State Estate Taxation...;
- Tax on Companies With Extreme Gaps Between CEO and Worker Pay...;
- High-end Real Estate Taxes to Fund Affordable Housing and Other Priorities...;
- Carried Interest Tax...;
- Financial Transaction Tax...;
- Capital Gains Tax...;
- Luxury Taxes...;

and

- State Payroll Tax On High Incomes...;
(Sarah Anderson and Chuck Collins, [How to Reduce Poverty and Inequality Through State Government Taxes](#), *Inequality*, Blogging Our Great Divide, March 02, 2018)

Yes, there are alternatives to issuing government 'bonds', raising necessary revenue through borrowing from the private sector. Though, of course, in this absurd neoliberal age in which so many of the 'authoritative' voices are beholden to those whose 'wealth' is enhanced by reducing, not increasing, taxation, these means of generating public revenue will be vehemently opposed.

When governments (at whatever level) fund activity through private borrowing (or even through contracting financial institutions to act as funding intermediaries) they can, all-too-easily, find themselves with exorbitant debt servicing costs which cripple their ability to provide necessary public services. Effectively, financial institutions can [impose a 'tax' on government credit](#) channeled into the real economy.⁶⁹⁴

Though logically unnecessary (and of dubious value to the real economy), this is [a common predicament](#) in which state and local authorities far too often find themselves. David Sirota has illustrated the problem:

When a city is forced to spend more on Wall Street fees than on basic public services, it is the sign of trouble. When that city is one of America's biggest population centers, it is the sign of a burgeoning crisis.

That's the key takeaway from ^œ[a recent report](#) looking at what has been happening in Los Angeles over the last few years. Published by the union-backed Fix LA Coalition, the report details how the city has slashed its spending in the wake of revenue losses from the Wall Street-engineered financial crisis. Yet, as the analysis shows, the city is nonetheless still being crushed by Wall Street - in this specific case, it is being forced to spend \$300 million a year on financial fees. For some context, that's more than the city spends each year maintaining all of its roads.

(^œ[How Wall Street Financial Fees Choke Our Cities](#): L.A. is on the hook for millions of dollars in the same scheme that has plagued cities across America (*In These Times*, May 9, 2014).)⁶⁹⁵

The Relation Between Government Debt and Private Wealth

 (02/04/16)(24/10/16) (04/05/17)

The use of the term 'debt' to describe the creation/distribution of sovereign credit is unfortunate since it [leads to confusion](#) between this fundamentally creative role of government in wealth generation and economic stimulus and private spending which is the [dissipation](#) of credit.

There is, and historically has been, an apparent confusion in the minds of many US (and other Western government) legislators as to the nature of 'government deficits' and 'government debt'. Using a simplistic presumption that 'household budgets' (and/or 'business budgets') and 'government budgets' are analogous⁶⁹⁶, they have argued that government debt should be eliminated or reduced to as low a level as possible⁶⁹⁷.

As [Margaret Thatcher explained](#):

...[S]omeone has to add up the figures. Every business has to do it, every housewife has to do it, every Government should do it, and this one will.

In the attempt they have, inevitably, withdrawn credit from their economies, starving them of the funds needed to ensure economic wellbeing.

As Paul Samuelson put it in an interview with Mark Blaug⁶⁹⁸ :

I think there is an element of truth in the view that the superstition that the budget must be balanced at all times [is necessary]. Once it is debunked [that] takes away one of the bulwarks that every society must have against expenditure out of control.

There must be discipline in the allocation of resources or you will have anarchistic chaos and inefficiency. And one of the functions of old fashioned religion was to scare people by sometimes what might be regarded as myths into behaving in a way that the long-run civilized life requires.

We have taken away a belief in the intrinsic necessity of balancing the budget if not in every year, [then] in every short period of time. If Prime Minister Gladstone came back to life he would say "uh, oh what you have done?"...

(Bruce Bartlett, ^œ[A Balanced Budget: Worthy Superstition?](#), CapitalGainsandGames.com, 30 April 2010)

Far too many Western politicians (and economists) now believe that the superstition is reality. So, they set about reordering reality to the

requirements of the myth their progenitors contrived, irrationally insisting on an "intrinsic necessity of balancing the budget"⁶⁹⁹.

Frederick Thayer (1996) provided a description and explanation of the historical relation between government debt and private wealth in the United States:

Since 1791, the earliest data available, the national debt has been increased in 112 years, decreased in 93 years. 57 of those balanced-budget, debt-reduction years have been concentrated in six sustained periods of varying length. Also since 1791, there have been six significant economic depressions among the innumerable "business cycles." Each sustained period of budget-balancing was immediately followed by a significant depression. There are as yet no exceptions to this historical pattern.

This is the record of six depressions:

- 1.1817-21: in five years, the national debt was reduced by 29 percent, to \$90 million. A depression began in 1819.
- 2.1823-36: in 14 years, the debt was reduced by 99.7 percent, to \$38,000. A depression began in 1837.
- 3.1852-57: in six years, the debt was reduced by 59 percent, to \$28.7 million. A depression began in 1857.
- 4.1867-73: in seven years, the debt was reduced by 27 percent, to \$2.2 billion. A depression began in 1873.
- 5.1880-93: in 14 years, the debt was reduced by 57 percent, to \$1 billion. A depression began in 1893.
- 6.1920-30: in 11 years, the debt was reduced by 36 percent, to \$16.2 billion. A depression began in 1929.

There has been no sustained period of budget-balancing since 1920-30, and no new depression, the longest such period in our history.

The question is whether this consistent pattern of balance the budget-reduce the national debt-have a big depression is anything other than a set of coincidences. According to economic myths, none of these sequences should have occurred at all. How on earth, for example, could we virtually wipe out the national debt in the mid-1830s, then fall immediately into one of the six recognized collapses in our history? Those who write about the desirability of reducing the national debt frequently praise Andrew Jackson for his vigorous pursuit of such a goal, but do not mention "depression" in the same breath. It is helpful to the maintenance of economic myth to say little about depressions in textbooks, thus making it easy to avoid looking at connections considered impossible anyway.

(Thayer, Frederick C., ⁶⁹⁹[Balanced Budgets and Depressions](#), *The American Journal of Economics and Sociology*, April 1996)

Regulation of Private Credit Creation

Of course, all this assumes effective regulation of *private* credit creation. Banks and similar credit facilitating entities [lend and trade on the basis of an assumption of 'credit-worthiness'](#) (that is, a presumption of either government-guaranteed collateral security or sufficient 'equity' - similarly backed, accumulated and 'congealed' credit (aka 'assets') - to cover their

commitments). They are, therefore, able to *create* credit to the extent that those with whom they deal believe in their ability to cover their commitments and the extent to which 'regulatory capital adequacy requirements'⁷⁰⁰ are effective (see [here for further explanation](#)).

James Galbraith (2010) has provided a clear explanation of some of the key differences between public deficit spending and private bank lending:

...the deficit phobia of Wall Street, the press, some economists and practically all politicians is one of the deepest dangers that we face. It's not just the old and the sick who are threatened; we all are. To cut current deficits without first rebuilding the economic engine of the private credit system is a sure path to stagnation, to a double-dip recession - even to a second Great Depression. To focus obsessively on cutting future deficits is also a path that will obstruct, not assist, what we need to do to re-establish strong growth and high employment.

To put things crudely, there are two ways to get the increase in total spending that we call "economic growth." One way is for government to spend. The other is for banks to lend. Leaving aside short-term adjustments like increased net exports or financial innovation, that's basically all there is. Governments and banks are the two entities with the power to create something from nothing. If total spending power is to grow, one or the other of these two great financial motors - public deficits or private loans - has to be in action.

For ordinary people, public budget deficits, despite their bad reputation, are much better than private loans. Deficits put money in private pockets. Private households get more cash. They own that cash free and clear, and they can spend it as they like. If they wish, they can also convert it into interest-earning government bonds or they can repay their debts. This is called an increase in "net financial wealth." Ordinary people benefit, but there is nothing in it for banks.

And this, in the simplest terms, explains the deficit phobia of Wall Street, the corporate media and the right-wing economists. Bankers don't like budget deficits because they compete with bank loans as a source of growth. When a bank makes a loan, cash balances in private hands also go up. But now the cash is not owned free and clear. There is a contractual obligation to pay interest and to repay principal. If the enterprise defaults, there may be an asset left over - a house or factory or company - that will then become the property of the bank. It's easy to see why bankers love private credit but hate public deficits. (James K. Galbraith, ^œ[In Defense of Deficits: A big deficit-reduction program would destroy the economy two years into the Great Crisis](#), *The Nation*, March 22, 2010)

As Dan Kervick has explained,

...Due to a combination of deliberate policy choices and historical contingencies, societies have chosen to institute complex monetary and credit systems in which the generation of the most commonly used means of exchange is primarily a market-driven phenomenon, but one that is heavily regulated and supplemented by government agencies that also issue their own forms of money.

We can also note that those latter forms of narrow government money usually play a foundational role in constraining and underpinning the broader forms of money, since they are needed to settle the

obligations that are incurred by issuing those broader forms of money.
(^œ[Hyper-Endogeneity](#), *New Economic Perspectives*, August 30, 2013)

In bubble-promoting economic conditions, where regulatory capital adequacy requirements are weak or ineffective, the perceived inflation in the 'value' of whatever is driving the inflating bubble becomes the guarantee of private lenders' ability to cover their commitments, enabling increasingly unchecked growth of unsecured credit. As Robert Shiller put it:

A "speculative bubble,"... is "a situation in which news of price increases spurs investor enthusiasm, which spreads by psychological contagion from person to person, in the process amplifying stories that might justify the price increase." This attracts "a larger and larger class of investors, who, despite doubts about the real value of the investment, are drawn to it partly through envy of others' successes and partly through a gambler's excitement."

That seems to be the core of the meaning of the word as it is most consistently used. Implicit in this definition is a suggestion about why it is so difficult for "smart money" to profit by betting against bubbles: the psychological contagion promotes a mindset that justifies the price increases, so that participation in the bubble might be called almost rational. But it is not rational.

(Robert J. Shiller, ^œ[Bubbles Forever](#), *Project Syndicate*, Jul. 17, 2013)
(See Charles Mackay (1852), *Memoirs of Extraordinary Popular Delusions*, for a description of bubbles and their consequences in 18th and 19th century Western Europe)

John Kay has provided a delightful article dealing with some of the features of bubble blowing. As he says,

Embezzlement, Galbraith observed, has the property that "weeks, months, or years elapse between the commission of the crime and its discovery. This is the period, incidentally, when the embezzler has his gain and the man who has been embezzled feels no loss. There is a net increase in psychic wealth." Galbraith described that increase in wealth as "the bezzle."

(John Kay, ^œ[The Bezzle Years](#), *Project Syndicate*, October 7, 2015)

A prime responsibility of regulators of credit supply is to ensure that unsecured-credit-creating entities have sufficient reserves to cover their commitments should they need to do so. In a deregulated world it becomes easier for private banks and similar financial entities to effectively subsume the role of government and issue their own credit with little or no government-guaranteed collateral security.

In the short run, as found in the 1920s and again in the 1980s, this can appear to result in economic growth and wealth creation (the 'bezzle'), giving credence to the naive claims of free-marketeers and fellow travelers that deregulation leads to economic growth and wellbeing.

However, the unchecked growth of credit with [inadequate regulatory oversight](#) and/or government-guaranteed collateral security leads, inevitably, to an over-supply of credit with all the consequent problems of over-supply - as we all found to our cost in the post-2007 global financial crisis. Robert Skidelsky has succinctly described the consequences:

We all know how the global economic crisis began. The banks over-lent to the housing market. The subsequent burst of the housing bubble in the United States caused banks to fail, because banking had gone

global and the big banks held one another's bad loans. Banking failure caused a credit crunch. Lending dried up and economies started shrinking.

So governments bailed out banks and economies, producing a [sovereign debt](#) crisis. With everyone busy deleveraging, economies failed to recover. Much of the world, especially Europe, but also the slightly less sickly US, remains stuck in a semi-slump.

(^œ[Economic Rebalancing Acts](#), *Project Syndicate*, Jun. 30, 2013)

How unfortunate that those responsible for this pathological proliferation of unsecured credit should then be rewarded by being handed the government credit needed to legitimize their unsecured extravagances because their behavior had made them 'too-big-to-fail' - confirming the widely held belief that governments bail out big banks.⁷⁰¹

Governments Bail Out Big Banks 🇺🇸

 (18/02/16) (14/01/16) (21/04/16) (16/02/16) (29/08/18) (01/09/18) (08/09/18) (25/10/18)
(03/10/20) (03/12/20) (30/03/21) (15/09/21)

This is a [tale of two worlds](#): of a parasitic world of 'high finance' and of a gutted and parasitized industrial world. It is a tale of missed opportunities; of Obama's meaningless chants of 'Yes We Can'⁷⁰²: devoid of vision, devoid of a 'New Deal'; of [pigs at a trough](#) and their facilitators; and of those who saw the problems but devised no solutions, promoted no vision of a Western future which would, once again, be focused on government 'of the people, by the people, for the people' and have dismissed the visions of others as '[impossible dreams](#)'.

This is a tale of people in positions of authority and power and 'experts', who [lacked a vision of the possible](#) and [had a vested interest](#) in maintaining the *status quo*.

In a 2018 self-congratulatory essay, the chief US architects of the 2008 Global Financial Crisis (GFC) 'solutions', which steered politicians away from 'New Deal' policies and toward a massive bailout of the primary culprits of the crisis, argue for ensuring that their 'solutions' should be enshrined in law as means of dealing with the inevitable next crisis⁷⁰³:

Many of the actions necessary to stem the crisis, including the provision of loans and capital to financial institutions, were controversial and unpopular. To us, as to the public, the responses often seemed unjust, helping some of the very people and firms who had caused the damage. Those reactions are completely understandable, particularly since the economic pain from the panic was devastating for many.

The paradox of any financial crisis is that the policies necessary to stop it are always politically unpopular. But if that unpopularity delays or prevents a strong response, the costs to the economy become greater. We need to make sure that future generations of financial firefighters have the emergency powers they need to prevent the next fire from becoming a conflagration. We must also resist calls to eliminate safeguards as the memory of the crisis fades. For those working to keep our financial system resilient, the enemy is forgetting.

(Ben S. Bernanke, Timothy F. Geithner and Henry M. Paulson Jr.,

^œ[What We Need to Fight the Next Financial Crisis: Congress has taken away some of the tools that were crucial to us during the 2008 panic. It's time to bring them back](#), *New York Times*, September 7, 2018)

As they say, the enemy is, indeed, forgetting: how an opportunity to reset the burgeoning inequality of the previous forty years was squandered and the diversion of wealth to the very richest was entrenched⁷⁰⁴. [Saez and Zucman](#) explained:

Wealth inequality has considerably increased at the top over the last three decades. By our estimates, almost all of this increase is due to the rise of the share of wealth owned by the 0.1% richest families, from 7% in 1978 to 22% in 2012, a level comparable to that of the early twentieth century.

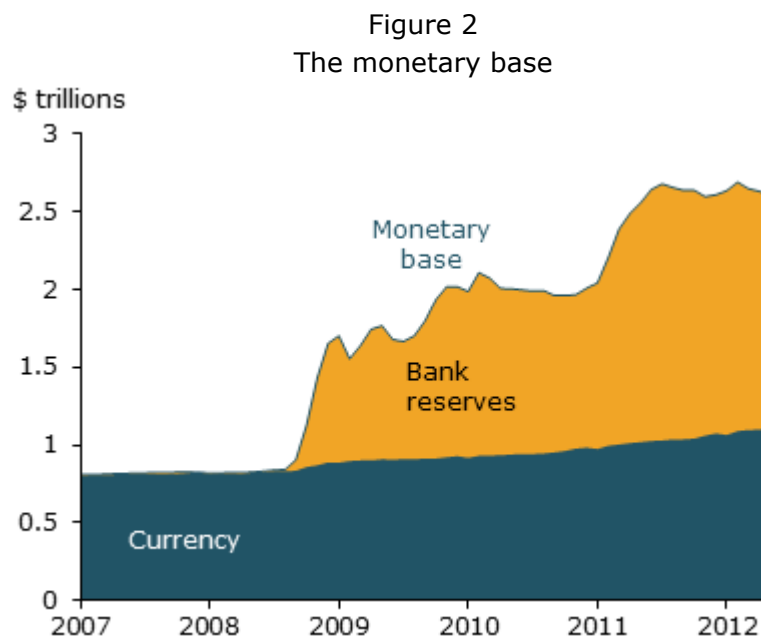

It is a tale which reaffirms a 2500 year old aphorism:

Where there is no vision, the people perish
(^œ[Proverbs 29:18](#) (King James Version of Bible))

Where was the true champion of 'The People', the visionary Western politician with a new vision of a 'New Deal' future, in the early 21st century?

As ^œ[Yellen \(2007\)](#), describing east Asian experience in the late 1990s, put it, there was "a perception that the governments of these nations stood ready to intervene to forestall bank failures".

John Williams (CEO, Federal Reserve Bank of San Francisco) provided a graphic illustration of what happened in response to the 2007-9 banking crisis in the US:

As he explained:

The monetary base is the sum of U.S. currency in circulation and bank reserves held at the Federal Reserve. Figure 2 shows the key components of the monetary base since 2007. Up until late 2008, it consisted mostly of currency, with a small amount of bank reserves held mostly to meet regulatory requirements. Since then, the monetary base has risen dramatically, primarily because of a \$1.5 trillion increase in bank reserves...

But, once the economy improves sufficiently, won't banks start lending more actively, causing the historical money multiplier to reassert itself? And can't the resulting huge increase in the money supply overheat the economy, leading to higher inflation? The answer to these questions is

no, and the reason is a profound, but largely unappreciated change in the inner workings of monetary policy.

The change is that the Fed now pays interest on reserves. The opportunity cost of holding reserves is now the difference between the federal funds rate and the interest rate on reserves...

As a result, in a world where the Fed pays interest on bank reserves, traditional theories that tell of a mechanical link between reserves, money supply, and, ultimately, inflation are no longer valid. In particular, the world changes if the Fed is willing to pay a high enough interest rate on reserves. In that case, the quantity of reserves held by U.S. banks could be extremely large and have only small effects on, say, the money stock, bank lending, or inflation.

(John C. Williams, ^œ[Monetary Policy, Money, and Inflation](#), FRBSF Economic Letter, July 9, 2012)

(See these graphs for [US monetary base expansion from 1984 to 2013](#).)

Mariana Mazzucato, in a *Foreign Affairs* article entitled ^œ[Capitalism After the Pandemic: Getting the Recovery Right](#) (October 02, 2020), explained what happened:

After the 2008 financial crisis, governments across the world injected over \$3 trillion into the financial system. The goal was to unfreeze credit markets and get the global economy working again. But instead of supporting the real economy - the part that involves the production of actual goods and services - the bulk of the aid ended up in the financial sector. Governments bailed out the big investment banks that had directly contributed to the crisis, and when the economy got going again, it was those companies that reaped the rewards of the recovery. Taxpayers, for their part, were left with a global economy that was just as broken, unequal, and carbon-intensive as before. "Never let a good crisis go to waste," goes a popular policymaking maxim. But that is exactly what happened.⁷⁰⁵

John Talbot provided a speculative explanation of the significance of the ongoing increase in US bank reserves:

... back in 2008, Hank Paulson, our treasury secretary at the time, convinced Congress over a weekend that he needed \$700 billion of TARP [Troubled Asset Relief Program] funds to get the toxic assets off our commercial banks' books. Amazingly, within weeks of being given the funds by Congress, Paulson decided not to proceed with the purchase of toxic assets from the banks, instead giving away hundreds of billions of dollars to the commercial and investment banks and funding a series of bailouts - giving money to Chrysler, General Motors and AIG (some of which immediately found its way back to the commercial and investment banking community).

... I believe the reason Paulson didn't pursue his original toxic-asset purchasing plan is because such a purchase would have created a market price for these assets, and then all of the banks would have had to mark their poor-quality assets to this low market price. This would have resulted in the bankruptcy of almost all the major commercial and investment banks, because their leverage was so high that they couldn't withstand such a hit to their equity.

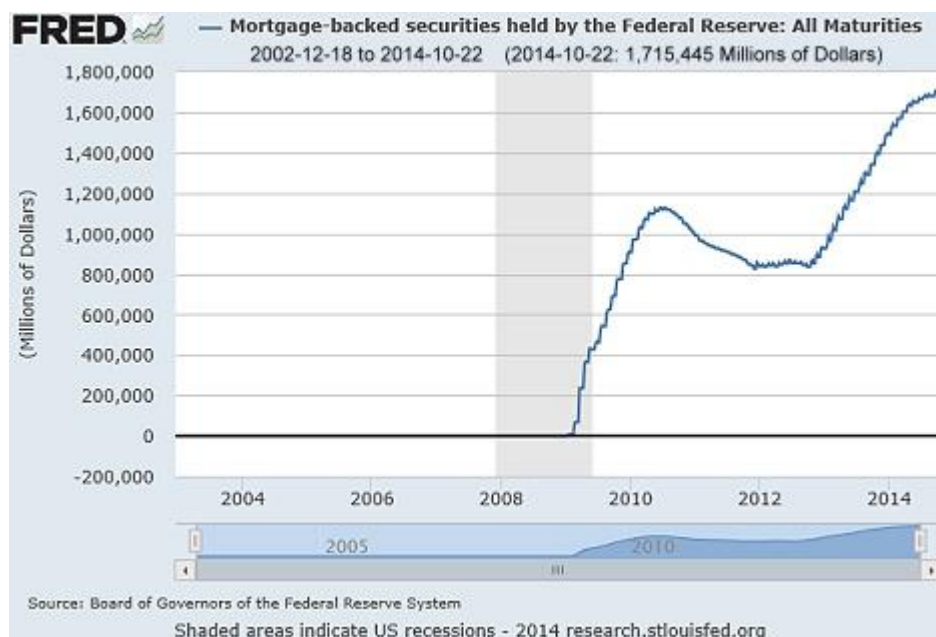

... What I believe the Fed did next was fraudulent and deceitful, its full impact still hidden from the American public, who want bank reform.

The Fed, I am convinced, went to these commercial banks and offered to take many of their toxic mortgage assets off their books, often accepting them as collateral for loans to the banks. In exchange, the Fed credited the commercial banks with an increase in the reserves held at the Fed, so long as the banks agreed not to withdraw the excess reserves immediately. Magically, the Fed was able to take a bad asset like a CDO [^œ[collateralized debt obligation](#)] and transform it into a sparkling good asset: bank reserves at the Fed.

(John R. Talbott, ^œ[The trillion-dollar fraud](#), *Salon*, May 2, 2010)

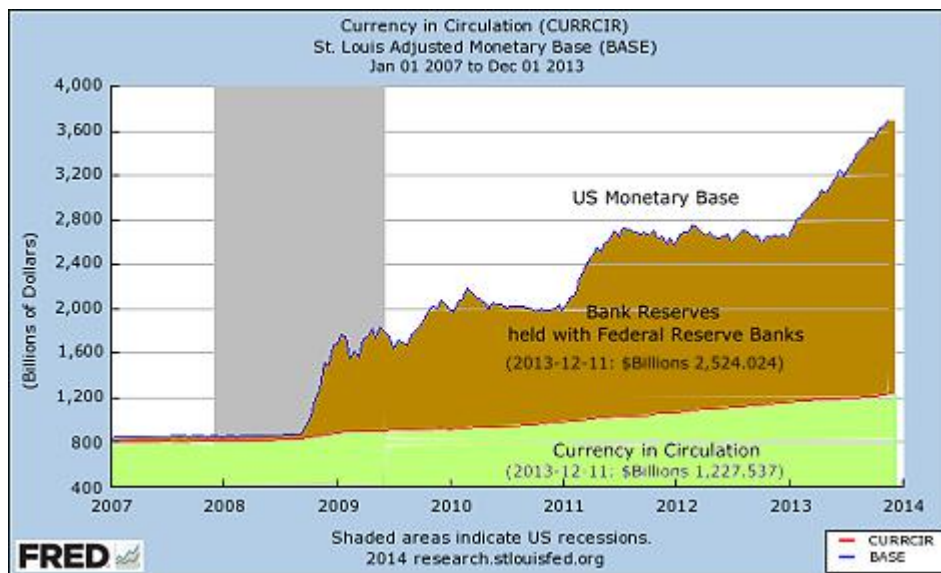

The US Federal Reserve effectively legitimized the [extraordinarily profligate behavior of the too-big-to-fail banks](#) by taking some of their greatest consequent liabilities and transforming them into 'sparkling good assets': bank reserves at the Fed - albeit as 'collateral for loans' which were later repaid ⁷⁰⁶.

Concurrently, as shown in the graph below, the Fed purchased longer-term securities⁷⁰⁷ from its ^œ[designated Primary Dealers](#) (in the US, the major 'too-big-to-fail' banks), paid for by creating bank reserves (converting the unsecured-credit created by banks to fund their acquisitions into interest-earning, government-guaranteed bank reserves ([legitimizing further unsecured-credit creation](#)) and, in the process, insulating those institutions from the vagaries of an uncertain market-place⁷⁰⁸).

In the process they vastly expanded those banks' federal bank reserves, giving them a license to create credit with few, if any Federal Bank checks on their activities.

Bank reserves held with Federal Reserve Banks (in billions of dollars) from January 01 2007 to December 01 2013

There is, indeed, nothing new under the sun. Abraham Lincoln, in a speech to the Illinois legislature, Jan. 1837:

These capitalists generally act harmoniously and in concert to fleece the people, and now that they have got into a quarrel with themselves, we are called upon to appropriate the people's money to settle the quarrel.

(^œ[Speech to Illinois legislature](#), Jan. 1837. See Vol. 1, p. 24 of *Complete Works of Abraham Lincoln*, ed. by Nicolay and Hay (New York: F.D. Tandy Co., 1905))

Joseph Stiglitz has given a post-2008 Global Financial Crisis version of this⁷⁰⁹:

...Those responsible for managing the 2008 recovery (the same individuals bearing culpability for the under-regulation of the economy in its pre-crisis days, to whom President Barack Obama inexplicably turned to fix what they had helped break) found the idea of secular stagnation attractive, because it explained their failures to achieve a quick, robust recovery. So, as the economy languished, the idea was revived: Don't blame us, its promoters implied, we're doing what we can....

...[T]here is nothing that inherently prevents our economy from being run in a way that ensures full employment and shared prosperity [my emphasis]. Secular stagnation was just an excuse for flawed economic policies. Unless and until the selfishness and myopia that define our politics - especially in the US under Trump and his Republican enablers - is overcome, an economy that serves the many, rather than the few, will remain an impossible dream.

There is [little need for these 'too-big-to-fail' banks to draw-down](#) excess bank reserves⁷¹⁰. They are, after all, not only receiving a guaranteed interest return on those holdings from the Fed but are able to create credit to the extent that those with whom they deal believe in their ability to cover their commitments⁷¹¹. In this new climate of excess bank reserves, ^œ['regulatory capital adequacy requirements'](#) are irrelevant.

Given the [close ties which exist](#) between many Federal Reserve Bank senior staff and the major banks, it would be interesting to know whether they were aware of the likely consequences of their actions. (It would be, ^œ[as Krugman puts it](#), ^œ['surprising, and a bit dismaying'](#), given their assumed expertise, if they were not!)⁷¹²

It is time to comprehensively re-regulate economies, insulating them from the corrosive consequences of [hyperglobalization](#). Any deployment of idle bank reserves in stimulating real economic activity will otherwise be sabotaged by 'the fragmentation of manufacturing across borders - the famous slicing up of the value-added chain - as individual production stages are located where the costs of production are lowest.'⁷¹³

Not only is it essential that we re-regulate to protect internal productive activity, job creation and wage rates; it is equally important to [claw back bank reserves](#) to bring them into line with long-established requirements. If this is not achieved the effect will, over time, be similar to enhanced bank deregulation. (There is more than one way to skin a cat - apologies to cat lovers! One can drive for deregulation and/or one can emasculate regulators by inflating bank reserves, making their levers decreasingly effective.)

The banks, of course, are less likely to 'fail', but they are more, not less, likely to use their new-found power to manipulate markets and concentrate the control of credit in their own hands. Without such claw-back, the US 'Fed' will have effectively [abdicated responsibility for credit creation and redistribution to the too-big-to-fail banks](#), their private equity partners and 'alternative asset managers'⁷¹⁴. Gillian Tett has highlighted this problem (addressed in the [1934 Pecora Commission report](#) and regulated through the associated legislation):

The US Office of the Comptroller of the Currency recently warned that the activities of non-banks has fuelled a boom in risky corporate loans - and warned banks not to "skirt rules" by teaming up with non-banks to create more credit.

(Gillian Tett, ^œ[The real titans of finance are no longer in the banks](#), *Financial Times*, February 13, 2014)

As Barry Eichengreen says:

Central banks should focus on developing more effective macro-prudential instruments. They should widen the regulatory perimeter - that is, they should work to bring nonbank financial institutions under their regulatory umbrella. They should use the resulting instruments and powers preemptively.

(Barry Eichengreen, ^œ[Leaners of Last Resort](#), *Project Syndicate*, 11 June 2014)

Bank reserves, at unprecedented levels, are not being employed to fund development in the mundane economy of material production and consumption. Instead, they provide interest-bearing, government-guaranteed collateral security for ^œ[vortex economic activity](#). The casino style behavior of players in the emergent realm of internationalized electronic wealth manipulation, relocation, redistribution and accumulation is now backed by interest-bearing 'bank reserves at the Fed'. Keynes warned of the dangers of the [casino capitalism](#) that wreaked havoc in the 1920s and 1930s:

... the position is serious when enterprise becomes the bubble on a whirlpool of speculation. When the capital development of a country becomes a by-product of the activities of a casino, the job is likely to be ill-done.⁷¹⁵

Klaus Schwab has described the consequences:

The Fed's QE policy, and variants of it elsewhere, have caused the major central banks' balance sheets to expand dramatically (from \$5-6

trillion prior to the crisis to almost \$20 trillion now), causing financial markets to become addicted to easy money. This has led, in turn, to a global search for yield, artificial asset-price inflation, and misallocation of capital.

(Klaus Schwab, ^œ[The Global Economy in 2014](#), *Project Syndicate*, Jan 6, 2014)

Gerald Epstein and Juan Antonio Montecino summed up the consequences for the US well. The resulting dysfunctions have seriously affected both people and productive economies throughout the world:

A healthy financial system is one that channels finance to productive investment, helps families save for and finance big expenses such as higher education and retirement, provides products such as insurance to help reduce risk, creates sufficient amounts of useful liquidity, runs an efficient payments mechanism, and generates financial innovations to do all these useful things more cheaply and effectively.

All of these functions are crucial to a stable and productive market economy. But after decades of deregulation, the current U.S. financial system has evolved into a highly speculative system that has failed rather spectacularly at performing these critical tasks.

What has this flawed financial system cost the U.S. economy?

How much have American families, taxpayers, and businesses been "overcharged" as a result of these questionable financial activities?

In this report, we estimate these costs by analyzing three components: (1) rents, or excess profits; (2) misallocation costs, or the price of diverting resources away from non-financial activities; and (3) crisis costs, meaning the cost of the 2008 financial crisis. Adding these together, we estimate that the financial system will impose an excess cost of as much as **\$22.7 trillion between 1990 and 2023**, making finance in its current form a net drag on the American economy....

The financial crisis of 2007-2008, whose massive costs are still being felt in many parts of the country, made clear to most Americans that the financial system is broken and needs serious reconstructive surgery. It has also become apparent that the dysfunctions of finance go far beyond the dramatic crashes; even when the system seems to be operating "normally," it costs most of us dearly on a daily basis and puts the long-term prosperity of our economy at risk.

These dysfunctions involve overcharging for brokerage services, predatory lending, and generally charging high fees for financial services; misallocating human talent from productive employment in technology, education, and health care to less socially productive employment; reorienting non-financial corporate behavior from longterm investment to short-term speculation that costs jobs, wages, and productivity growth; and choosing poor investments that put people's retirement incomes at risk.

The flip side of this coin is that a relatively small number of owners and operatives in the financial sector make significant salaries, bonuses, and profits as a result of these practices. Yet finance does not simply create a zero sum game that transfers income and wealth from customers to bankers and bank owners. It is worse than that: The destructive aspects of finance also negatively affect the overall health of the economy, both in the short run and in the long run.

That is, finance has operated in recent years as a negative sum game. This means that it costs us more than a dollar to transfer a dollar of wealth to financiers - significantly more. So even if you think our financiers deserve every penny they get, it would be a lot cheaper simply to write them a check every year than to let them continue business as usual.

(Gerald Epstein and Juan Antonio Montecino, *Overcharged: The High Cost of High Finance*, Roosevelt Institute, Pp. 2-4, July 2016)

Blowing Bubbles 🐘

(07/05/18) (17/11/18) (19/11/18) (14/05/19) (30/07/19)

The dramatic expansion in central banks' balance sheets after 2008 ensured financial institutions access to [trillions of dollars in bank reserves](#). As a result, the too-big-to-fail banks, their private equity partners and 'alternative asset managers' were handed unprecedented power to fund bubbles to their short-term advantage (ensuring, of course, that borrowers' collateral is real, secure, transferable and discounted ⁷¹⁶) - making that 4-fold increase in the monetary base between October 2007 and October 2015 a gift that, for those too-big-to-fail banks, keeps on giving!

Michael Hudson has spelt out the bottom line of predatory capitalism:

The big economic question is - and has always been - what will happen if debts cannot be paid? Will there be a debt writedown in favor of debtors (as has been done for large corporations), or will creditors be allowed to foreclose (as is always done on personal debtors and mortgage-holders), leading to their political takeover of the assets of the economy - and the government's public sector?

(Michael Hudson, ^œ[...and Forgive Them Their Debts](#), August 13, 2018)

Tobias Adrian, Fabio Natalucci, and Thomas Piontek have described the 2018 growth of predatory lending in the United States. As they say, 'with interest rates extremely low for years and with ample money flowing through the financial system, yield-hungry investors are tolerating ever-higher levels of risk and betting on financial instruments that, in less speculative times, they might sensibly shun':

We warned in the most recent ^œ[Global Financial Stability Report](#) that speculative excesses in some financial markets may be approaching a threatening level. For evidence, look no further than the \$1.3 trillion global market for so-called leverage loans, which has some analysts and academics sounding the alarm on a dangerous deterioration in lending standards. They have a point.

This growing segment of the financial world involves loans, usually arranged by a syndicate of banks, to companies that are heavily indebted or have weak credit ratings. These loans are called "leveraged" because the ratio of the borrower's debt to assets or earnings significantly exceeds industry norms....

At this late stage of the credit cycle, with signs reminiscent of past episodes of excess, it's vital to ask: How vulnerable is the leveraged-loan market to a sudden shift in investor risk appetite? If this market froze, what would be the economic impact? In a worst-case scenario, could a breakdown threaten financial stability?

It is not only the sheer volume of debt that is causing concern. Underwriting standards and credit quality have deteriorated. In the

United States, the most highly indebted speculative grade firms now account for a larger share of new issuance than before the crisis. New deals also include fewer investor protections, known as covenants, and lower loss-absorption capacity. This year, so-called covenant-lite loans account for up 80 percent of new loans arranged for nonbank lenders (so-called "institutional investors"), up from about 30 percent in 2007. Not only the number, but also the quality of covenants has deteriorated.

Less investor protection

The volume of loans with fewer investor protections, known as covenants, has grown in the United States, and quality has weakened.

(percent of issuance)

Source: Standard & Poor's Leveraged Commentary and Data; IMF staff calculations; and Moody's.

Note: 2018 data is through Q3. Moody's Loan Covenant Quality Index score is a yearly average; data are unavailable from 2008 to 2010 due to lack of rated leveraged loan issuance.

(Tobias Adrian, Fabio Natalucci, and Thomas Piontek, ^{oe}[Sounding the Alarm on Leveraged Lending](#), IMFBlog, November 15, 2018)

Those who 'know' that banks will finally use their inflated interest-bearing 'bank reserves at the Fed' to stimulate real economic development will enthusiastically approve the increased lending associated with such manipulation. But, to paraphrase Michael Hudson:

...What predatory creditors really want is not merely the interest as such, but the collateral - whatever economic assets debtors possess, to 'own and control' their labor; their property; and, finally, their lives.

Welcome to ^{oe}[a neo-feudal world](#)! A two-tiered system of justice and governance with two sets of laws: one set for mega-wealth and the institutions and processes which sustain it, and another set for everyone else.

William Cohan, in an essay entitled 'What Hedge Funds Consider a Win Is a Disaster for Everyone Else: "Are you working in our interests? Or are you trying to screw me?"', has described Hedge Fund behavior well:

Once upon a time in America, when banks or investors lent money to a company, they expected to receive years of agreed-upon interest payments plus the return of the money borrowed. If the business did well, the lenders were paid back on time and made money. So they wanted the company to succeed. Not anymore.

Instead, the misuse of financial instruments is creating perverse incentives, rewarding crafty creditors for forcing companies into bankruptcy. Thanks to a lack of rules requiring creditors to be transparent, companies, their employees and their investors may have no way of knowing a creditor's real intentions until it's too late.

The main, but not the only, culprit is a form of financial insurance called credit-default swaps - and the hedge fund wiseguys who wield them like cudgels. Credit-default swaps, you may remember from the 2008 financial crisis, allow creditors to insure themselves against the risk that the borrower responsible for debt they own might go into default. Buying insurance means that in case of default they can still get paid back 100 cents on the dollar....

...So instead of trying to find ways to keep a company out of bankruptcy - say, by restructuring repayments or lowering the interest rate owed or adjusting other terms of a loan covenant to avoid default - hedge fund managers have been pushing the companies that owe them money into bankruptcy. The hedge funds figure they can make more money from the insurance payoff than they can from getting their principal repaid.

(William D. Cohan, ["What Hedge Funds Consider a Win Is a Disaster for Everyone Else: "Are you working in our interests? Or are you trying to screw me?"](#)", *New York Times*, May 12, 2019)

Dan Eberhart has described the Shale Oil 'industry' through the 2nd decade of the 21st century,

The shale industry has historically sought more than 40% of the capital it needs from debt and equity markets, and its appetite for outside financing to fuel the U.S. oil and gas boom of the last decade has been downright voracious. According to a Wall Street Journal analysis of FactSet data, the companies behind the boom have spent \$265 billion more than they generated from operations since 2010.

Energy experts continue to raise expectations for the shale sector's potential - the United States is projected to emerge as the undisputed global oil and gas leader over the next decade - but a key consideration is whether the sector will continue to have access to the capital it needs to achieve these lofty forecasts.

There should be no reason for concern. Producers survived the worst downturn in history and recently pushed U.S. oil production to record levels - with an output of 10 million barrels a day likely to be surpassed soon. Domestic oil prices have firmed up above \$60 per barrel, recently hitting their highest level since 2014. Exports of both oil and gas are ramping up, with global demand for U.S. LNG finally expected to lift domestic gas prices, which have been throttled by oversupply for years.

Industry cash flows are rising, balance sheets are getting stronger, and producers are hedging more production to lock in attractive prices on future production - providing a critical sense of financial security for lenders.

(Dan Eberhart, ["The Challenges Of Funding The U.S.'s Shale Boom 2.0"](#), *Forbes*, 26 January, 2018)

As Justin Mikulka has explained:

The U.S. shale oil industry hailed as a "revolution" has burned through a quarter trillion dollars more than it has brought in over the last decade. It has been a money-losing endeavor of epic proportions.

(Justin Mikulka, ["How Wall Street Enabled the Fracking 'Revolution' That's Losing Billions"](#), *DeSmog*, 4 May, 2018)

Three years later, Mikulka summed up the long-obvious reality for the shale oil business:

What's happening with the U.S. shale industry in this high price oil environment is unusual. Oil is typically a very predictable boom-and-bust business: When prices go up, oil drillers produce as much as they can, and when prices go down they stop.

But for American drillers right now, the money isn't there because investors no longer are willing to lend to frackers based on promises of future profits that have yet to materialize for the industry. In July 2020, accounting firm DeLoitte released a report stating that, "The U.S. shale industry registered net negative free cash flows of \$300 billion, impaired more than \$450 billion of invested capital, and saw more than 190 bankruptcies since 2010" - supporting the claim that the industry has peaked without ever making money....

The U.S. shale industry has been accurately described as being composed of "[capital destruction machines](#)". The [hundreds of billions in losses](#) the industry has accumulated in the past decade prove that it's true. With few investors willing to provide new capital to feed the machine, the only option is not drilling, even though prices are the highest they have been in years, at nearly \$75 per barrel. (Justin Mikulka, ["The U.S. Shale Revolution Has Surrendered to Reality: Fracking companies aren't drilling as investment continues to dry up"](#), *DeSmog*, Jul 16, 2021)

A commenter pseudonymed 'The Rev Kev' summed it all up:

The US shale industry has been like the Freddy Krueger of the American landscape. No matter how many times it looked like it had been killed off, it was back again. Hopefully this will finally die now that all the stupid money has dried up but this is not the end. This is merely the beginning. There is going to have to be an almighty reckoning with how much damage and destruction has been done to the American landscape and here I am talking about water & soil contamination, health care costs, habitat destruction, repair of public infrastructure and services (if it can be afforded), and economic depression in former fracking areas. I am here to say that eventually ... this will run into the trillions and that some damage cannot be undone. How do you replace contaminated aquifers for example?

Wall Street made out like bandits with the fracking industry but don't think that they will be anywhere to be seen when the cleanup bills

arrive. Their buddies in DC will make sure of that....

(The Rev Kev, ^œ*Naked Capitalism*, July 17, 2021)

Bubbles will appear *not as bubbles* but as evidence of the long-awaited recovery (the *Greenspan delusion* which persisted for nineteen years). However, as ^œEugene Linden put it: "...speculators love a bubble economy because bubbles always pop".⁷¹⁷

Greenspan's (and others') calm acceptance of bubbles as part of 'normal' economic activity has been examined by Oscar Jordà, Moritz Schularick and Alan Taylor (June 2015). As they have explained, prior to the 2008 crisis, "policymakers and economists preferred to ignore bubbles, arguing that they couldn't exist, or couldn't be detected, or not reliably, or that nothing could or should be done, or there might be unintended consequences, and so on":

What risk do asset price bubbles present to the economy? Naturally, in the wake of the largest financial crisis since the Great Depression, the causes and consequences of extended mispricing of financial assets have climbed to the top of the agenda for macroeconomists and policymakers. It has become harder to dismiss such bubble episodes as rare aberrations and exclude them from macroeconomic thinking on axiomatic grounds.

In the pre-crisis consensus, to a large extent, policymakers and economists preferred to ignore bubbles, arguing that they couldn't exist, or couldn't be detected, or not reliably, or that nothing could or should be done, or there might be unintended consequences, and so on. Researchers and central bankers imagined that the problem of depressions had been solved and that the financial sector would be self-stabilizing. The financial stability role of central banks was mostly regarded as secondary, if not quaintly vestigial. The crisis exploded these and other myths which had taken hold based on very little firm empirical evidence, and with scant regard for the lessons of history. The Former Fed Chairman very publicly resiled from old beliefs: he stepped away from a benign neglect approach to markets' irrational exuberance, admitted the "flaw" in his worldview, and began to entertain, as above, the possibility that central banks might need to pay heed to bubbles, or at least some of them, rather more seriously than before.

(Oscar Jordà, Moritz Schularick and Alan Taylor, ^œ*Leveraged Bubbles*, NBER Conference Paper (EASE15), June 2015)

The drive to deregulation which produces such consequences is based in a presumption that 'free markets' are 'naturally' self-correcting. As Bill Black put it, demonstrating Greenspan's predilection for *Ayn Rand style reasoning*:

At the heart of Greenspan's failure lies an ethical void in the brand of economics that has dominated American universities and policy circles for the last several decades, a brand known as "free market fundamentalism" or the "neoclassical school." (I call it "theoclassical economics" for its quasi-religious belief system.) Mainstream economists who follow this school assert a deeply flawed and controversial concept known as the "efficient market hypothesis," which holds that financial markets magically regulate themselves (they automatically "self-correct") and are thus immune to fraud. When an economist starts believing in that kind of fallacy, he is bound to become blind to reality. Let's take a look at what blinded Greenspan:

1. Greenspan knew that markets were "efficient" because the efficient market hypothesis is the foundational pillar underlying modern finance theory.
2. Markets can't be efficient if there is control fraud, so there must not be any.
3. Wait, there are control frauds! Tens of thousands of them.
4. Then control fraud must not really be harmful, or markets would not be efficient.
5. Control fraud, therefore, must not be immoral. As crime boss Emilio Barzini put it in *The Godfather*, "It's just business."

As delusional and immoral as this "logic" chain is, many elite economists believe it.

(William K. Black, May 29, 2013, ["How Elite Economic Hucksters Drive America's Biggest Fraud Epidemics"](#), *Alternet*)

Greenspan (Chairman of the US Federal Reserve 1987-2006), however, [true believer that he obviously is](#), has reaffirmed his faith in 'an international version of Adam Smith's "invisible hand"'. A deregulated, internationalized free market will, inevitably, and in a timely manner, 'self-correct'. Markets, left to themselves, really are 'efficient'.

In 1997 he spelled out his abiding faith in 'the market-stabilizing private regulatory forces' which 'should gradually displace many cumbersome, increasingly ineffective government structures' in future decades:

As the history of American banking demonstrates, private market regulation can be quite effective, provided that government does not get in its way.

Indeed, rapidly changing technology is rendering obsolescent much of the old bank examination regime. Bank regulators are perforce being pressed to depend increasingly on ever more complex and sophisticated private market regulation.

([Remarks by Chairman Alan Greenspan](#) At the Annual Conference of the Association of Private Enterprise Education, Arlington, Virginia April 12, 1997)

In 2011, he again assured anyone still listening that unsecured speculative investment bubbles and illusory wealth creation are merely 'notably rare exceptions' to the remarkable stability of deregulated free markets!

The problem is that regulators, and for that matter everyone else, can never get more than a glimpse at the internal workings of the simplest of modern financial systems. Today's competitive markets, whether we seek to recognise it or not, are driven by an international version of Adam Smith's "invisible hand" that is unredeemably opaque. With notably rare exceptions (2008, for example), the global "invisible hand" has created relatively stable exchange rates, interest rates, prices, and wage rates.

In the most regulated financial markets, the overwhelming set of interactions is never visible. This is the reason that interpretation of contemporaneous financial market behaviour is subject to so wide a variety of "explanations", especially in contrast to the physical sciences where cause and effect is much more soundly grounded.

(Alan Greenspan, ["Dodd-Frank fails to meet test of our times"](#), *Financial Times*, March 29, 2011)

One can but wonder what planet he lived on during the roller coaster years of his Federal Reserve chairmanship.

Charles Ferguson (2010) neatly summarized the bubble inducing consequences of the deregulation of US financial institutions from the 1980s (spanning the duration of Greenspan's Federal Reserve chairmanship):

Starting in the 1980s, and heavily influenced by laissez-faire economics, the United States began deregulating financial services. Shortly thereafter, America began to experience financial crises for the first time since the Great Depression. The first one arose from the savings-and-loan and junk-bond scandals of the 1980s; then came the dot-com bubble of the late 1990s, the Asian financial crisis; the collapse of Long Term Capital Management, in 1998; Enron; and then the housing bubble, which led to the global financial crisis. Yet through the entire period, the U.S. financial sector grew larger, more powerful, and enormously more profitable. By 2006, financial services accounted for 40 percent of total American corporate profits.

(^œ[Larry Summers and the Subversion of Economics](#), *The Chronicle of Higher Education*, October 3, 2010)

It is time to move beyond the free-market tautologies of the past forty years to which Greenspan so obviously subscribed.

Wolves and Sheep 🐺

 (24/07/16) (27/04/18)

Unless governments have in place effective regulatory powers and are able to require (and enforce) sufficient formal reserves to cover private lending and spending, they effectively [lose control of credit creation](#) and distribution, leading to unsecured speculative investment bubbles and illusory wealth creation⁷¹⁸.

Paul Krugman, commenting, approvingly, on a paper delivered by Larry Summers at the 14th Annual IMF Research Conference (November 8, 2013), suggests that, perhaps, economies like that of the United States need bubbles to achieve anything close to full-employment:

So how can you reconcile repeated bubbles with an economy showing no sign of inflationary pressures? Summers's answer is that we may be an economy that needs bubbles just to achieve something near full employment - that in the absence of bubbles the economy has a negative natural rate of interest. And this hasn't just been true since the 2008 financial crisis; it has arguably been true, although perhaps with increasing severity, since the 1980s.

(Krugman, November 16, 2013, ^œ[Secular Stagnation, Coalmines, Bubbles, and Larry Summers](#))

And, again, in a *New York Times* article entitled '^œ[A Permanent Slump?](#)' (November 17, 2013):

...Mr. Summers went on to draw a remarkable moral: We have, he suggested, an economy whose normal condition is one of inadequate demand - of at least mild depression - and which only gets anywhere close to full employment when it is being buoyed by bubbles.

I'd weigh in with some further evidence. Look at household debt relative to income. That ratio was roughly stable from 1960 to 1985, but rose rapidly and inexorably from 1985 to 2007, when crisis struck.

Yet even with households going ever deeper into debt, the economy's performance over the period as a whole was mediocre at best, and demand showed no sign of running ahead of supply. Looking forward, we obviously can't go back to the days of ever-rising debt. Yet that means weaker consumer demand - and without that demand, how are we supposed to return to full employment?

Again, the evidence suggests that we have become an economy whose normal state is one of mild depression, whose brief episodes of prosperity occur only thanks to bubbles and unsustainable borrowing.

...as Mr. Summers said, the crisis "is not over until it is over" - and economic reality is what it is. And what that reality appears to be right now is one in which depression rules will apply for a very long time.

 (23/03/16) (09/06/17)

That 'economic reality' to which Krugman alludes is inevitable within a globalized neoliberal economic world.

If wealth is drained from the bottom 60+% of the population, to [accumulate within the top 5%](#), and [stimulus funds become trapped within Federal Reserve bank reserves](#), the absence of generalized inflation, "with households going ever deeper into debt" and "the economy's performance... mediocre at best", is scarcely surprising⁷¹⁹. Deregulated financial institutions, gifted vastly inflated and interest-bearing bank reserves, together with access to the accumulating wealth of the top 5%, are free to indulge in bubble blowing, resulting in, as ^œ[Robert Shiller \(2013\)](#) put it,

..."a situation in which news of price increases spurs investor enthusiasm, which spreads by psychological contagion from person to person, in the process amplifying stories that might justify the price increase." This attracts "a larger and larger class of investors, who, despite doubts about the real value of the investment, are drawn to it partly through envy of others' successes and partly through a gambler's excitement."

Many who become enmeshed in such schemes are duped by often impressively connected and apparently 'professional', but under- or unregulated, financial advisers intent on ensnaring the unwary. Others are driven to it through despair of ever finding any other means of climbing out of the financial mire into which members of the increasingly disenfranchised lower 95% too often find themselves⁷²⁰.

As Jefferson put it "they have divided their nations into two classes, wolves and sheep".

 (29/05/20)

Sridhar Natarajan has described the 2018 consequences as a global proliferation of extreme wealth has provided private banks with a lucrative target population, bypassing and sidelining those who have already lost almost everything:

A global proliferation of extreme wealth over the past decade is providing banks with opportunities to land new clients. That's helped Goldman Sachs's private-banking arm -- long dwarfed by units at firms including Morgan Stanley, Bank of America Corp. and JPMorgan Chase & Co. -- win lucrative business in recent years.

"The world seems to be growing rich people faster than we can grow advisers to cover them," Chief Executive Officer ^œ[Lloyd Blankfein](#) told

[investors](#) in February. The firm has about 700 private-wealth advisers, each generating an average of \$4.5 million of revenue, he said.

The private wealth management unit works with individuals, families, foundations and endowments who typically entrust more than \$40 million with the firm. It falls under the investment-management division, which also includes Goldman Sachs Asset Management....

Goldman Sachs had \$458 billion of assets from high-net-worth individuals at the end of 2017. Rivals Morgan Stanley and Bank of America, which target a wider swath of clients, both have more than \$2 trillion.

(Sridhar Natarajan, [Goldman Taps John Mallory to Head Unit Targeting America's Super-Rich](#), *Bloomberg*, April 24, 2018)

When conditions like these emerge, governments lose control of credit creation and distribution, leading to unsecured speculative investment bubbles, illusory wealth creation and, as the bubbles burst, further concentration of wealth in the hands of those who funded the bubbles.

Stable economic conditions and relatively full employment emerge when governments take their responsibilities seriously, ensure effective, socially responsible economic regulation, and engage in credit redistribution to ensure real economic health and the well-being of their populations.

Bill Mitchell has provided a digital version of a 1945 Australian Government White Paper entitled '[FULL EMPLOYMENT IN AUSTRALIA \(The 1945 White Paper\)](#)'. It provides a vision, commonplace in the post-New-Deal period from the late 1930s to around 1970, of a nation which ensured remunerative employment to all who needed or wanted a job. As the first statement in the Introduction says:

Full employment is a fundamental aim of the Commonwealth Government. The Government believes that the people of Australia will demand and are entitled to expect full employment, and that for this purpose it will be able to count on the cooperation of servicemen's associations, trade unions, employers' associations and other groups. ...[T]he cooperation of State Governments and local authorities will be particularly necessary.

(For a clear discussion of the issues as they relate to the early 21st century see Bill Mitchell, [May 30, 2020 - we remember the release of the 1945 White Paper on Full Employment](#), Wednesday, May 27, 2020)

It is, of course, inevitable that neoliberal economists and fellow travelers will develop 'explanations' which flow from their ideological presumptions to justify 'free trade', globalization and the presumed reality of Adam Smith's "invisible hand": where deregulated, internationalized free markets inevitably, and in a timely manner, 'self-correct'. The result, however, is a world in which fewer and fewer persons and corporations concentrate the wealth of the society - a world where 'economic health' requires 'bubbles'; where, as Paul Krugman puts it, the 'normal state' of the economy is:

...one of mild depression, whose brief episodes of prosperity occur only thanks to bubbles and unsustainable borrowing.

'Unsustainable borrowing' is the *raison d'être* of bubble economies. [Those who fund bubbles seldom do so benignly](#). Bubbles are only truly profitable when the value of the foreclosed, discounted collateral of those induced to engage in 'unsustainable borrowing' is transferred to the lenders⁷²¹.

Rebecca Burns, Michael Donley and Carmilla Manzanet (2014) have examined the consequences of the burst housing bubble in the US since 2008:

...Seeing a profitable opening in the wake of the foreclosure crisis, investment groups have worked diligently to bring a "rentership society" into being. During the past two years, investors have bought approximately 200,000 single-family homes, mostly foreclosures, in urban areas nationwide, with plans to convert them into rental properties. In Atlanta, one such investment group purchased 1,400 homes on a single day in April of last year.

This investor-led feeding frenzy has sent home sales and prices rising again, leading some commentators to hail a "robust housing recovery." But it's one that's happening largely without homeowners.

...Long a bête noire for progressive activists because of its history of buying out troubled companies and then shipping jobs overseas, Blackstone began its foray into real estate in 2012, when it created a subsidiary called Invitation Homes to purchase and manage single-family rental homes. Invitation Homes has since become the largest owner of single-family homes in the United States, spending more than \$7 billion to gobble up 41,000 properties.

...Blackstone is backed by a host of companies that bear direct responsibility for the foreclosure crisis, including Morgan Stanley, CitiBank and Bank of America. After first making money from the housing bubble that crashed the economy, then benefitting from the federal bailout, banks and investors now stand ready to profit all over again by cleaning up the mess they made.

(Rebecca Burns, Michael Donley & Carmilla Manzanet, [∞][Game of Homes: The private-equity firm Blackstone could be your next landlord](#), *In These Times* and The Institute For Public Affairs, March 31, 2014)

Since its 2007 emergence, Blackstone's property empire has grown exponentially, parasitically feeding on the misfortunes of property owners wherever and whenever this occurs and turning the acquired properties into exploitative rentals. Nick Corbishley has elaborated:

Back in 2008, Blackstone emerged as one of the biggest beneficiaries of the subprime crisis, becoming a trailblazer in financializing rents. As that crisis went global, so too did Blackstone's property empire. By the time the dust had settled, it was the biggest commercial real estate company on the planet, according to Fortune magazine. .

Now, Blackstone wants to repeat the feat, albeit using a somewhat different playbook. At the Goldman Sachs Financial Services Conference, held on December 9, Blackstone's CEO, Stephen Schwarzman, gave a few hints about how it plans to do just that. Asked if he thought large firms such as Blackstone would once more gain more market share during this crisis, he responded:

I think something similar will happen. You always have winners and losers. Blackstone was a huge winner coming out of the global financial crisis. And I think something similar is going to happen.

During the last crisis, Blackstone pioneered the buy-to-rent scheme by snapping up, for cents on the dollar, huge batches of foreclosed homes from struggling and bailed-out banks and then turning them into rental properties. In short order, Blackstone's subsidiary Invitation Homes

became the largest owner of single-family rental homes in the United States. It also took the meaning of "absentee landlord" to a whole new level, as accusations of ill repair and poor maintenance quickly mounted. Tenants also complained about excessive rent increases and fees.

Waiting for "Blood in the Streets"

Once the model was up and running in the U.S., it was quickly exported to cities in Canada (Toronto) and Europe (Berlin, Madrid, Barcelona, Dublin, Stockholm...). Since going public in 2007, Blackstone has multiplied eightfold the equity capital it devotes to real estate, to \$163 billion. As Scharzman himself put it, the company's strategy in post-crisis Europe essentially involved "waiting to see how beaten up people's psyches get, and where they're willing to sell assets ... You want to wait until there's really blood in the streets." (Nick Corbishley, ^œ[Wall Street Mega-Landlord Blackstone Prepares to Reap the Spoils of Another Crisis](#), *NakedCapitalism*, December 29, 2020)

The performance of the poorly regulated 'Hedge Funds' industry over the past several decades provides a salutary example of similar activity. Greg Fisher (2012), reviewing Simon Lack's *The Hedge Fund Mirage* (John Wiley & Sons, 2012), summarized Lack's examination of Hedge Fund performance:

Lack estimates that from 1998-2010 investors collectively lost \$308 billion in hedge funds while the industry earned fees of \$324 billion.

As he concluded:

...One wonders why the assets continue to flow in. Here's how the book begins: "If all the money that's ever been invested in hedge funds had been put in treasury bills instead, the results would have been twice as good."

...Lack is an industry insider, having spent a career at JPMorgan, where he helped to allocate more than \$1 billion to hedge funds and to seed emerging hedge fund managers. Immersed in the industry, he eventually came to the conclusion that: "While the hedge fund industry has generated fabulous wealth and created many fortunes, it has largely done so for itself." ... "Star-struck investors have too often equated enormous financial success amongst managers with high returns for clients... Faulty or weak analysis, performance chasing, shortage of skepticism, and a desire to be associated with winners without proper regard for terms have all caused the sorry result." (Gregg S. Fisher, ^œ[Chasing the Mirage of Hedge Fund Returns](#), *Forbes*, Personal Finance, 1/23/2012)

Les Leopold has summed up the rewards obtained by those who engage in such 'financial strip mining':

...[T]he true robber barons run hedge funds and private equity companies. They make billions, not millions, and they do it not by running businesses, but by siphoning wealth away from companies, consumers, students and governments.

...Hedge funds and their close cousins - private equity firms and the proprietary trading desks at large banks - are financial strip miners. Rather than create new products and services, they tear wealth away from the real economy...

(Les Leopold, [∞][Studies of Bloated CEO Pay Miss the Fattest Cats in America](#), *Moyers & Company*, April 21, 2014)

Such predator-friendly, roller-coaster conditions arise as capitalist societies devolve from democratic to plutocratic organization. In well regulated democratically organized capitalist societies, bubbles are anomalies!

For more on this see: [The post-1970s erosion of bank regulation which ultimately led to the 2007-9 crisis](#)

The Nature of Taxation in Democratically Organized Capitalist Nations

 (25/02/16) (10/12/16) (19/09/17) (07/11/19) (06/04/17) (03/06/16) (10/06/16) (16/09/17) (29/03/18)(08/04/18) (16/04/18) (06/11/19) (07/02/21) (12/02/21) (14/02/21) (24/04/21) (04/01/22)

Before we continue, let's make something absolutely clear.

Sovereign governments do not need to tax in order to spend. They can *create the credit* they need.

However, they do *need to tax in order to ensure equity*⁷²². This is not some recent 'progressive' presumption. Francis Bacon, in 1625, and later James Madison, in 1792, *explained the purpose* of such taxation. Governments have a *fiduciary, commonweal* responsibility to their constituents. If they allow the unchecked accumulation of credit in the hands of a few, then, as Lincoln explained in 1864,

the money power of the country will endeavor to prolong its reign by working upon the prejudices of the people until all wealth is aggregated in a few hands and the Republic is destroyed.

If this seems like an unnecessary restatement of the obvious so-be-it! As we've seen, in this neoliberal age, even those who recognize governments' responsibility for the commonweal seem to believe that governments must tax in order to spend. Joseph Stiglitz, Todd Tucker, and Gabriel Zucman provide a cautionary example of this. These are surely 'progressive' economists of the early 21st century and yet they assert:

The state requires something simple to perform its multiple roles: revenue. It takes money to build roads and ports, to provide education for the young and health care for the sick, to finance the basic research that is the wellspring of all progress, and to staff the bureaucracies that keep societies and economies in motion. No successful market can survive without the underpinnings of a strong, functioning state.

That simple truth is being forgotten today. In the United States, total tax revenues paid to all levels of government shrank by close to four percent of national income over the last two decades, from about 32 percent in 1999 to approximately 28 percent today, a decline unique in modern history among wealthy nations. The direct consequences of this shift are clear: crumbling infrastructure, a slowing pace of innovation, a diminishing rate of growth, booming inequality, shorter life expectancy, and a sense of despair among large parts of the population. These consequences add up to something much larger: a threat to the sustainability of democracy and the global market economy.

(Joseph E. Stiglitz, Todd N. Tucker, and Gabriel Zucman, [∞][The Starving State: Why Capitalism's Salvation Depends on Taxation](#), *Foreign Affairs*, January/February 2020)

So, once again, let's repeat: 'Sovereign Governments are [not hamstrung by 'lack of taxes'](#)!

Too much [government 'debt'](#) (i.e. Central Reserve Authority or 'Central Bank' created sovereign credit) fed into the real economy can, amongst other things, result in various forms of price inflation and in a crisis in confidence as to the 'real worth' of money. So, in the long run, government cannot simply continue to issue credit indefinitely. It must, over time, balance credit availability with desired levels of economic activity and public confidence in the 'value' of credit. Amongst the controls through which it achieves these ends is taxation.

Since government must maintain a balance between availability of credit for economic activity of various kinds, and confidence in the value of money, it must keep control of the money supply and should only tax or 'rein in expenditure' to *pay down its deficit* (i.e. 'balance budgets' and create 'budget surpluses') if it wants to regulate the growth of economic activity⁷²³. Such measures withdraw credit from the economy and result in consequent economic contraction.

In democratically organized capitalist societies, taxation is not simply about withdrawing credit from the private sector (and it is *not about 'raising revenue'*). It is, far more importantly, about [ensuring an equitable redistribution of wealth](#) through the society: quite literally taking from the rich and redistributing the wealth through the society to ensure continued credit circulation and consequent 'economic health'⁷²⁴.

Franklin Roosevelt, in a 1936 speech, put it clearly:

...One sure way to determine the social conscience of a Government is to examine the way taxes are collected and how they are spent. And one sure way to determine the social conscience of an individual is to get his tax-reaction.

Taxes, after all, are the dues that we pay for the privileges of membership in an organized society.

As society becomes more civilized, Government - national, State and local government - is called on to assume more obligations to its citizens. The privileges of membership in a civilized society have vastly increased in modern times. But I am afraid we have many who still do not recognize their advantages and want to avoid paying their dues...

Taxes are the price we all pay collectively to get those things done.

To divide fairly among the people the obligation to pay for these benefits has been a major part of our struggle to maintain democracy in America.

Ever since 1776 that struggle has been between two forces. On the one hand, there has been the vast majority of our citizens who believed that the benefits of democracy should be extended and who were willing to pay their fair share to extend them. On the other hand, there has been a small, but powerful group which has fought the extension of those benefits, because it did not want to pay a fair share of their cost.

That was the line-up in 1776. That is the line-up in this campaign. And I am confident that once more - in 1936 - democracy in taxation will win.

Here is my principle: Taxes shall be levied according to ability to pay. That is the only American principle.
(Franklin D. Roosevelt: ^œ [Address at Worcester, Mass.](#), October 21, 1936. Online by Gerhard Peters and John T. Woolley, The American Presidency Project)

The importance of both clearly legislated *public* welfare programs coupled with various processes of wealth redistribution in democratically organized capitalist societies cannot be too strongly stressed⁷²⁵. As has been suggested elsewhere, [private philanthropy is not a reasonable substitute for publicly legislated and guaranteed social welfare](#) programs and processes. Nor is it reasonable to leave equitable wealth redistribution to plutocratic largesse. As [Fred Guerin explained](#),

A society that genuinely cares for its citizens' well-being has little need for manufactured, top-down charity because such a society builds institutions that democratically enable all citizens to [participate in a shared commons](#), where no one need suffer the indignity of gross injustice, burdensome debt or soul-destroying poverty.

Bill Mitchell has clearly addressed these issues:

Neo-liberal economists have long endorsed a BIG [basic income guarantee] as a way of avoiding starvation in a world where they want charitable services to be privately supplied.

These economists hate collective solutions to social problems. Just read Milton Friedman's 1994 Introduction to F.A. Hayek's 50 Anniversary edition of *The Road to Serfdom* where he expressed disdain for the "growing intellectual support of collectivism" and suggests that the main game is to defeat any semblance of collective action (which he considers tantamount to socialism).

(Bill Mitchell, ^œ[A basic income guarantee is a neo-liberal strategy for serfdom without the work](#), *Billy Blog*, April 5, 2017)

Josh Bivens has cogently argued that there is a need for both a jobs guarantee and a universal basic income for those who need access to such income. Further, as he explains, both job guarantee programs and universal basic income programs should focus on the '*quality of life*' not only afforded to those who rely on such programs but as a means of ensuring a minimum quality of life experience within the society. Here is a summary of his 'recommendations for creating jobs and economic security in the U.S.':

- **We need to maintain aggregate demand at levels consistent with macroeconomic full employment.** The most important task facing policymakers is ensuring that aggregate demand (spending by households, businesses, and governments) at the *national* level is high enough to support maximum sustainable levels of employment (or *macroeconomic full employment*). This aggregate demand management is the task of macroeconomic policy - specifically, fiscal, monetary, and exchange rate policies. If aggregate demand is too low, no other job creation strategy can work at scale until the shortfall is fixed.
- **We need to make sure the resulting job growth is widely shared.** Complementary policies should be enacted to ensure that the maximum sustainable level of aggregate demand nationally is spread as widely as possible across workers, regions, and communities.

- To make a given level of aggregate demand as "job-intensive" as possible, policies aimed at reducing average hours of work should be pursued. Efforts to reduce working time include paid family and medical leave, paid vacations, allowing work-sharing subsidies in the unemployment insurance system, and preserving recent increases in the salary threshold below which hourly workers automatically qualify for overtime pay.
- To ensure that the maximum national level of aggregate demand is spread widely across regions and communities, we can use the strategic deployment of public investments like infrastructure, energy efficiency, and early child care and education. These investments are crucially important to undertake even if they result in no net new jobs at all. But their deployment can be prioritized in part based on their potential for creating jobs in communities that need them. In the jargon of macroeconomists, this means leaning more heavily on targeted fiscal policy and less on untargeted monetary policy to maintain nationally appropriate levels of aggregate demand.
- **We need to then address remaining stubborn pockets of unemployment through targeted policies and programs, including a "public option for employment."** Once genuine full employment is achieved nationally, and once this national full employment is spread widely across the country through reduced work hours and increased public investments, there will still be pockets of unemployment remaining. To address these remaining unemployment hot spots, policymakers should begin building capacity to undertake the direct hiring of people for public service jobs that can serve as a "public option for employment." The public-sector managerial capacity to do this at scale in the very near term is likely limited. A key priority should be building this managerial capacity up quickly.
- **We need to focus on boosting job *quality* as well as quantity.** Policymakers should focus on boosting job *quality* of both new and incumbent jobs as well as simply creating more jobs. The most widespread labor market problem facing U.S. workers is near-stagnant wage growth faced by the bottom 70 percent of workers over recent decades. Solving this job quality problem will require boosting the economic leverage and bargaining power of low- and moderate-wage workers through a range of policy interventions, from targeting macroeconomic full employment to modernized labor standards to rewriting the rules governing globalization.
- **We need to ensure that people's basic economic security is not so tightly linked to their employment.** Finally, policymakers should aim to delink some key measures of economic security from employment. For example, health and retirement benefits can be expanded through existing social insurance models (say by expanding Social Security and Medicare) rather than remaining tightly linked to particular jobs.
(Josh Bivens, ^{oe}[Recommendations for creating jobs and economic security in the U.S.:](#) Making sense of debates about full employment, public investment, and public job creation, *Economic Policy Institute*, March 27, 2018)

These do, indeed, seem to be necessary elements of a genuine, quality-of-life-ensuring, social safety net in a truly democratic society. They need to be accompanied by effective means of taxation to ensure an equitable, ongoing redistribution of wealth through the society.⁷²⁶

We need, constantly, to remind ourselves that 'the economy' is not a separate, self-contained, autonomous environment, governed and defined by its own peculiar sets of 'natural laws'. Economic activity is *embedded* within the fabric of societies (it is *an aspect of social life*, the means by which human beings ensure their material wellbeing).

In consequence, any 'programs' designed to enhance the [infrastructures of capitalism](#) and/ or the wellbeing of individuals and communities should be seen not as *economic* programs but as elements of [The Commons](#) in capitalist societies, constrained and informed by all the tensions, ideological biases and flaws of social organization and interaction in such societies.

Pavlina Tcherneva has discussed all this in a Working Paper entitled *The Job Guarantee: Design, Jobs, and Implementation*. As she explains:

The job guarantee (JG) is a public option for jobs. It is a permanent, federally funded, and locally administered program that supplies voluntary employment opportunities on demand for all who are ready and willing to work at a living wage. While it is first and foremost a jobs program, it has the potential to be transformative by advancing the public purpose and improving working conditions, people's everyday lives, and the economy as a whole.

This working paper provides a blueprint for operationalizing the proposal. It addresses frequently asked questions and common concerns. It begins by outlining some of the core propositions in the existing literature that have motivated the JG proposal. These propositions suggest specific design and implementation features. (Some questions are answered in greater detail in appendix III). The paper presents the core objectives and expected benefits of the program, and suggests an institutional structure, funding mechanism, and project design and administration....

The JG is first and foremost a program that provides decent jobs at decent pay, but it resides within a broader policy agenda. A comprehensive policy reform that aims to address income insecurity must incorporate other forms of nonwage income support. These would include expanding Social Security and Disability benefits, reducing the retirement age and working week, and instituting a federal-level paid family leave. Furthermore, while the JG will go a long way to reducing individual and household poverty, an anti-poverty agenda ought to also include a universal child allowance policy, universal childcare, free school lunches, and a public healthcare option, to name a few. (Pavlina R. Tcherneva, ^{oe}[The Job Guarantee: Design, Jobs, and Implementation](#), *Levy Economics Institute of Bard College*, Working Paper No. 902, pp. 2, 8, April 2018)

This is, as she points out, a 2018 updating and expanded version of 'Franklin D. Roosevelt's call for [an Economic Bill of Rights](#)'. It includes far more than a simple Jobs Guarantee. It would require a revolutionary reorganization of capitalism focused, indeed, on 'government of the people *by the people*'.⁷²⁷ And, in order to ensure its success it would, of course, require a concurrent set of policies to ensure effective means of credit redistribution through time.

Unless democratic capitalist societies pursue effective redistributive policies, they inevitably, over time, devolve from democracy to plutocracy.

Using thermodynamic dissipative processes as an analogy, economic activity is the dissipation of credit over time. In order to avoid the inevitable [long-term entropic consequences of credit dissipation](#), the issuer of credit needs to be able to 'reset' credit distribution through time. This is usually accomplished through taxation (and other processes of revenue collection) and redistribution ⁷²⁸.

Beardsley Ruml, Chairman of the Federal Reserve Bank of New York in the latter stages of the Roosevelt Administration, addressed the post-New Deal understanding of the nature and purpose of taxation in an article entitled 'œTaxes For Revenue Are Obsolete ' (œAmerican Affairs, April 1946). As Ruml explained:

What Taxes Are Really For

Federal taxes can be made to serve four principal purposes of a social and economic character. These purposes are:

- 1.As an instrument of fiscal policy to help stabilize the purchasing power of the dollar;
- 2.To express public policy in the distribution of wealth and of income, as in the case of the progressive income and estate taxes;
- 3.To express public policy in subsidizing or in penalizing various industries and economic groups;
- 4.To isolate and assess directly the costs of certain national benefits, such as highways and social security.

In the recent past, we have used our federal tax program consciously for each of these purposes. In serving these purposes, the tax program is a means to an end. The purposes themselves are matters of basic national policy which should be established, in the first instance, independently of any national tax program.

Among the policy questions with which we have to deal are these:

Do we want a dollar with reasonably stable purchasing power over the years?

Do we want greater equality of wealth and of income than would result from economic forces working alone?

Do we want to subsidize certain industries and certain economic groups?

Do we want the beneficiaries of certain federal activities to be aware of what they cost?

These questions are not tax questions; they are questions as to the kind of country we want and the kind of life we want to lead. The tax program should be a means to an agreed end. The tax program should be devised as an instrument, and it should be judged by how well it serves its purpose.

Since, as Ruml explained, taxes are not 'needed' in order to fund revenue raising, "the public purpose which is served should never be obscured in a tax program under the mask of raising revenue". Taxes should never be

considered 'government income'. They serve two primary purposes: to maintain a stable monetary base and to redistribute credit through the society.

Taxing the Superrich It is past time to Re-empower communities 🐟

 (05/03/16) (30/04/16) (24/05/16) (10/11/17)(01/05/20) (09/05/20) (19/04/21) (19/05/23)
(21/05/23) (13/06/23)

In the third decade of the 21st century Western capitalist nations are living in a time of societal collapse.

The neoliberal unleashing of unregulated, greed-driven, *Laissez faire* capitalism has been based on [denying the very existence of 'societies' of interdependent people](#) and the communities in which they live.

We are living in a time in which independent self-interest has triumphed over social responsibility; when greed and the drive to consume and accumulate have over-ridden a sense of responsibility and concern for the wellbeing of each other.

A time in which communities and nations are seen as impediments to 'economic success', to be disempowered and dismantled to facilitate the 'free' exploitation of human beings and environments, accumulation of assets and movement of capital in the self-interested pursuit of 'wealth'.

We are living in a time when capitalism has evolved and, [true to its history](#), 'tradition' - the legitimization and empowering of communities - has been demonized and its subversion has become regarded as 'necessary' to 'development'⁷²⁹. A time when the true nature of 'capitalism' has been made plain and exposed.

Margaret Thatcher's absurd proclamation that

There is no such thing as society. There are individual men and women has 'justified' the defunding of communal infrastructures and services; dismantling of social safety nets and processes of wealth redistribution.

Political paralysis is snuffing out what is left of our anemic democracy.

It is the paralysis of doing nothing while the ruling oligarchs, who have increased their wealth by nearly a third since the pandemic began and by close to 90 percent over the past decade, orchestrate virtual tax boycotts as millions of Americans [and inhabitants of other Western nations] go into bankruptcy to pay medical bills, mortgages, credit card debt, student debt, car loans and soaring utility bills demanded by a system that has privatized nearly every aspect of our lives.

It is the paralysis of doing nothing about raising the minimum wage, despite the ravages of inflation, around 600,000 homeless Americans and 33.8 million people living in food insecure homes, including 9.3 million children.

It is the paralysis of ignoring the climate crisis, the greatest existential threat we face, to expand fossil fuel extraction.

It is the paralysis of pouring hundreds of billions of dollars into the permanent war economy rather than repairing the nation's collapsing roads, rails, bridges, schools, electrical grid and water supply...

(Mr Fish, ^œ[Follow the Money](#), *The Chris Hedges Report*, April 23, 2023)

Governments should never shy away from social, economic and environmental regulation and 'wealth taxes'⁷³⁰. They are necessary to counter the inevitable long-term unravelling of communities, destruction of environments and entropic consequences of credit dissipation, ensuring continued credit circulation and consequent 'economic health'.

Thomas Piketty and Emmanuel Saez (2013) provide a compelling case, with historical contextualization, for progressive inheritance, income and wealth taxes in democratically organized capitalist societies. As they summarize:

...We emphasize three main rationales for capital taxation.

First, the frontier between capital and labor income flows is often fuzzy, thereby lending support to a broad-based, comprehensive income tax.

Next, the very notions of income and consumption flows are difficult to define and measure for top wealth holders. Therefore the proper way to tax billionaires is a progressive wealth tax.

Finally, there are strong meritocratic reasons why we should tax inherited wealth more than earned income or self-made wealth (for which individuals can be held responsible, at least in part). This implies that the ideal fiscal system should also entail a progressive inheritance tax, in addition to progressive income and wealth taxes.

We then confront our prescriptions with historical experience. Although there are significant differences, in particular regarding the wealth tax, we argue that observed fiscal systems in modern democracies bear important similarities with this ideal triptych.

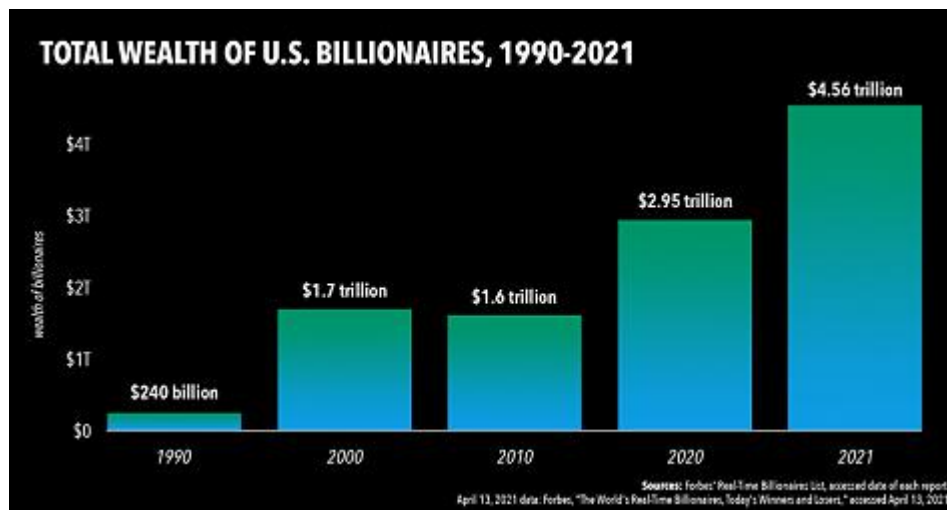

(Thomas Piketty and Emmanuel Saez, ^{ae}[Rethinking capital and wealth taxation](#), September 17, 2013)

There seems little or no reason why in this neoliberal deregulated world 'we should tax inherited wealth more than earned income or self-made wealth'. Why give the super-rich a loophole through which their hired help can funnel their deregulated 'gains'? As Chuck Collins has described,

America's 719 billionaires now hold over four times more wealth (\$4.56 trillion) than all the roughly 165 million Americans in society's bottom half (\$1.01 trillion), according to Federal Reserve Board data.

In 1990, the situation was reversed - billionaires were worth \$240 billion and the bottom 50 percent had \$380 billion in combined wealth.

Billionaires' huge pandemic-era wealth gains have come amid the past 13 months of coronavirus misery. During those same 13 months, over 30 million Americans fell ill from COVID, over 560,000 died from it and about 77 million lost jobs.

(Chuck Collins, ^{oe}[A Third of U.S. Billionaire Wealth Gains Since 1990 Have Come During Pandemic: U.S. billionaire pandemic profit balloons to \\$4.56 trillion, a 55 percent increase](#), *Inequality.Org*, April 15, 2021)

Tax and spend' is what governments do (or ought to do!). It is the primary means by which credit distribution is reset through time, countering the long-term entropic consequences of credit dissipation! This does not require 'big government'. It merely requires effective processes of redistribution ⁷³¹. How that is achieved will always be determined by the secondary ideologies of those in power.

The equitable distribution of credit through any society requires both taxation and redistribution. Josh Biven has explained the problem in the US over the past forty years and suggested ways in which to address it:

...To put it simply, the rise in inequality has easily been the biggest factor driving underperformance of income growth for the bottom and middle. We define this underperformance in two ways in this paper. The first is essentially definitional - income growth for the bottom 90 percent of households that significantly lags economy-wide average growth (that is, slower growth than what the economy could have delivered to all households). That is, any increase in inequality should be seen as a potential economic policy failure. The second definition of underperformance is simply income growth for the bottom 90 percent that is significantly slower than what these households experienced in earlier economic eras....

Since the rise of inequality has been the biggest cause of disappointing income growth for the vast majority, reversing (or at least stopping) this rise in inequality is obviously key to accelerating future living standards' growth for this group. In short, an economic strategy that does not aim to explicitly confront inequality would severely shortchange the living standards of the vast majority. Given this, it is bizarre indeed to argue that policymakers should not make it a priority to reverse (or at least stop) recent decades' trends toward greater inequality.

Those arguing for ignoring distribution and focusing only on growth often claim (at least implicitly) that progressive redistribution and growth conflict, and that strategies aimed explicitly at progressively redistributing income will hamstring overall growth. In fact, recent economic history in the U.S. strongly indicates that it is regressive redistribution and growth that are in conflict; the package of policy changes that led to the rise in inequality did nothing to boost overall

growth of the economy. Instead, as inequality rose, overall growth rates fell. In short, equity and efficiency are often not in conflict. And an ambitious agenda that restores economic power to the vast majority can make the economy grow both fairer and faster. (Josh Bivens, ^œ[Progressive Redistribution Without Guilt: Using Policy to Shift Economic Power and Make U. S. Incomes Grow Fairer and Faster](#), *Economic Policy Institute*, Report 107762, June 9, 2016)

Francis Bacon, in 1625, explained the state's responsibility to its citizenry:

Money is like muck, not good except it be spread.

Over the past half century, Western nations, committed to a *laissez faire*, free-market-fundamentalist world have ignored Bacon's warning. The result has been an unsustainable, exponential [exploitation of environments, resources and peoples](#) for private gain and a burgeoning and dramatic increase in income and wealth inequality.

Laissez faire capitalism has, indeed, denied the very existence of communities. [Margaret Thatcher's absurd proclamation](#) that

There is no such thing as society. There are individual men and women has 'justified' the defunding of communal infrastructures and services; dismantling of social safety nets and processes of wealth redistribution.

Emmanuel Saez and Gabriel Zucman, in an article entitled 'Taxing the Superrich', have explained how Western nations can begin to redress this burgeoning inequality:

Wealth is power. An extreme concentration of wealth means an extreme concentration of power: the power to influence government policy, the power to stifle competition, the power to shape ideology...

For the sake of justice and democracy, we need a progressive wealth tax.⁷³²

It has been said several times but cannot be too strongly stressed: *Unless democratic capitalist societies pursue effective redistributive policies, they inevitably, over time, devolve from democracy to plutocracy.*

Emmanuel Saez and Gabriel Zucman explained James Madison's concern for the United States:

Writing in 1792 about the necessity and dangers of political parties, James Madison made the connection between excessive wealth and its political influence:

The great object should be to combat the evil:

1. By establishing a political equality among all.
2. By withholding unnecessary opportunities from a few, to increase the inequality of property, by an immoderate, and especially an unmerited, accumulation of riches.
3. By the silent operation of laws, which, without violating the rights of property, reduce extreme wealth towards a state of mediocrity, and raise extreme indigence towards a state of comfort.

[James Madison, ^œ[In every political society, parties are unavoidable](#), 23 Jan. 1792, Papers 14:197--98]

And [Lincoln in 1864](#):

the money power of the country will endeavor to prolong its reign by working upon the prejudices of the people until all wealth is aggregated in a few hands and the Republic is destroyed.

(30/07/16) One of the important functions of government in democratically organized capitalist societies is [administration, development and maintenance of what, under feudalism, was termed 'the commons'](#). As capitalism has matured, more and more features of the physical, social and intellectual realms have become recognized as commodities and, therefore, available for divestment to private individuals to be 'profitably' developed. In the process, government responsibilities have been weakened and warped to individualized, self-interested ends.

Earlier in his Report Biven argues for well defined 'public' responsibilities of government and suggests some of the ways in which 'we can fix the problem':

How we can fix the problem: Income redistribution over the last few decades has been a zero-sum process, with gains at the top essentially coming straight out of the pockets of the bottom 90 percent of Americans. This zerosum dynamic means that intelligent policies - including but going way beyond smarter and fairer taxing and spending - can convert these lost potential gains for the bottom and middle into actual income increases without harming overall economic growth. We should:

- Use the levers of macroeconomic policy (monetary, fiscal, and exchange-rate policy) to target genuine full employment.
- Make investments that markets are not making - in early childhood education, infrastructure, school construction, energy efficiency, and public health care.
- Strengthen antitrust regulations and look for other opportunities to introduce competition to private markets, such as public options for health insurance and retirement savings.
- Reregulate many activities of the financial sector to squeeze out the activities that don't enhance productivity or create efficiency but simply enrich well-placed actors within finance. A financial transactions tax is the clearest example of a policy that can stop this income skimming.
- Enact climate-change mitigation measures - realizing that policies beyond simply increasing the market price of greenhouse gas emissions can play large and useful roles.
- Strengthen regulations and institutions that help shift bargaining leverage from capital-owners and corporate managers to low- and middle-income workers. Key examples include higher minimum wages and labor law reform that allows willing workers to join unions and bargain collectively.

In large part, the rhetoric which employs 'tax and spend' as a pejorative epithet, assumes that government should not be involved in the distribution and redistribution of credit: the 'free market' will sort it all out! Both history and an examination of models of trade dynamics provide fairly convincing evidence that it does not and cannot (see Thomas Piketty (Trans. Arthur Goldhammer) ^{oe}[Capital in the Twenty-First Century](#) (Harvard University

Press, April 2014) for an historical examination of the reasons why deregulated 'free markets' *cannot* ensure the redistribution of credit through time). As Godley and Lavoie (2007a) explained:

a particular level of government expenditure relative to tax rates, and also relative to GDP, is essential if stable, noninflationary growth and full employment are to be achieved
(Wynne Godley and Marc Lavoie, ^œ[Fiscal Policy in a Stock-Flow Consistent \(SFC\) Model](#) , Levy Economics Institute Working Paper No. 494, April 2007a, p. 3).

Let's not buy into the currently common view that we should take advice on all this from those who have accumulated wealth and, of course, will determinedly and strenuously defend their 'right' to retain it ("it's mine I tell you...mine...mine...mine!!") - the path to plutocracy. ⁷³³

Robert Reich (2014) has summed up the consequences of governmental [failure to redistribute US national wealth](#) through the past several decades:

When billionaires supplant political parties, candidates are beholden directly to the billionaires. And if and when those candidates win election, the billionaires will be completely in charge.
(Robert Reich, ^œ[The New Billionaire Political Bosses](#), March 25, 2014)

In this 21st century, the specter of elected democratic offices both bought and [perverted by plutocrats through 'lobbyists' and other surrogates](#) haunts Western democracies. Sadly, in a capitalist world, 'money talks'. It also [enables the subversion of true democracy](#). Sam Pizzigati, describing yet another Wall Street banker's State gubernatorial campaign, summed it up:

Murphy may... prove to be an excellent governor who moves his state toward significantly greater equality. Or he may prove to be a blundering know-it-all whose incompetence discredits the progressive positions he now champions. Murphy's tenure, in other words, figures to be a crashshoot.

In a deeply unequal America, with wealth concentrated outrageously at our economic summit, we see these sorts of crashshoots all the time. We vote for mega millionaires who say the right things. We hope against hope they'll make these right things happen.

Voters shouldn't have to gamble like this. We need a more equal America. We need a mass movement that fights for one.
(Sam Pizzigati, ^œ[Have We Now Reached Peak Goldman Sachs?](#) Still another Wall Street banker is assuming a position of power in America's political firmament. Could this latest power grab have, for once, a happy ending? *Inequality: Blogging Our Great Divide*, November 09, 2017)

Conclusion

Without controls ensuring the distribution and redistribution of credit through society, wealth, and so power, in capitalist societies, tends, over time, to [concentrate in fewer and fewer hands](#). Any government which abdicates responsibility for ensuring such redistribution is failing in its primary duty of care within a democratic capitalist system.

One of its most important responsibilities is to ensure that adequate credit is available to all sectors and actors within the society and that the wealth of the society (and so, in capitalist societies, manipulative power) is not

concentrated and held in too few hands (however the term 'hands' might be defined).

So, with one hand, governments withdraw wealth from the private sector, and with the other, they 'spend' (or redistribute) a similar quantity of credit to stimulate economic activity. The focuses of taxation (credit withdrawal) and spending reveal a great deal about the social priorities (and secondary ideologies) of those who control this redistribution.

All this has *nothing to do with 'socialism'!* Credit supply and redistribution are necessary functions of the administrators of credit within any society, whatever the locus of economic activity and control in that society.

Questions about the involvement of government in the normal economic life of any community are separate from *and should never be confused with* this primary responsibility of government for the supply and distribution of credit within the society. (This '[redistributive](#)' responsibility is not solely a feature of government within a capitalist society. It is a prime responsibility of any formal or informal system of leadership in communities.)

Chapter 11: 🌩

The Looming Catastrophe: Is this the way our world ends? (Not with a bang but a whimper!)

(📅 Update dates for this chapter)

This is the way the world ends
This is the way the world ends
This is the way the world ends
Not with a bang but a whimper
(T. S. Elliot, *The Hollow Men* (1925))

Of Tipping Points and Early Warnings

Capitalism is an inherently unsustainable system

- The Intergovernmental Panel on Climate Change
- Hydroclimate whiplash : Disasters, both small and large, are happening everywhere
- All that is needed is reshaping of current practices
- Producing and consuming our way into our species' grave

What is happening around the world?

For life, this planet may be as good as it gets

- Hostage to the stupidity of 'leaders' and 'power brokers'

Net Zero by 2050 is insanity: We're heading into a frightening future

The 21st century mantra is "More...More...More!".

Welcome to a pseudo-social interactional world

World Leaders' have settled for 'business-as-usual'

- Cold fusion or LENR is coming: It won't be long!!

CO₂ increase since 1962 is 100 times faster than previous natural increases

Arctic basal melt rates are several orders of magnitude higher than predictions

And it's not just the Arctic! Antarctica is also warming!

It really is 'Global' warming! The tropics are getting hotter!

Entangled in a crisis which is a direct consequence of deregulated capitalism

- How fast are the world's oceans rising?
- What about 'ozone collapse'? We are gambling on being able to control the conditions
- What's happening to the world's oceans?

An unprecedented planet-wide experiment

- It is, I promise, worse than you think! We may see PETM-magnitude extinction and accelerated evolution in as few as 140 years
- Cataclysmic disintegration of planetary terrestrial, marine and freshwater environments
- The myopic stupidity of many who live within the bubble of Western capitalism
- Pressures being placed on groundwater storages around the world.

Temperature Records keep falling 'nor are those [~~five six seven~~ eight... years an anomaly"

- And, of course, there's always methane!

Seizing life's opportunities for profit, 'wealth' and planetary 'power'
My name is Western Capitalist, King of Kings

Of Tipping Points and Early Warnings 🦋

 (20/09/24)

There have been five great mass extinctions in Earth's history. And, as documented in this chapter, we are at the precipice of the sixth. But this will not be a 'natural' disaster - this one is a direct consequence of Western Capitalism.

In order to understand the looming 21st century threat of a disastrous escalation of conditions resulting in 'climate change', 'greenhouse warming' and planetary pollution one needs to understand the nature of 'tipping points' which 'feed' that escalation. As David Armstrong McKay *et al* explain:

Climate tipping points (CTPs) are a source of growing scientific, policy, and public concern. They occur when change in large parts of the climate system - known as tipping elements - become self-perpetuating beyond a warming threshold. Triggering CTPs leads to significant, policy-relevant impacts, including substantial sea level rise from collapsing ice sheets, dieback of biodiverse biomes such as the Amazon rainforest or warm-water corals, and carbon release from thawing permafrost. Nine policy-relevant tipping elements and their CTPs were originally identified by Lenton *et al.* (2008). ...

...Observations have revealed that parts of the West Antarctic ice sheet may have already passed a tipping point. Potential early warning signals of the Greenland ice sheet, Atlantic Meridional Overturning Circulation, and Amazon rainforest destabilization have been detected. Multiple abrupt shifts have been found in climate models. Recent work has suggested that up to 15 tipping elements are now active (Lenton *et al.*, 2019)....

...We show that even the ^œParis Agreement [December 2015] goal of limiting warming to well below 2°C and preferably 1.5°C is not safe as 1.5°C and above risks crossing multiple tipping points. Crossing these CTPs can generate positive feedbacks that increase the likelihood of crossing other CTPs. Currently the world is heading toward ~2 to 3°C of global warming; at best, if all net-zero pledges and nationally determined contributions are implemented it could reach just below 2°C. This would lower tipping point risks somewhat but would still be dangerous as it could trigger multiple climate tipping points.

(David I. Armstrong McKay *et al.*, ^œExceeding 1.5°C global warming could trigger multiple climate tipping points, *Science*, Vol 377, Issue 661, Pp. 1171-80, 9 September 2022)

Once those tipping points are triggered, what humanity does might not matter and global warming might well not stop at 2-3°C. We are proving to be a delusional species which believes that nature will 'honor' our 'good' intentions if we decide to limit warming to 1.5 or 2°C.

While the capitalist era, introduced to the world by Western European peoples over the past 500+ years, has produced a variety of serious problems with which capitalism seems unable to effectively deal, greenhouse effects are the most serious of them all. Emily Judd *et al* have explained:

A long-term geological record of global mean surface temperature (GMST) is important for understanding the history of our planet and putting present-day climate change into context.

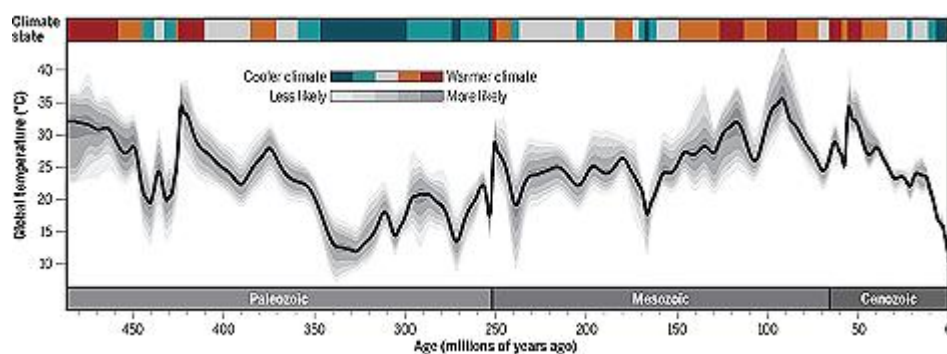

Such a record is necessary for constraining the relationship between climate and other aspects of the Earth system, including the evolution and extinction of life, and the chemistry of the atmosphere and oceans.

Further, quantifying the relationship between GMST and atmospheric carbon dioxide (CO₂) concentrations can refine our understanding of Earth's climate sensitivity and improve future predictions under anthropogenic warming....

Although several Phanerozoic (the last 539 million years) temperature reconstructions exist, during the intensively studied Cenozoic Era (the last 66 million years), they are colder and less variable than individual estimates from key time periods, particularly during ice-free (greenhouse) intervals. This discrepancy suggests that existing Phanerozoic temperature records may underestimate past temperature change, and merits further investigation using a new approach....

We find that Earth's temperature has varied more dynamically than previously thought and that greenhouse climates were very warm. CO₂ is the dominant driver of Phanerozoic climate, emphasizing the importance of this greenhouse gas in shaping Earth history. The consistency of apparent Earth system sensitivity (~8°C) is surprising and deserves further investigation.

More broadly, PhanDA [a reconstruction of global mean surface temperature spanning most of the Phanerozoic Eon] provides critical context for the evolution of life on Earth, as well as present and future climate changes.

PhanDA global mean surface temperature across the last 485 million years

The gray shading corresponds to different confidence levels, and the black line shows the average solution.

The colored bands along the top reflect the climate state, with cooler colors indicating icehouse (coolhouse and coldhouse) climates, warmer colors indicating greenhouse (warmhouse [25-28°C] and hothouse [28-36°C]) climates, and the gray representing a transitional state,

[Average tropical surface air temperatures...are highly variable... ranging from 22° to 31°C (median = 27°C) during icehouse intervals to 32° to 42°C (median = 36°C) during greenhouse intervals].

(Emily J. Judd *et al*, ^{oe}[A 485-million-year history of Earth's surface temperature](#), *Science*, Vol 385, Issue 6715, 20 September 2024)

Of course, though CO₂ is commonly used as short-hand for the consequences of all greenhouse gasses, it is important, as we will discover,

to [consider the cumulative contribution of a variety of gasses](#) being emitted in this capitalist age.

The world is fast heading for disaster. But this is not a disaster that has come upon us unawares! Those most directly involved in creating the conditions for this disaster to occur have been aware of the consequences of their activities for more than a hundred years:

On 18 May 1859, the Irish physicist John Tyndall wrote in his journal 'the subject is completely in my hands'. This is no cryptic note. Just nine days earlier he had set up his complex and clever new apparatus at the Royal Institution in London to try to detect the absorption of heat by gases. Now, he had done it. And as far as he knew, no-one had done it before him....

He had demonstrated the physical basis of the greenhouse effect. And he knew what he had shown. He wrote: "Thus the atmosphere admits of the entrance of solar heat; but checks its exit, and the result is a tendency to accumulate heat at the surface of the planet".

(Roland Jackson, ^œ[Who discovered the greenhouse effect?](#) *The Royal Institution*, 17 May, 2019)

By the 1970s major greenhouse gas polluters had commissioned the research and received the studies (including the obligatory one page 'executive summaries') demonstrating their responsibility. As Supran, Rahmstorf and Oreskes explain:

In 2015, investigative journalists discovered internal company memos indicating that Exxon oil company has known since the late 1970s that its fossil fuel products could lead to global warming with "dramatic environmental effects before the year 2050."

Additional documents then emerged showing that the US oil and gas industry's largest trade association had likewise known since at least the 1950s, as had the coal industry since at least the 1960s, and electric utilities, Total oil company, and GM and Ford motor companies since at least the 1970s.

Scholars and journalists have analyzed the texts contained in these documents, providing qualitative accounts of fossil fuel interests' knowledge of climate science and its implications.

In 2017, for instance, we demonstrated that Exxon's internal documents, as well as peer-reviewed studies published by Exxon and ExxonMobil Corp scientists, overwhelmingly acknowledged that climate change is real and human-caused.

By contrast, the majority of Mobil and ExxonMobil Corp's public communications promoted doubt on the matter.

(G. Supran, S. Rahmstorf and N. Oreskes, ^œ[Assessing ExxonMobil's global warming projections](#), *Science*, January 13, 2023)

Of course those self-serving ^œ[corporations and their CEOs should be made to pay](#). Of course it is only fair that they should be held accountable for the consequences of their myopic greed.

But it really is too late to divert attention from looming world-wide catastrophes to seek 'revenge'. We are all responsible and we must all accept that to avert disaster will require a major diversion of resources and talent and mobilization of entire populations to address the problems we have all been party to creating.

In 2023 we are already ^œ[seeing what awaits humanity](#) over coming decades. After more than a hundred years of unambiguous warnings, during which Western capitalists have blithely continued their planet-wide ecosystem pillage, human beings around the world are experiencing the early stages of the outcome of their myopic, [sociopathic irresponsibility](#):

The men of the Masai village of Tipilit, a collection of twenty mud huts standing in the dry lands that encroach upon the Amboseli National Park in Kenya, greet their visitors with a haunting song that rises and deepens in the evening sun. Their polyphonic rhythm is arresting and sinuous, but also wields a hidden sadness. These songs are usually sung during the times of rain. And this year, those rains may never come.

On Thursday, 400 km away in Mombasa on the Kenyan coast, a meeting of climate experts and sectoral stakeholders announced the dire prediction that millions of Africans may never again get the rains they so desperately need.

The 62nd Greater Horn of Africa Climate Outlook Forum (GHACOF) ended its three-day session with the words: "we have never seen anything like this - five seasons of drought".

"You should even wonder if you can call it a rainfall season," the committee concluded. It "will be devastating" for countless numbers of East Africans living through the longest drought in decades.

A joint statement by other metrological partners, including the UK Met Office, in May of this year had predicted the October-December 2022 rainy season could fail. Now, that forecast has been confirmed.

This news will be devastating to vast swathes of communities in the Horn of Africa facing the threat of starvation following four consecutive failed rainy seasons in parts of Ethiopia, Kenya and Somalia. It is a climatic event not seen in at least 40 years.

(Iain Overton, ^œ['I Do Not Know If My People Will Survive': A Fifth Year of Drought Is Coming to East Africa](#), *Byline Times*, 26 August 2022)

And, in Pakistan:

Striking new satellite images that reveal the extent of Pakistan's record flooding show how an overflowing Indus River has turned part of Sindh Province into a 100 kilometre-wide inland lake.

Swaths of the country are now underwater, after what United Nation officials have described as a "monsoon on steroids" brought the heaviest rainfall in living memory and flooding that has killed 1,162 people, injured 3,554 and affected 33 million since mid-June.

The new images, taken on Aug. 28 from NASA's MODIS satellite sensor, show how a combination of heavy rain and an overflowing Indus River have inundated much of Sindh province in the South.

In the centre of the picture, a large area of dark blue shows the Indus overflowing and flooding an area around 100 kilometres (62 miles) wide, turning what were once agricultural fields into a giant inland lake.

(Brandon Miller, Judson Jones, Sophia Saifi and Kathleen Magramo, ^œ[Pakistan's deadly floods have created a massive 100 km-wide inland lake, satellite images show](#), *CTV News*, Aug. 31, 2022)

And these are but a random sample of dozens of similar 2022 disasters which portend what is awaiting our species over coming decades.⁷³⁴

Capitalism is an inherently unsustainable system 🐼

We, Western Capitalists, [intent on increasing our 'weath'](#), have displayed remarkable equanimity in the face of mounting evidence that our activities are causing what is increasingly obviously an environmental emergency - soon to be a disaster!

The problem is not merely one of 'greenhouse gas emissions': [Capitalism is an inherently unsustainable system](#).

The *presumed* solution to the looming 'greenhouse' catastrophe requires [finding alternative means of fueling 'necessary' 'economic development'](#). Vast resources are being committed to research and development of 'alternative' energy sources.

Manufacture and deployment of those alternatives require not only access to energy but also burgeoning access to scarce resources. Though this seldom seems to be recognized, let alone addressed, like all manufactured products, there will have to be a built-in schedule of expansion (to meet future 'needs'), maintenance and replacement with concomitant access and development of needed resources.⁷³⁵

Jens Glüsing *et al* have explained:

There are great hopes that the green technology can be used to help save the climate, but that rescue also entails stripping the planet of precious resources. And this is the paradox behind what is currently the most important project of the industrialized world: the global energy transition.

The dilemma, which is becoming increasingly apparent, is also on the minds of the 25,000 or so delegates at the World Climate Conference currently taking place in Glasgow.

Deposits in the poor South are being exploited so that the rich North can transition to environmental sustainability. At least to a lifestyle that appears sustainable. Mathis Wackernagel, a resource researcher who lives in California, describes it as a disastrous development. "We haven't quite thought the future through," he says.

(Jens Glüsing *et al*, [Mining the Planet to Death: The Dirty Truth About Clean Technologies](#), *Spiegel International*, November 04, 2021)

George Hay has elaborated:

COP26 has a blind spot. The prime ministers and corporate bigwigs gathered in Glasgow want to cut demand for the fossil fuels that constitute most of the world's greenhouse gas emissions. To make that happen without crashing the economy, there has to be lots more of the metals underpinning a greener society.

Along with phasing out coal and reducing deforestation, COP26 needs to champion electric vehicles and spur investment in renewable energy. That means more wind turbines, solar panels, energy storage and charge points. That in turn means more aluminium, cobalt, copper, lithium and nickel.

Consultant Wood Mackenzie has [run the numbers](#). Limiting global warming to 2 degrees Celsius above preindustrial levels implies 19

million tonnes of additional annual copper production by 2030, a 60% increase. Aluminium supply needs to jump 30%, nickel 50%, and lithium and cobalt 140% and 150% respectively. Limiting warming to 1.5 degrees Celsius implies an even greater supply hike.

Normally this would be an epic green light for miners to get digging. After an iron ore boom, giants like BHP (BHP.AX), (BHPB.L) and Rio Tinto (RIO.L), (RIO.AX) are awash with cash. But the gap between the investment that's needed over the next 15 years and what's signed off is almost \$2 trillion, Wood Mackenzie says.

(George Hay, ^œ[Forget COP26. The world needs COPPER 26](#), *Reuters*, November 5, 2021)

In November 2022 we're on the cusp of disaster (of both the 'bang' and the 'whimper' varieties) but, fear not! Our 'leaders' and 'diplomats' are about to 'deliver'! They're gathering in Egypt for COP27. This time the world's leaders will be 'Delivering for people and the planet'.

Previous talkfests were merely prelude:

From 6 to 18 November [2022], Heads of State, ministers and negotiators, along with climate activists, mayors, civil society representatives and CEOs will meet in the Egyptian coastal city of Sharm el-Sheikh for the largest annual gathering on climate action.

The 27th Conference of the Parties to the United Nations Framework Convention on Climate Change - COP27 - will build on the outcomes of COP26 to deliver action on an array of issues critical to tackling the climate emergency - from urgently reducing greenhouse gas emissions, building resilience and adapting to the inevitable impacts of climate change, to delivering on the commitments to finance climate action in developing countries.

Faced with a growing energy crisis, record greenhouse gas concentrations, and increasing extreme weather events, COP27 seeks renewed solidarity between countries, to deliver on the landmark Paris Agreement, for people and the planet.

(*United Nations*, ^œ[COP 27: Delivering for people and the planet](#), (accessed 05 November, 2022))

It might be true, as UN Secretary-General ^œ[António Guterres insisted on 27 October 2022](#), that

Droughts, floods, storms and wildfires are devastating lives and livelihoods across the globe.

Loss and damage from the climate emergency is getting worse by the day.

And global and national climate commitments are falling pitifully short.

The window to limit global temperature rise to 1.5 degrees is closing fast.

Greenhouse gas emissions must be cut by 45 per cent this decade.

But as today's emissions gap report confirms, they remain at dangerous and record highs and still rising.

Under current policies, the world is headed for 2.8 degrees of global heating by the end of the century.

In other words, we are headed for a global catastrophe.

But, the world will remember that in November 2022, its leaders 'led'.
Miraculously, they 'solved the problem'! and averted planetary disaster!

After all that's what leaders are there for!!

COP27 came and went! Nothing happened but, then, given [all the mayhem and carnage to which the world has been witness in 2023](#), it would be unrealistic to expect 'our leaders' to do much about the Climate! But, there's always COP28!

COP28 has come and gone. Clearly Big Business is getting worried, they flooded the conference with delegates, most of them dressed in the fine woven suits of 'serious' business people! Surely that must mean that they expect momentous decisions affecting them are likely!

As Caroline Muturi, a coordinator at the campaign group Ibon Africa, explained:

...Cops have become an avenue for these corporations to greenwash their polluting businesses and foist dangerous distractions from real climate action.

Nina Lakhani, summed up COP28:

KBPO is a coalition of more than 450 organisations across the world calling for an end to fossil fuel companies' influence in climate policy. After years of pressure for greater transparency, the UN caved and this year required applicants to declare who they represent, which may partly explain the rise in oil and gas lobbyists, as they may previously have attended previous Cops incognito.

The data on lobbyists was compiled by the organisations Corporate Accountability, Global Witness and Corporate Europe Observatory from the UN's provisional list of about 84,000 participants at Cop28, and is the most in-depth study into fossil fuel industry presence at any talks to date. It found:

- Fossil fuel lobbyists received more passes than the combined total of delegates (1,609) from the 10 most climate vulnerable countries combined, including Somalia, Chad, Tonga, Solomon Islands and Sudan.
- Many fossil fuel lobbyists were granted access as part of a trade association, of which nine of the 10 largest came from the global north. This included the Geneva-based International Emissions Trading Association, which brought 116 people including representatives from Shell, TotalEnergies and Norway's Equinor.

The sharp rise in industry lobbyists is perhaps unsurprising given recent revelations that the host country planned to use climate meetings with other countries to promote deals for its national oil and gas companies.

The Cop president, Sultan Al Jaber, was recorded claiming there was "no science" indicating that a phase-out of fossil fuels is needed to restrict global heating to 1.5C (2.7F) above preindustrial levels. (Nina Lakhani, ^{oe}[Record number of fossil fuel lobbyists get access to Cop28 climate talks: UAE-hosted summit admitted at least 2,456 people affiliated with oil and gas industries, analysis finds, *The Guardian*, December 05, 2023](#))

And, in late November 2024, COP29 did the same! This time the 'fossil fuel' lobbyists set its agenda and determined its outcomes. Sad to say, it's now all too late. If you haven't already experienced the inevitable consequences of our myopia, I can, from personal experience, assure you that you very soon will!

How long will it take 'World Leaders' to realize that any long-term solution to the problems confronting them will require a massive reduction in energy use? Attempting merely to maintain existing energy requirements is no longer sustainable, much less, the continued exponential expansion of energy requirements to allow the 'rest of the world' to 'catch up' with the developed nations

Yes, it's not fair! Those responsible for abusing and misusing the world's populations, environments and resources and creating the insurmountable problems with which humanity is confronted are 'already developed'.

Now they, inevitably, insist that those they have abused must suffer the consequences of their profligacy! But there really is no alternative!! And, most unfairly of all, they will smugly insist on this because "we're all in this together"

Kelly Sims Gallagher has explained the problem:

In the struggle to combat climate change, the world is fighting the last war. Since the dawn of the Industrial Revolution, countries have released one and a half trillion metric tons of carbon dioxide into the atmosphere.

The largest cumulative emissions have come from the United States, European countries, China, and Russia, in that order. But these countries are now prosperous enough to pay for policies that can place them on the path to net-zero emissions by midcentury.

The top emitting countries of the future could come largely from the developing world - countries such as Brazil, India, Indonesia, and South Africa, which face the herculean task of bringing millions out of poverty while simultaneously adapting to the harsh realities of climate change.

If industrialized countries do not shoulder the responsibility to help prevent this next wave of emissions, the global effort to avoid climate disruption will fail.

Efforts to ensure that today's largest polluters rapidly curb their emissions are vitally important, but this progress risks being erased if poorer countries find it impossible to pursue a low-carbon development strategy.

In order to simultaneously preserve the environment and help lift hundreds of millions of people out of poverty, rich countries must provide financing and policy support at a scale that has so far been unavailable to poorer countries.

There are roughly two dozen emerging economies across the globe that are poised to expand their greenhouse gas emissions dramatically in the near future if they do not receive this assistance. Their population size, rapid economic growth rates, and reliance on fossil fuels have placed them on a trajectory for a dramatic expansion of their emissions.

Together, they could cause the same massive wave of emissions that China produced during the first two decades of this century, when it released 195 billion metric tons of greenhouse gases into the atmosphere.

This would render impossible the efforts to reach global "net zero" by midcentury, which scientists say is necessary to avoid the worst effects of climate change.

(Kelly Sims Gallagher, ^œ[The Coming Carbon Tsunami: Developing Countries Need a New Growth Model - Before It's Too Late](#), *Foreign Affairs*, Vol.101, No.1, January/February 2022)

There can no longer be room for complacency.

The Intergovernmental Panel on Climate Change

The Intergovernmental Panel on Climate Change (IPCC) released an interim report on 7 August 2021 entitled ^œ[Climate Change 2021: The Physical Science Basis](#) and subtitled 'Working Group I contribution to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change'. It provides an inevitably cautious and conservative assessment of

...[T]he current state of the climate, including how it is changing and the role of human influence, the state of knowledge about possible climate futures, climate information relevant to regions and sectors, and limiting human-induced climate change.[SPM-4]

The nature of the IPCC (reflecting not only the consensus findings of research on the issues it addresses but also the views of governmental representatives (195 nations) around the world on the manner in which those findings are presented) should be considered a product not only of scientific but also political and industry assessments of draft versions of reports.

As a result of this form of extensive consultation and critique, IPCC reports should be viewed not as the most 'likely' outcome of current climate developments around the world but as cautious, conservatively filtered and limited assessments of possible outcomes. A common criticism of IPCC reports has been that they, by presenting conservative estimates of the consequences of climate change, reduce the impetus to action which such reports should stimulate.

That is not the purpose of information presented in this chapter. Its purpose is to provide credible, usually peer-reviewed, research describing and explaining emerging globally significant climatic and environmental conditions and trajectories. The reader is left with the task of comparing and contrasting what has been presented with ongoing research on the issues. As new studies emerge, of course, they will be woven into the text to provide explanations of the trajectories of change and consequent possibilities of social and environmental disruption.

We are on the cusp of environmental and social changes greater than any experienced in the history of homo sapiens on this planet and there are highly credible studies outlining their possibly disastrous consequences for humanity. It would be delinquent not to highlight such possibilities and warn of looming disaster.

Conservative assessments of climatic and environmental trajectories are calculated to minimize 'alarmist' conclusions. Here it is presumed that it is long-past time to introduce a little panic into the conversation!

We are going to have to get used to new sets of terms shortanding reality over the next few decades. Among those terms will, inevitably, be a number describing climate-induced relocation. Brad Wible has summarized:

Climate-induced relocation. Managed retreat. Facilitated migration. Climate-related displacement. These terms describe aspects of what may be beyond words to millions of people whose homes, communities, and cultures are, or could soon be, profoundly threatened by climate change. These people must decide whether, where, when, and how to move, and to thrive, out of harm's way. Communities facing an influx of uprooted people are no less challenged. Although no single term has been legally defined and universally accepted to describe people on the move as a result of environmental drivers, the global community has made commitments to support them.⁷³⁶

Most people living in Western communities still believe that, while 'climate change might be happening', it will not impact their lives. In my region of the world, this is increasingly looking like self-delusion.

Hydroclimate whiplash: Disasters, both small and large, are happening everywhere 🌊

 (18/04/24) (22/06/24) (10/01/25) (12/01/25)

Communities which, in the past, thought themselves safe from natural catastrophe, have found that they aren't. Wild fires and wild weather have uprooted thousands who had assumed that this would never happen to them; that this was something that happened in remote parts of the world which they voyeuristically watched, in graphic detail, on their entertainment media.

No longer! Disasters, both small and large, are happening everywhere. Where does one go, and ^œ[what does one do to insulate oneself from them?](#) Any place to which the uprooted might flee will, sooner or later, be prone to similar disaster.

Welcome to humanity's future!⁷³⁷

Virginia Iglesias *et al* have discussed the growing likelihood of 'losses [in the US] from natural hazards [which] are escalating dramatically, with more properties and critical infrastructure affected each year':

... Although the magnitude, intensity and/or frequency of certain hazards has increased, development contributes to this unsustainable trend, as disasters emerge when natural disturbances meet vulnerable assets and populations.... [W]e identified earthquake, flood, hurricane, tornado, and wildfire hazard hotspots, and overlaid them with land-use information from the Historical Settlement Data Compilation dataset.

Our results show that 57% of structures (homes, schools, hospitals, office buildings, etc.) are located in hazard hotspots, which represent only a third of CONUS [conterminous United States] area, and ~1.5 million buildings lie in hotspots for two or more hazards.

These critical levels of exposure are the legacy of decades of sustained growth and point to our inability, lack of knowledge, or unwillingness to limit development in hazardous zones. Development in these areas is still growing more rapidly than the baseline rates for the nation, portending larger future losses even if the effects of climate change are

not considered.

(Virginia Iglesias *et al*, ^{ae}[Risky development: Increasing exposure to natural hazards in the United States](#), *Earth's Future*, 08 June 2021)

With so many governments paying lip-service to the need for policies aimed at mitigating the consequences of 'climate-change', many are allowing continued settlement development in vulnerable areas. The real consequences of climate change are much closer than many people, including politicians and planners, actually believe!

The Arctic provides the clearest evidence of what is happening - but it is merely an exemplar of conditions around the world. What starts in the Arctic (and Antarctic) does not stay in those regions, these conditions foretell our imminent future!

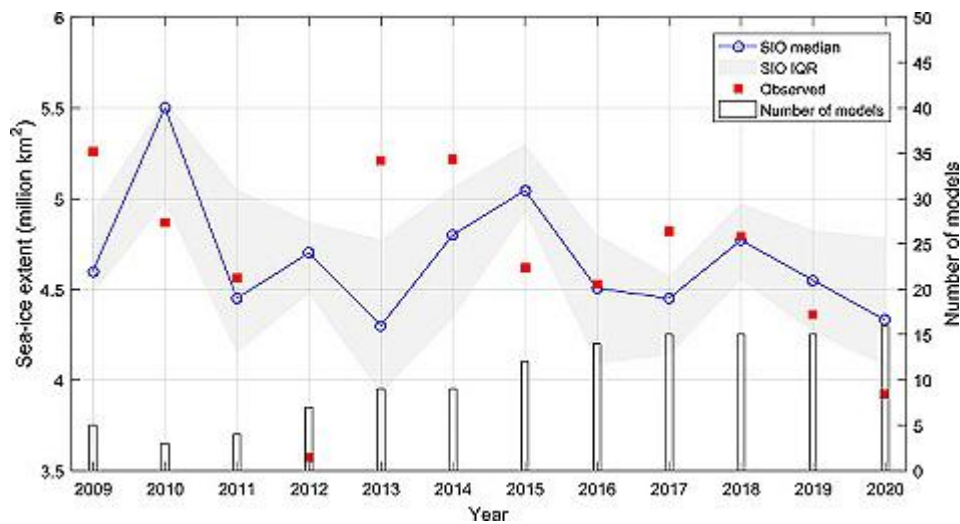

The 2021 summary of Arctic conditions and trends (published by AMAP, established in 1991 under the eight-country Arctic Environmental Protection Strategy) titled ^{ae}[Arctic Climate Change Update 2021: Key Trends and Impacts](#), provides a somber picture of air temperature (and many other) changes in the Arctic between 1971 and 2019:

From 1971-2019, the annually averaged Arctic near-surface air temperature increased by 3.1°C, three times faster than the global average. This finding is based on instrumental data, with interpolation applied over the Arctic Ocean where observations are sparse, and is higher than the increase reported in previous AMAP reports. The largest change in air temperature over this 49-year period was over the Arctic Ocean during the months of October through May, averaging 4.6°C with a peak warming of 10.6°C occurring over the northeastern Barents Sea.

Ke Wei *et al* described 2020 Arctic conditions - they are no longer associated with clear weather anomalies: 'during the melting season of 2020, there was no powerful cyclone, and the sea surface temperature of the equatorial central and eastern Pacific was neutral':

On 15 September 2020, the Arctic sea-ice extent (SIE) reached its annual minimum, which, based on data from the National Snow and Ice Data Center (NSIDC, 2020a), was about 3.74 million km² (1.44 million square miles). This value was about 40% less than the climate average (~6.27 million km²) during 1980-2010. It was second only to the record low (3.34 million km²) set on 16 September 2012, but significantly smaller than the previous second-lowest (4.145 million km², set on 7 September 2016) and third-lowest (4.147 million km², set on 14 September 2007) values, making 2020 the second-lowest SIE year of the satellite era (42 years of data).

Although ranked second lowest, the year 2020 carries special meaning. In August 2012, the Arctic experienced the Great Arctic Cyclone, which was the most extreme cyclone in summer on record since the beginning of the satellite era, reaching the level of strong cyclones in winter (Simmonds and Rudeva, 2012). It led to a dramatic reduction in Arctic sea ice and thus set the historical record still standing today. In 2015/16, the occurrence of a super El Niño was linked to extremely warm anomalies in the Arctic, which affected sea-ice loss (Petty *et al.*, 2018; Stroeve and Notz, 2018). By contrast, during the melting season of 2020, there was no powerful cyclone, and the sea surface temperature of the equatorial central and eastern Pacific was neutral (La Niña had been developing since autumn).

The median and interquartile range (IQR) of the September Arctic Sea Ice Outlook (SIO) based on the July predictions of dynamical models that participated in the Sea Ice Prediction Network.

(Ke Wei *et al*, [Subseasonal to seasonal Arctic sea-ice prediction: A grand challenge of climate science](#), *Atmospheric and Oceanic Science Letters*, 2 April 2021)

(Join the dots!)

Robert Graham *et al*, in 2017, described the frequency with which 'extreme warming events were observed over sea ice in the central Arctic Ocean. Each of these warming events were associated with temperatures close to or above 0°C, which lasted for between 1 and 3 days'. As they explain,

Temperatures in the Arctic are increasing twice as fast as the global average.... The most rapid Arctic warming has been recorded during the winter months..., and 2015-2016 was the warmest winter since records began in 1950.... Winter 2015-2016 featured an Arctic wide (north of 66°N) winter temperature anomaly of approximately 5°C, which was 2°C warmer than the previous record.... The winter maximum sea ice extent in March 2017 was the lowest in the 38 year satellite record (<http://nsidc.org/arcticseaicenews/>). March 2016 and March 2015 were the joint lowest, prior to 2017...

(Robert M. Graham *et al*, [Increasing frequency and duration of Arctic winter warming events](#). *Geophysical Research Letters*, 10 July 2017 [references omitted])

Matthew Cappucci, in a March 16, 2022 *Washington Post* report on recent events, described recent Arctic winter atmospheric warming:

Temperatures averaged over the high Arctic north of 80 degrees latitude are about 25 degrees (14 Celsius) above normal. Some forecast models indicate small areas in the Arctic, including near the North Pole, could experience temperatures as much as 45 to 54 degrees (25 to 30 Celsius) above normal Wednesday and Thursday.

In Hopen, an island off Svalbard in the Barents Sea at 76 degrees north latitude, the temperature recently hit 39 degrees (3.9 Celsius), its highest March temperature on record....

"It appears that a new record has been set for lowest pressure on record anywhere in Greenland at 934.1 hPa measured at the [Danish Meteorological Institute] station at Ikermiuarssuk," Mottram said. The pressure reading hasn't been officially certified as a record, but Mottram notes that it is consistent with other observations and model forecasts.

(Matthew Cappucci, ^œ[Record 'bomb cyclone' bringing exceptional warmth to North Pole: Arctic temperatures could approach the melting point as they surge nearly 50 degrees above normal](#), *Washington Post*, March 16, 2022)

And, it's not only happening in the Arctic!

As in the Arctic, so in the Antarctic, sea-ice extent is declining. The *National Snow and Ice Data Center* described what is happening:

Antarctic sea ice recently reached its late-summer minimum, dropping below all previous minimum ice extents in the satellite record.... For the first time since the satellite record began in 1979, extent fell below 2 million square kilometers (772,000 square miles), reaching a minimum extent of 1.92 million square kilometers (741,000 square miles) on February 25. Ice extent declined at a near-average rate through most of the month at about 40,000 square kilometers (15,400 square miles) per day, but the decline significantly slowed to about 15,000 square kilometers (5,800 square miles) per day towards the end of the month.

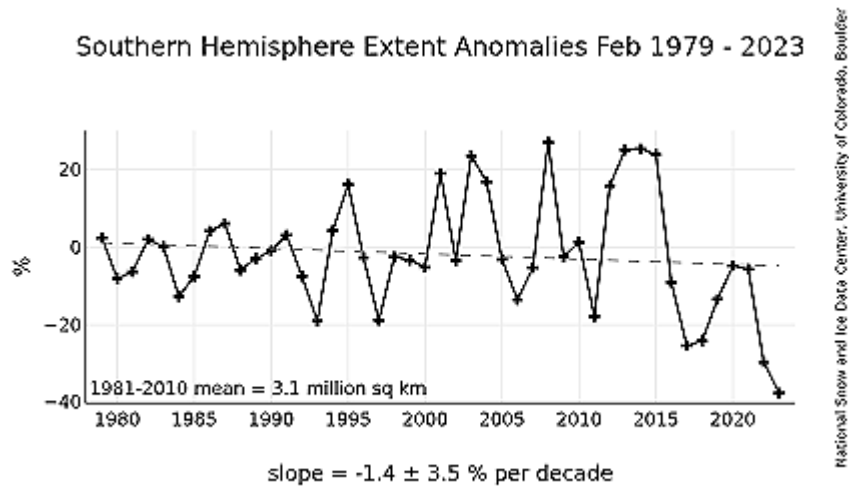

(^œ[Arctic sea ice approaches maximum; record low minimum in the south](#), *National Snow and Ice Data Center*, March 8, 2022)

Jinfei Wang *et al* summed up what happened:

SIE [sea ice extent] reached a new record low since recordkeeping began in 1978 of 1.9 million km² on 25 February, 0.17 million km² lower than the previous record low set in 2017. One reason for this is that the Antarctic sea ice retreated earlier than normal, starting from early September of 2021. The negative anomalies became larger until mid-November, and then sea ice exhibited a steadily decreasing rate until mid-December of 2021 and dropped quickly, exceeding two standard deviations (SDs) of the climatology, on 8 February 2022. (Jinfei Wang *et al*, ^œ[An Unprecedented Record Low Antarctic Sea-ice Extent during Austral Summer 2022](#), *Advances in Atmospheric Sciences*, April 19, 2022)

And, of course, in 2023, The *National Snow and Ice Data Center* reported that:

On February 13, 2023, Antarctic sea ice extent fell to 1.91 million square kilometers (737,000 square miles) (Figure 1a). This set a new record low, dropping below the previous record of 1.92 million square kilometers (741,000 square miles) set on February 25, 2022 (Figure 1b). This year represents only the second year that Antarctic extent has fallen below 2 million square kilometers (772,000 square miles). In past years, the annual minimum has occurred between February 18 and March 3, so further decline is expected.

(^{oe}[Antarctic Sea Ice Extent sets a new record low](#), *National Snow and Ice Data Center*, February 14, 2023)

Bob Henson, in a *Yale Climate Connections* article entitled 'How this month produced a mind-boggling warm-up in eastern Antarctica (and the Arctic)', has described the seeming 'coincidence' of extreme heat events in both the Arctic and Eastern Antarctic regions in March 2022. As he describes:

The bloodless term "anomaly" doesn't do justice to the stupendous temperature departures seen across parts of both the Antarctic and Arctic in mid-March 2022. With the initial shock now behind them, scientists are taking stock of exactly what happened and what it might portend.

The observations from both polar regions - especially the Antarctic - would be almost laughable if they weren't so unsettling. Even as some of the scientists working in these remote areas shared humorous takes on the bizarre warm-ups, one could find plenty of angst, as temperatures in the Antarctic soared to levels that were in some cases virtually unthinkable just a few days beforehand.

The Arctic's warm spell was impressive in its own right. An atmospheric river (or AR, a narrow plume of warmth and moisture that typically pushes toward higher latitudes) surged from the North Atlantic well into the Arctic Ocean on a track running just east of Greenland. The AR was associated with a powerful mid-latitude cyclone that produced the lowest atmospheric pressure ever recorded in Greenland: 934.1 mb at Ikermiarsuk, beating a value of 936.2 mb set at two locations in 1986 and 1988....

Even more impressive was the freakish warming at Earth's South Pole. An atmospheric river originating near southeast Australia surged across much of the vast, barren landscape of East Antarctica, the coldest large plateau on the planet.

"This Antarctic heat wave definitely changes what we thought was possible for Antarctic weather," tweeted Jonathan Wille (Université Grenoble Alpes)....

East Antarctica doesn't get gradual springs and autumns, to put it mildly. Instead, months of winter darkness switch abruptly into summers with near-constant sunshine and temperatures still frigid but far warmer than in winter. The winter cool-down arrives only a few weeks later.

In the case of March 2022, just days before the southern autumn equinox of March 20 - a time when temperatures have normally plunged close to winter levels - the atmospheric river spread warmth-trapping clouds and moisture well inland across East Antarctica.

As a result, temperatures soared to levels as much as 50°F [28°C] or more above average over broad areas on March 18 and remained far above average for several days....

Above all, what the twin polar warmings reinforce is that, more than ever, we can expect the unexpected in a warming atmosphere. Wille likened the extremity of the Antarctic warm-up to the similarly out-of-bounds heat observed in the Pacific Northwest and British Columbia in the summer of 2021, with both occurrences seemingly implausible until they happened.

"For me, it's hard to feel surprised by events like this anymore," Schneider wrote in an email. He pointed out that studies of past climate indicate that, at times when atmospheric carbon dioxide concentrations were similar to their current values of around 420 parts per million, the Antarctic Ice Sheet was significantly smaller....

(Bob Henson, [How this month produced a mind-boggling warm-up in eastern Antarctica \(and the Arctic\): Two atmospheric rivers surge toward opposite poles](#), *Yale Climate Connections*, March 23, 2022)

And, on March 23, 2022, an East Antarctic ice shelf collapsed:

It is relatively common for ice shelves in Antarctica to spawn icebergs. It is less common for an ice shelf to completely disintegrate. In March 2022, an ice shelf in East Antarctica did both. The collapse has reshaped a part of the Antarctic landscape where coastal glacial ice was once thought to be stable.

The change happened fast. At the start of March 2022, the floating shelf fed by the Glenzer and Conger glaciers was still intact. By the middle of the month, it had fallen apart....

The loss of an ice shelf is problematic because it can indirectly contribute to sea level rise. "Ice shelves are essentially the 'safety band' holding up the rest of the Antarctic Ice Sheet," Walker said. When they collapse, the ice behind them can more quickly flow into the ocean. "And that is what raises sea levels."

By Antarctic standards, the ice shelf and glaciers that it held back are relatively small, so the impacts from the collapse are expected to be minimal. Scientists are more concerned about the location of the collapse.

"All of the previous collapses have taken place in West Antarctica, not East Antarctica, which until recently has been thought of as relatively stable," Walker said. "This is something like a dress rehearsal for what we could expect from other, more massive ice shelves if they continue to melt and destabilize. Then we'll really be past the turnaround point in terms of slowing sea level rise."

(Kathryn Hansen, [Ice Shelf Collapse in East Antarctic](#), *NASA Earth Observatory*, March 29, 2022)

Wenxia Zhang *et al*, in a study entitled '2023: Weather and Climate Extremes Hitting the Globe with Emerging Features', examine the impact of 'extreme weather and climate events throughout the world'. As they summarize:

Globally, 2023 was the warmest observed year on record since at least 1850 and, according to proxy evidence, possibly of the past 100 000 years. As in recent years, the record warmth has again been accompanied with yet more extreme weather and climate events throughout the world.

Here, we provide an overview of those of 2023, with details and key background causes to help build upon our understanding of the roles of internal climate variability and anthropogenic climate change. We also highlight emerging features associated with some of these extreme events.

Hot extremes are occurring earlier in the year, and increasingly simultaneously in differing parts of the world (e.g., the concurrent hot extremes in the Northern Hemisphere in July 2023). Intense cyclones are exacerbating precipitation extremes (e.g., the North China flooding in July and the Libya flooding in September).

Droughts in some regions (e.g., California and the Horn of Africa) have transitioned into flood conditions. Climate extremes also show increasing interactions with ecosystems via wildfires (e.g., those in Hawaii in August and in Canada from spring to autumn 2023) and sandstorms (e.g., those in Mongolia in April 2023).

Finally, we also consider the challenges to research that these emerging characteristics present for the strategy and practice of adaptation.

(Wenxia Zhang *et al*, [2023: Weather and Climate Extremes Hitting the Globe with Emerging Feature](#), *Advances in Atmospheric Sciences*, 17 April 2024)

As has been observed by many commentators already, in June 2024, at the start of the northern hemisphere summer, extreme heat is building fast. The phrase 'off the charts' is becoming commonplace. A *Copernicus Climate Change* site described the situation in May 2024:

May 2024 was warmer globally than any previous May in the data record, with an average ERA5 surface air temperature of 15.91°C, 0.65°C above the 1991-2020 average for May and 0.19°C above the previous high set in May 2020. This is the twelfth month in a row that is the warmest in the ERA5 data record for the respective month of the year. While unusual, a similar streak of monthly global temperature records happened previously in 2015/2016. The month was 1.52°C above the estimated May average for 1850-1900, the designated pre-industrial reference period.

The global-average temperature for the past 12 months (June 2023 - May 2024) is the highest on record, at 0.75°C above the 1991-2020 average and 1.63°C above the 1850-1900 pre-industrial average. The average European temperature for May 2024 was 0.88°C above the 1991-2020 average for May, making the month the third warmest May on record for the continent. European temperatures were most above average over northern regions, but below average over Russia and parts of the south-west and south-east of the continent.

Outside Europe, temperatures were most above average over northern Canada, central America and parts of Africa, Asia and Antarctica. Temperatures were below average over the eastern equatorial Pacific, indicating a developing La Niña, but air temperatures over the ocean remained at an unusually high level over many regions.

The sea surface temperature (SST) averaged for May 2024 over 60°S - 60°N was 20.93°C, the highest value on record for the month. This is the fourteenth month in a row that the SST has been the warmest in the ERA5 data record for the respective month of the year.
([∞][Surface air temperature for May 2024](#), Copernicus Climate Change Service, accessed June 22, 2024)

Around the world, the rise in global mean sea surface temperatures (GMSST) is accelerating. Christopher Merchant *et al* have described what is happening

...[T]he underlying rate of change of GMSST rises in proportion with Earth's energy accumulation from 0.06 K decade⁻¹ during 1985-89 to 0.27 K decade⁻¹ for 2019-23. While variability associated with the El Niño Southern Oscillation triggered the exceptionally high GMSSTs of 2023 and early 2024, 44% (90% confidence interval: 35%-52%) of the +0.22 K difference in GMSST between the peak of the 2023/24 event and that of the 2015/16 event is unexplained unless the acceleration of the GMSST trend is accounted for. Applying indicative future scenarios of EEI based on recent trends, GMSST increases are likely to be faster than would be expected from linear extrapolation of the past four decades. Our results provide observational evidence that the GMSST increase inferred over the past 40 years will likely be exceeded within the next 20 years. Policy makers and wider society should be aware that the rate of global warming over recent decades is a poor guide to the faster change that is likely over the decades to come, underscoring the urgency of deep reductions in fossil-fuel burning.

(Christopher J Merchant *et al*, [∞][Quantifying the acceleration of multidecadal global sea surface warming driven by Earth's energy imbalance](#), *Environmental Research Letters*, Vol. 20, No. 2, 28 January 2025)

We're entering a world driven by, as Daniel Swain *et al* suggest, 'Global hydroclimate whiplash events'.

Global weather records show hydroclimate whiplash has swelled globally by 31% to 66% since the mid-20th century, the international team of climate researchers found - even more than climate models suggest should have happened. Climate change means the rate of increase is speeding up. The same potentially conservative climate models project that the whiplash will more than double if global temperatures rise 3 degrees Celsius above pre-industrial levels. The world is already poised to blast past the Paris Agreement's targeted limit of 1.5 C. The researchers synthesized hundreds of previous scientific papers for the review, layering their own analysis on top.

Anthropogenic climate change is the culprit behind the accelerating whiplash, and a key driver is the "expanding atmospheric sponge" - the growing ability of the atmosphere to evaporate, absorb and release 7% more water for every degree Celsius the planet warms.

(Daniel L. Swain *et al*, [∞][Hydroclimate volatility on a warming Earth](#), *Nature Reviews Earth & Environment*, 09 January 2025

[∞][Floods, droughts, then fires: Hydroclimate whiplash is speeding up globally](#), *EurekAlert*, 09 January 2025)

As Wenxia Zhang *et al* summarize:

This past year, 2024, is on track to be the warmest year, joining 2023 as the two hottest years on record. With the exceptional heat, weather and climate extremes were common across the world. In particular, 2024 has seen a remarkable run of extreme precipitation events and resulting impacts. Here, we provide an overview of the most notable extreme events of the year, including extreme precipitation and floods, tropical cyclones, and droughts.

(Wenxia Zhang *et al*, ^œ[A Year Marked by Extreme Precipitation and Floods: Weather and Climate Extremes in 2024](#), *Advances In Atmospheric Sciences*, 11 January 2025)

My own recent experience can attest to this: I am currently (early January 2025) completing repairs resulting from more than a week of wild weather in August 2024, culminating in a giant hail storm, concurrently suffering, nonetheless, a prolonged period of drought. My world is becoming increasingly harsh and unpredictable - and, as Swain *et al* suggest, my experience is becoming commonplace! We are going to be busy people if this keeps up!!

All that is needed is reshaping of current practices 🐼

Inconsiderately, Global Warming has not put itself on hold while US politicians play 'World Bully' and ^œ[nations on the receiving end of their shenanigans](#) react to protect themselves from the consequences of US belligerence. We are being [manipulated](#) by [sociopathic opportunists](#), intent on myopically pursuing absurd political advantage as though nothing else was happening to this sad world of ours!

So far, in the US⁷³⁸, and, indeed, in much of the rest of the Western World, measures to address the underlying causes of looming catastrophe have assumed that all that is needed is reshaping of current practices. The strangely muted ^œ[Green New Deal](#) which has been proposed (but not implemented) in the US illustrates an apparent belief that tinkering with the current system is all that is required to avert disaster.

Yves Smith has explained

As we've stressed repeatedly, the Green New Deal proponents will not acknowledge, let alone promote, far and away the most important and urgent measures we can take to combat climate change: radical conservation.

They aren't even pushing for some of the measures implemented during the [1970s] Oil Crisis to discourage fossil fuel use, like setting summer thermometers at 77 degrees to reduce air conditioning use, every other day access to gas stations, and encouraging commuter ride-sharing.

These may seem merely symbolic to the level of the challenge, but they send a strong psychological message of needing to change our daily habits to reduce greenhouse gas use. And perhaps most important, if citizens en masse are encouraged or required to curtail their activities, it will become politically difficult for those higher up the food chain, both large companies and wealthy individuals, to continue to be carbon profligates.

(Yves Smith, ^œ[Lessons from the First New Deal for the Next One](#), *NakedCapitalism*, April 14, 2021)

In the face of rapidly deteriorating conditions around the world, optimism is looking increasingly like self-delusion:

Next year is going to be a huge one for international climate negotiations. Because the 2020 climate summit was canceled, there are big expectations for the next meeting in Glasgow, Scotland, in November 2021. When the Paris Agreement was signed in 2015, nearly every country in the world committed to the goal of working together to limit global warming to well below 2 degrees Celsius....

In a reversal of President Trump's policies, President-elect Biden plans to re-enter the Paris climate accord and consider climate change part of the leadership of every cabinet position...

(Mark Shimabukuro, [What's on the Horizon for the Climate Desk?](#), *New York Times*, December 30, 2020) (Their emphasis)

Stewart Patrick explained the likely outcome of all this:

Unfortunately, rejoining the accord itself will do little to change the current climate trajectory. To meet the 1.5 degree Celsius target, parties must cut global emissions 7.2 percent each year through 2030, reducing them 45 percent from 2010 levels.

That is not going to happen. Emissions may fall by 8 percent this year because of the pandemic shutdowns - the biggest annual decline since World War II. But history suggests they will rebound sharply. Given the accumulated stock of greenhouse gases in the atmosphere, 2020's brief downward blip will not slow the momentum of global warming. (Stewart M. Patrick, [Rejoining the Paris Agreement Is the Easy Part for Biden on Climate Change](#), *World Politics Review*, November 9, 2020)

□

As 2021 unfolded, what practical measures has a new, corporatist, neoliberal US administration not merely 'proclaimed' but **taken** to reinstate the minimal environmental protections which had been established prior to the 2017-2021 Trump presidency?

Bernie Sanders, as reported by Maureen Dowd, summed up the 2021 US reality (echoed to varying extent in most Western 'democracies'):

"Maureen, let me just tell you what we're trying to do here," he says. "We're working on what I think is the most consequential piece of legislation for working families since the 1930s..."

"Does anyone deny that our child care system, for example, is a disaster? Does anyone deny that pre-K, similarly, is totally inadequate? Does anyone deny that there's something absurd that our young people can't afford to go to college or are leaving school deeply in debt? Does anybody deny that our physical infrastructure is collapsing? Does anybody except anti-science people deny that climate change is real? Does anyone deny that we have a major health care crisis? Does anyone deny that we pay the highest prices in the world for prescription drugs? Does anyone deny we have a housing crisis? Does anyone deny that half the people live paycheck to paycheck?"

Sanders, who has talked about spending up to \$6 trillion on the reconciliation package, says he will not support a two- or three-trillion-dollar bill. "That's much too low."

(Maureen Dowd, ^œ[The Ascension of Bernie Sanders](#), *New York Times*, 10 July, 2021)

But, of course, as Sanders is well aware, he is 'cooperating' with a President who has, at least since 1973, been a 'right-of-center' Washington politician. One can but wish Sanders well in his Sisyphean bid to ensure that President Biden not only promises but actually delivers 'fundamental reform'.

Those US voters who recognize the enormity of the task before him, should do everything in their power to support him in his determination. It might well be the US' last, best hope of rebuilding a government 'by the people, for the people'.

Patrick summed up the Biden instigated Earth Day summit:

The summit... leaves important, lingering questions, the most important of these being the feasibility and credibility of Biden's plans. His topline commitment is to reduce U.S. greenhouse gas emissions by 50 to 52 percent from their 2005 levels by 2030. This new target is nearly double what then-President Barack Obama offered as the U.S. contribution to the Paris Agreement in 2015. The good news is that U.S. emissions have been declining. They were down 13 percent from the 2005 levels in 2019 and are estimated to have declined 21 percent from that baseline last year, thanks to the pandemic-induced recession. The bad news is that emissions are now rising as the U.S. economy recovers.

(Stewart M. Patrick, ^œ[Biden's Ambitious Climate Pledge Puts U.S. Credibility on the Line](#), *World Politics Review*, April 26, 2021)

Coral Davenport explained the probable 2021 achievements of the new administration in 'rolling back' the deregulatory 'achievements' of the Trump era:

President Biden, vowing to restore environmental protections frayed over the past four years, has ordered the review of more than 100 rules and regulations on air, water, public lands, endangered species and climate change that were weakened or rolled back by his predecessor.

But legal experts warn that it could take two to three years - and in some cases, most of Mr. Biden's term - to put many of the old rules back in place.

"People should temper their expectations about what can be done quickly," said Kevin Minoli, who served as a lawyer at the Environmental Protection Agency in the Clinton, Bush, Obama and Trump administrations.

(Coral Davenport, ^œ[Restoring Environmental Rules Rolled Back by Trump Could Take Years](#), *New York Times*, January 22, 2021)

As Davenport outlines, there is a wide range of 'reasons' which can be used to justify 'rollback inertia'!

Here is what that looks like:

On his first day as president, Mr. Biden won praise from climate resilience experts by signing an executive order that, according to the White House, reinstated an Obama-era rule on flood risk.

The rule imposed higher standards on federally funded construction in flood zones. It was rescinded by Mr. Trump after the home building industry said it would increase costs.

Climate experts hailed Mr. Biden's move as a crucial step to ensure that new homes, roads and other investments would be safe from rising seas, stronger hurricanes and more intense storms. In particular, restoring the flood rule would help ensure that projects funded through the president's \$2 trillion infrastructure package would be better protected.

But the administration reversed itself last month, saying that Mr. Biden's order did not in fact reinstate the flood rule. No reason was given. Mr. Patel did not respond to questions about the rule.

Rob Moore, a senior policy analyst at the Natural Resources Defense Council, said the administration needed to put the flood rule in place. "Otherwise, they run the risk of a lot of money going out the door to build things that fall in the water," he said.

(Christopher Flavelle, ["Biden Promises to 'Build Back Better.' Some Climate Experts See Trouble, New York Times, May 6, 2021"](#))

Let's not feign surprise! It was always more likely that Biden would find an exit enabling him to 'modify' his proposals (after all that's what happened when he was the vice president under Obama). Davenport *et al* explained:

On Wednesday, White House officials said they had not wavered in their commitment to making climate a core part of any infrastructure package. The administration has encouraged a bipartisan group of senators to continue to try to hammer out an agreement.

"The president has underscored that climate change is one of the defining crises we face as a nation, and in the negotiations he has continuously fought for leading on the clean energy economy and on clean energy jobs - which is critical for our economic growth, competitiveness, and middle class," said Andrew J. Bates, a White House spokesman, in a statement.

Several Democratic senators as well as many climate activists say they nonetheless fear that the prospects for climate legislation could evaporate, as they did in the first term of the Obama administration. (Coral Davenport, Lisa Friedman and Emily Cochrane, ["Collapse of Infrastructure Talks Puts Climate Action at Risk, New York Times, June 9, 2021"](#))

The process continued through the rest of June, 2021. First there *was* an agreement; then there *wasn't* an agreement; then there 'almost certainly' *was* one again... ⁷³⁹

Successful US politicians have developed a remarkable deftness in ensuring that their voter-oriented 'visionary' policies are 'justifiably' modified - often into oblivion!

Lambert Strether described the 2021 US political inertia problem well:

Coverage of the infrastructure bill seems to have stalled (along with the bill itself;...). The same goes for a lot of other Biden administration initiatives, like WTO patent waivers for vaccines, withdrawal from Yemen; basically everything except the Covid relief bill, which the entire political class agreed had to be passed (just like the CARES Act).
...

[I]t seems that whenever Biden announces something will get done, the press moves on to something else, confident that *something*, at least, will get done.

Perhaps they're all at brunch now. Or perhaps newsrooms are even leaner than before, now that the clicks from Trump's constant churn aren't boosting revenues. Or perhaps the press just won't criticize someone they see as representing them, as a class.

Whatever the reason, if one after-effect of Covid is *brain fog*, one effect of the Biden administration is *Biden Fog*; it's extremely difficult to see what, if anything, the administration is actually *doing*. Biden Fog makes me very uneasy, more uneasy than the Obama administration's smooth manipulateness.

(Lambert Strether of Corrente, ^œ[Water Cooler: Politics, Naked Capitalism](#), May 10, 2021)

Producing and consuming our way into our species' grave 🐦

Greenhouse gasses are but one of the problems facing humanity in future years.

We are myopically 'producing' and 'consuming' our way into our species' grave - because 'profit'; because 'greed'; because 'we need to shop - it makes us feel good about ourselves'. Rusty Guinn explained:

The problem, of course, is that consumption really does make us happier, at least for a while. Then, inevitably, we do what humans do best. We adapt. To trigger the same chemical and emotional response, our brain tells us we need new consumption. Something bigger and more exciting.

The hedonic treadmill is real...

(Rusty Guinn, ^œ[The ZIRP Paradox](#), *Epsilon Theory*, December 14, 2020)

Rachit Dubey *et al*, in a 2022 article entitled 'The pursuit of happiness: A reinforcement learning perspective on habituation and comparisons', have explained the problem for peoples trapped in an individualized competitive determination to materially demonstrate 'self-worth'⁷⁴⁰.

Mami Mizutori and Debarati Guha-Sapir (in a foreword to the report below) explained the consequences:

We are twenty years into this new century, and disaster risk is taking on new shapes and sizes with every passing year.

Disasters have never waited their turn, and increasingly risk is interconnected. Risk drivers and consequences are multiplying and cascading, colliding in unanticipated ways. We must have a commensurate systemic response with national and local strategies for disaster risk reduction fit for purpose. Political commitment, strategies and scenario planning have never been more important for disaster risk management....

It is baffling that we willingly and knowingly continue to sow the seeds of our own destruction, despite the science and evidence that we are turning our only home into an uninhabitable hell for millions of people.⁷⁴¹

What is happening around the world? 🐦

The Arctic is among the fastest warming regions in the world and is heating at twice the global average. Annual surface air temperatures over the last 4 years (2016-2019) in the Arctic (60°-85°N) have been

the highest on record. The volume of Arctic sea-ice in the month of September 2019 (after the melting season) has declined by more than 50% compared to the mean value for 1979-2019.

Siberia has witnessed exceptional heat, with temperatures up to 10°C (18.5 °F) above average in May and driving the warmest May on record for the entire Northern hemisphere and indeed the globe.

But it wasn't just May that was unusually mild in this region; the whole of winter and spring had repeated periods of higher-than-average surface air temperatures, particularly from January onwards.

The unusual warmth in winter and spring was associated with an exceptionally early break-up of ice in Siberia's rivers.

(^œ[Reported new record temperature of 38°C north of Arctic Circle](#), *World Meteorological Organization*, 23 June, 2020)

With that warming comes thawing and drying of the tundra and its associated subsurface peat. Jannik Martens *et al*, in a research article entitled ^œ[Remobilization of dormant carbon from Siberian-Arctic permafrost during three past warming events](#) (*Science Advances* Vol. 6, no. 42, 16 Oct 2020) have made a sobering prediction based on their research:

Arctic warming by only a few degrees may suffice to abruptly activate large-scale permafrost thawing, indicating a sensitive trigger for a threshold-like permafrost climate change feedback.

Rashit Hantemirov *et al* have summed up the Arctic region's trajectory over the first two decades of the 21st century:

The 2011-2020 mean temperature of the Arctic region (>60° latitude) alone was 0.71 °C higher than the preceding decade mean. Adverse consequences of this rapid warming are already underway: enhanced ice loss across Greenland, record-low Arctic sea ice extent, permafrost thawing and unprecedented wildfires across Siberia, with considerable implications on a suite of human and natural systems, both within and outside the polar regions. Yet, despite the relevance of temperature for the Arctic system, instrumental records are often short or incomplete in polar regions and precisely-dated temperature proxies with high temporal resolution are largely lacking.

Siberia is among the regions with the strongest warming worldwide (Fig. 1a) and heatwaves have reached a disturbing new level in recent years, especially in 2020 when temperatures soared across Siberia to reach a record-breaking 38 °C inside the Arctic Circle.

This massive build-up of heat in the Arctic promotes the rapid disappearance of sea ice, accelerates thawing of carbon-rich permafrost and the emergence of extreme wildfires. A hotter climate in Siberia arguably has devastating, cascading effects on local ecosystems, human communities, and the built environment. It will also impact the global climate system as a whole, for example through the enhanced release of greenhouse gases from permafrost bodies, the largest peatland surface on Earth, and wildfires, reduced snow cover and melting ice, or even changes in the physical processes of the Arctic Ocean.

(Rashit M. Hantemirov *et al*, ^œ[Current Siberian heating is unprecedented during the past seven millennia](#), *Nature Communications*, Vol. 13, Article number: 4968, 25 August 2022)

As the tundra and its associated subsurface peat dry they become susceptible to burning. Shelly Sommer has described what is happening:

"Zombie fires" and burning of fire-resistant vegetation are new features driving Arctic fires - with strong consequences for the global climate - warn international fire scientists in a ^œ[commentary published today in *Nature Geoscience*](#).

The 2020 Arctic wildfire season began two months early and was unprecedented in scope.

"It's not just the amount of burned area that is alarming," said Dr. Merritt Turetsky, a coauthor of the study who is a fire and permafrost ecologist at INSTAAR. "There are other trends we noticed in the satellite data that tell us how the Arctic fire regime is changing and what this spells for our climate future."⁷⁴²

A *Nature Geoscience* editorial has explained the consequences of permafrost warming:

Permafrost warming changes the soil environment, which activates the microbial decomposition of organic matter. Microbial activity is largely suppressed when the temperature is below freezing. However, as the ambient climate warms, frozen soil thaws and microorganisms speed up the decomposition of organic matter into carbon dioxide (CO₂), methane (CH₄) and nitrous oxide (N₂O). The process can be further accelerated as the microbial community composition changes.

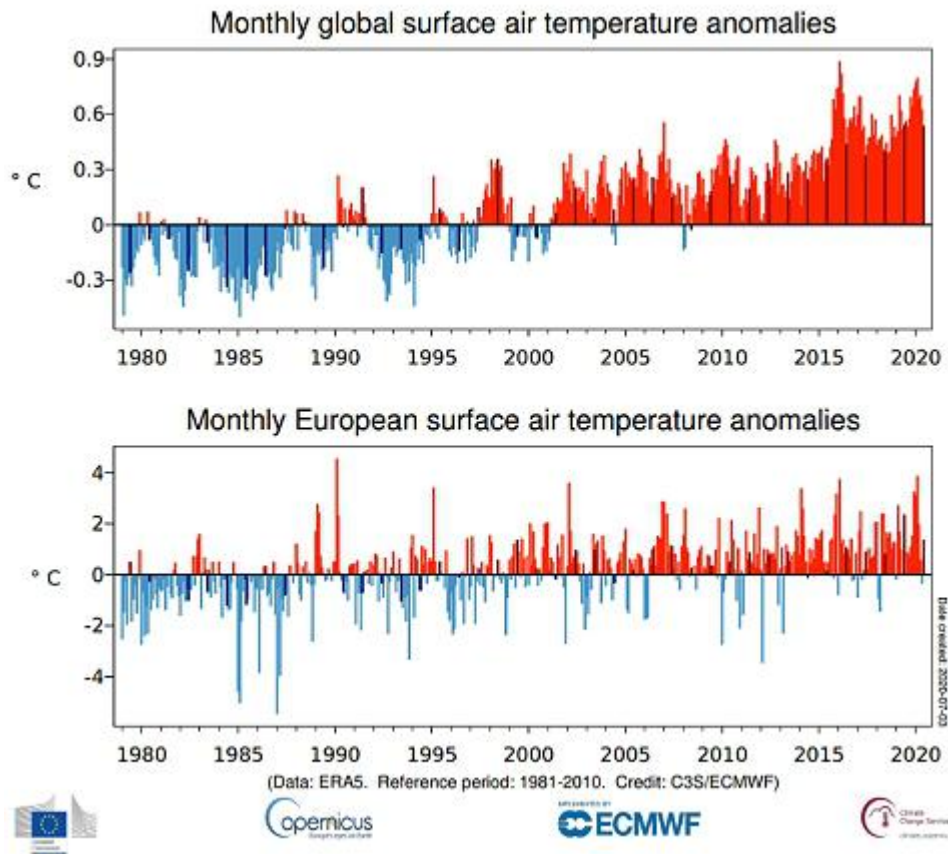

Permafrost soil is lacking biogeochemical processes due to the reduced diversity of the microbial community via environment filtering over millennia-long freezing. These missing processes, however, can be recovered as the community diversity increases in the warmed soil. An Article in this issue [Sylvain Monteux *et al*, ^œ[Carbon and nitrogen cycling in Yedoma permafrost controlled by microbial functional limitations](#)] shows that easing limitations of biogeochemical functions in permafrost soil makes soil carbon even more vulnerable to decomposition, which increases microbial CO₂ production by 38%.

Direct GHG emissions may only account for part of the carbon loss from thawing sites. Much of the carbon is actually taken away by meltwater. Direct measurements of soil carbon change in an experimentally warmed permafrost site in Alaska show that lateral hydrological export of carbon is responsible for more than 50% of carbon loss during permafrost degradation³. Failure to consider the lateral transport of carbon may substantially underestimate the impact of permafrost thaw on climate change.

(Editorial, ^œ[When permafrost thaws](#), *Nature Geoscience*, 30 November 2020)

The *Copernicus Climate Change Service* (C3S) has provided a graphic description of monthly global-mean and European-mean surface air temperature anomalies relative to 1981-2010⁷⁴³, from January 1979 to June 2020. As they explain:

Outside Europe, temperatures deviated most from June 1981-2010 average in a band covering almost all of the Siberian Arctic land mass, where they were the warmest on record for June, both on average over the region and in terms of extremes.:

Monthly global-mean and European-mean surface air temperature anomalies relative to 1981-2010, from January 1979 to June 2020.

The darker coloured bars denote the June values.

Peng Zhang *et al* have provided a bleak assessment of environmental developments in inner East Asia 'that reveals an abrupt shift to hotter and drier conditions'. As they summarize:

Unprecedented heatwave-drought concurrences in the past two decades have been reported over inner East Asia. Tree-ring-based reconstructions of heatwaves and soil moisture for the past 260 years reveal an abrupt shift to hotter and drier climate over this region.

Enhanced land-atmosphere coupling, associated with persistent soil moisture deficit, appears to intensify surface warming and anticyclonic circulation anomalies, fueling heatwaves that exacerbate soil drying.

Our analysis demonstrates that the magnitude of the warm and dry anomalies compounding in the recent two decades is unprecedented over the quarter of a millennium, and this trend clearly exceeds the natural variability range. The "hockey stick"-like change warns that the warming and drying concurrence is potentially irreversible beyond a tipping point in the East Asian climate system.

Fig. 2 Tree-ring width-based reconstructions.

(A and B) Tree-ring width-based reconstructions of July-August mean extremely hot day frequency (A) and soil moisture anomaly (B) in 1750-2002 in inner East Asia (solid black curves) and their uncertainty (gray bars, defined as 2s of reconstruction ensembles). The red and blue curves in (A) are the extremely hot day frequency variability derived from ERA interim and station datasets. The red, cyan, blue, and pink curves in (B) are the soil moisture anomaly...

(Peng Zhang *et al*, [∞][Abrupt shift to hotter and drier climate over inner East Asia beyond the tipping point](#), *Science*, Vol. 370, Issue 6520, pp. 1095-1099, 27 Nov 2020)

For life, this planet may be as good as it gets 🦋

📅 (11/02/25)

For life, [∞][this planet may be as good as it gets](#). As Laurette Piani has explained,

The Earth is the only planet known to have liquid water on its surface, a fundamental characteristic when it comes to explaining the emergence of life...

(Laurette Piani, [∞][Earth may always have been wet](#), *French National Centre for Scientific Research*, August 27, 2020;

The research report: Laurette Piani, *et al*, [∞][Earth's water may have been inherited from material similar to enstatite chondrite meteorites](#), *Science*, Vol. 369, Issue 6507, pp. 1110-1113, August 28, 2020)

We are living on a planet which [∞][seems almost uniquely tailored to support life](#) and here is what we, Western Capitalists, are doing to it:

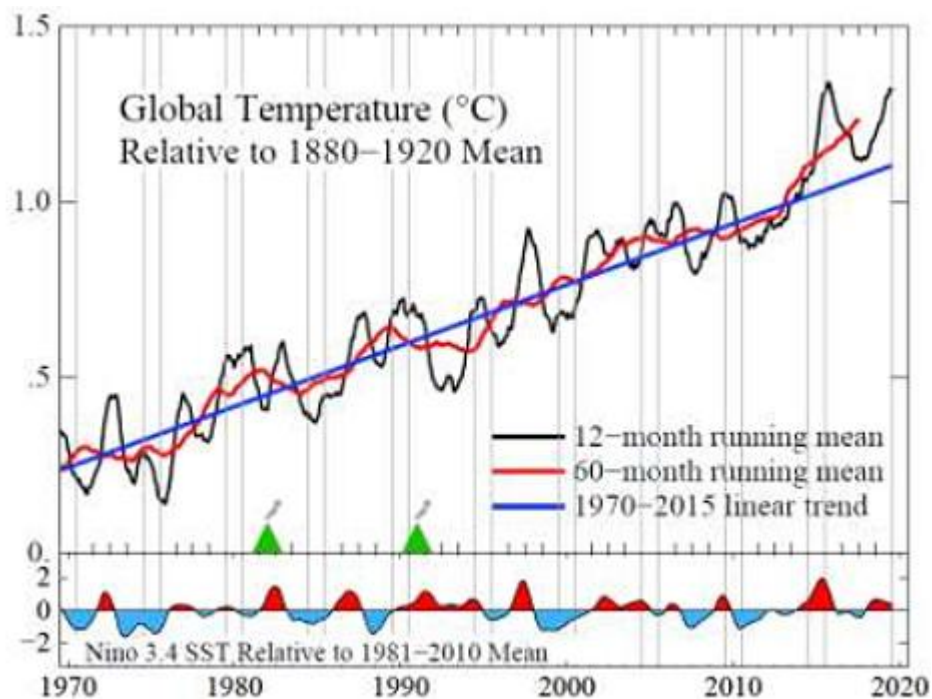

James Hansen has explained and illustrated the rapidly accelerating trend in global temperatures through the 2nd decade of the 21st Century:

July 2020 was the second warmest July since adequate global data began in 1880, second to July 2019. Global temperature was 0.89°C relative to the 1951-1980 base period and 1.12°C relative to 1880-1920.

The first seven months in 2020 was the second warmest January-July at 1.08°C (1.36°C relative to 1880-1920), but 2016 was just barely warmer at 1.09°C relative to 1951-1980.

The important matter, however, is not the interesting horse race between 2020 and 2016, but rather the apparent acceleration of global warming during the past several years, as shown by the figure below. The 12-month running has reached its relative maximum and will decline during the next several months as the budding La Niña in the Tropical Pacific will cause global temperature in coming months to fall generally below the temperature in the corresponding months in 2019....

However, global temperature is clearly running well above the linear trend that existed for decades. In an upcoming communication we will discuss the relation of the warming rate to changing climate forcings.

Green triangles denote El Chichón and Pinatubo volcanic eruptions. Niño 3.4 is the tropical Pacific region 5°N-5°S, 170-120°W

(James Hansen, ^œ[July 2020 Global Temperature Update](#), *Monthly Temperature Updates*, August 2020)

And, four and a half years later, global warming has accelerated. James Hansen *et al* have described what has happened since August 2020 in a research paper entitled ^œ[Global Warming Has Accelerated: Are the United Nations and the Public Well-Informed?](#) (03 February 2025). As they explain:

...Global warming has accelerated since 2010 by more than 50% over the 1970-2010 warming rate of 0.18 °C per decade... (Figure 1).... Earth is now warmer than at any time in the Holocene, the past 11,700 years of relatively stable climate in which civilization developed, and it is at least as warm as during the extreme warm Eemian interglacial period 120,000 years ago.

Global temperature increased 0.4 °C during the recent moderate El Niño (a period when east-to-west equatorial trade winds weaken,

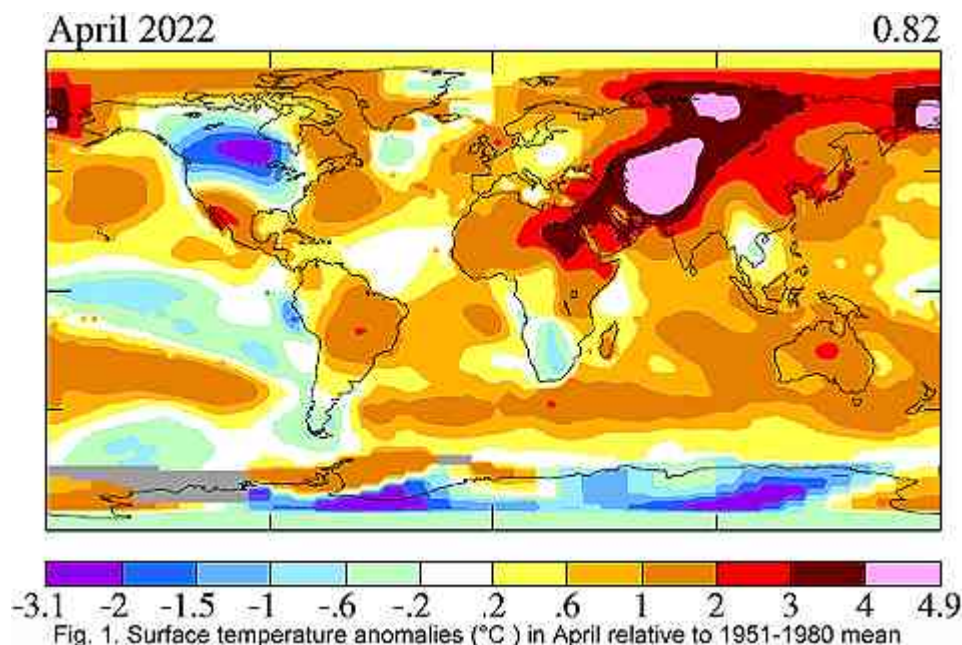

allowing warm waters of the West Pacific to move toward South America), a warming much greater than during even the strongest prior El Niños.

This rapid warming has baffled leading Earth scientists, who, for example, conclude that no combination of known mechanisms for warming "has been able to reconcile our theories with what has happened...

We conclude, on the contrary, that the known drives for climate change, principally human-made greenhouse gases and aerosols, account for observed global temperature, including a jump in sea surface temperature that amplified warming during the El Niño and has caused the widely discussed 1.5 °C temperature threshold to be breached, for all practical purposes.

The anomalous acceleration in global temperature, 'running well above the linear trend that existed for decades', suggests the possibility of an emerging feedback mechanism accelerating global warming. As Hansen explained in April 2022:

...Hotspots are getting hotter. The major hotspot in April stretched from Iraq to India and Pakistan, and toward the northeast through Russia (Fig. 1). Temperature exceeded 45°C (113°F) in late April in at least nine Indian cities,¹ on its way to 50°C (122°F) in Pakistan in May,² where a laborer says "It's like fire burning all around" and a meteorologist describing growing heatwaves since 2015 says "The intensity is increasing, and the duration is increasing, and the frequency is increasing." Halfway around the world, Canada and north-central United States were cooler than their long-term average, but people in British Columbia and northwest United States remember being under their own record-breaking hotspot last summer....

(James Hansen, Makiko Sato and Reto Ruedy, ^œHotter Hotspots, Drier Dryspots, Wetter Wetspots, and Stronger Storms, April 2022 Temperature Update, 16 May 2022)

Hostage to the stupidity of 'leaders' and 'power brokers' 🦋

Thomas Neuburger summed up the depths of the 2022 Western concern and determination to 'fix' the problem: ^œBiden Expands Oil Exploration in

[Bid to Slow Climate Change: Killing the climate to save it](#) (July 13, 2022).

Jake Johnson has provided a depressing account of the internal machinations of the US Democratic Party in an essay entitled ['Nothing Short of a Death Sentence': Fury as Manchin Tanks Climate Spending](#) (*Common Dreams*, July 15, 2022) and subtitled

Our democracy is broken when one man who profits from the fossil fuel industry can defy the 81 million Americans who voted for Democrats to stop the climate crisis

The peoples of the world have become hostage to the stupidity of its 'leaders' and 'power brokers'. 'Leaders' legitimized by claims of having been '[democratically](#)' elected and so 'speaking and acting on behalf of 'the people'".

When elected officials and their lackeys are [controlled, not by 'the people' but by self-serving oligarchs](#) with no other agenda than self-enrichment and aggrandizement, then we see what we see in 2022: millions of disenfranchised, displaced and destitute people and billions of powerless victims.

We have surrendered the future to a [cabal of sociopaths](#) and become powerless to change this sad reality. In 2022, the planet is heating and nuclear-armed nations are threatening war and 'we' the billions of disenfranchised people believe ourselves powerless. We really are a strange species!!

[Net Zero by 2050 is insanity: We're heading into a frightening future](#)

The world has stepped onto a heat escalator! Anyone who has tried walking back down an 'up' escalator knows how difficult it is to stop moving upward, let alone getting back down again! The extreme heat of 2022 has not merely set new temperature records, it has set the bar above which future extreme heat events will rise:

The World Health Organization's European office has said the heatwave baking Europe has caused over 1,700 deaths in Spain and Portugal alone, calling for joint action to tackle climate change.

"Heat kills. Over the past decades, hundreds of thousands of people have died as a result of extreme heat during extended heatwaves, often with simultaneous wildfires," WHO regional director for Europe Hans Kluge said in a statement.

"This year, we have already witnessed more than 1,700 needless deaths in the present heatwave in Spain and Portugal alone," Mr Kluge added.

The regional director stressed that exposure to extreme heat "often exacerbates pre-existing health conditions" and noted that "individuals at either end of life's spectrum - infants and children, and older people - are at particular risk".

Responding to a query by AFP, WHO Europe explained that the figure is a preliminary estimate based on reports by national authorities, and that the toll had "already increased and will increase further over the coming days".

([WHO says heatwave caused 1,700 deaths in Spain, Portugal](#), *RTE*, 22 July, 2022)

At 47°C lawns crackle underfoot and the sound and oppressive heat make the walker aware that the slightest spark could trigger an inferno. Best to stay indoors and pray!

And we're heading to higher temperatures than that over coming years and decades. There is no option! The time has come for truly drastic action and there can be no delay - we're heading into a frightening future.

Net Zero by 2050 or 2060 is insanity. Radical conservation, immediate reductions in all forms of planetary pollution and cessation of all forms of profit-driven production and consumption are minimum requirements if we are to limit the devastating consequences of near-term planetary heating.

This is realism - not fantasy. With *La Niña* conditions set to persist into 2023 the northern hemisphere will need to brace for headlines like this:

[∞][Astounding heat obliterates all-time records....](#)

Chunzai Wang *et al* have described the 'Unprecedented Heatwave in Western North America during Late June of 2021':

An extraordinary and unprecedented heatwave swept across western North America (i.e., the Pacific Northwest) in late June of 2021, resulting in hundreds of deaths, a massive die-off of sea creatures off the coast, and horrific wildfires. Here, we use observational data to find the atmospheric circulation variabilities of the North Pacific and Arctic-Pacific-Canada patterns that co-occurred with the development and mature phases of the heatwave, as well as the North America pattern, which coincided with the decaying and eastward movement of the heatwave. Climate models from the Coupled Model Intercomparison Project (Phase 6) are not designed to simulate a particular heatwave event like this one. Still, models show that greenhouse gases are the main reason for the long-term increase of average daily maximum temperature in western North America in the past and future....

Western North America (i.e., the Pacific Northwest of the United States and Canada), known for its temperate weather in June, normally has average high temperatures in the comfortable 18°C to 24°C range. However, western North America experienced an extreme heatwave in late June and early July of 2021, resulting in record temperatures in many places. In particular, Lytton, British Columbia broke Canada's all-time record on 30 June when the temperature topped 49.5°C. This heatwave is also responsible for hundreds of deaths, a massive die-off of sea creatures off the coast, and a spate of horrific wildfires Investigating and understanding the causes of this heatwave are both scientifically and socially important.

(Chunzai Wang *et al*, [∞][Unprecedented Heatwave in Western North America during Late June of 2021: Roles of Atmospheric Circulation and Global Warming](#), *Advances in Atmospheric Sciences*, 22 July 2022)

The likelihood of escalating disaster has been flagged by Constantin Arnscheidt and Daniel Rothman in a study entitled 'Asymmetry of extreme Cenozoic climate-carbon cycle events'. As they explain,

The history of Earth's climate and carbon cycle is preserved in deep-sea foraminiferal carbon and oxygen isotope records. Here, we show that the sub-million-year fluctuations in both records have exhibited negatively skewed non-Gaussian tails throughout much of the Cenozoic era (66 Ma to present), suggesting an intrinsic asymmetry that favors

"hyperthermal-like" extreme events of abrupt global warming and oxidation of organic carbon.

We show that this asymmetry is quantitatively consistent with a general mechanism of self-amplification that can be modeled using stochastic multiplicative noise. A numerical climate-carbon cycle model in which the amplitude of random biogeochemical fluctuations increases at higher temperatures reproduces the data well and can further explain the apparent pacing of past extreme warming events by changes in orbital parameters.

Our results also suggest that, as anthropogenic warming continues, Earth's climate may become more susceptible to extreme warming events on time scales of tens of thousands of years.

(Constantin W. Arnscheidt and Daniel H. Rothman, ^œ[Asymmetry of extreme Cenozoic climate-carbon cycle events](#), *Science Advances*, Vol. 7, no. 33, 11 Aug 2021)

The 21st century mantra is "More...More...More!".
Welcome to a pseudo-social interactional world 🌐

 (20/02/23) (24/01/25) (04/02/25)

There is a simple truth which western capitalists have, for too long, denied! Without controls ensuring the distribution and redistribution of credit through society, wealth (and so power), in capitalist societies, tends, over time, to concentrate in fewer and fewer hands.

It has been the failure of nations to [adequately educate their citizens](#) that has led to successful plutocratic challenges to progressive taxation and other redistributive regimes as 'unfair' and penalizing the 'wealth creators' of capitalism. Of course, those 'wealth creators' are actually capitalism's arch credit/ power accumulators and hoarders⁷⁴⁴.

With an [absurd growth in mega-wealth](#) through the neoliberally driven last half-century and more, those wealth accumulators have found themselves able to circumvent governments and focus on their enduring passion for 'profit' at the expense of all else.

Their 21st century mantra has become "More...More...More!".

More accumulated wealth; More [deregulation and 'freedom' to exploit resources and peoples](#) for private gain; More hyper-globalization to extend that exploitation to the furthest corners of the earth⁷⁴⁵; More subversion of governmental safe-guards; More control of politicians and their agents; More unravelling of communities and isolation of individuals, tethering them to 'social media', pseudo-social interaction and so to external control⁷⁴⁶.

But, most of all, More Profit!

Fatima Bhutto has summed up the problem for less industrialized nations⁷⁴⁷:

This is a climate war between the large industrial superpowers, financial predators that have polluted and poisoned our planet for profit, and the poor, who have done the least damage but will pay all of the consequences. Pakistan is responsible for less than 1 percent of global greenhouse gas emissions, but its people will bear the burden of the world's deadliest polluters. If nothing is done to mitigate global greenhouse gas emissions, according to the World Bank, 800 million

people in South Asia will be at risk of amplified poverty, homelessness and hunger.

The World Bank has identified Karachi as one the planet's climate hot spots. Temperatures across South Asia are estimated to rise by 3.9 degrees Fahrenheit [2.2°C] in the next 30 years. Karachi is already struggling with poor road connectivity, dire educational facilities and limited market access. Its already pathetic public health system will plummet. The rich might buy generators for electricity, pay for water tanks and rely on expensive hospitals, but the poor will continue to be devastated.

Pakistan's current government is speaking about climate change, but it is a conversation that has come too late, unaccompanied by serious action. In 1947, Pakistan was 33 percent forest. Today, we have tree cover of just about 4 percent, all because of deforestation. This destruction, largely caused by the illegal logging by timber mafias, has silted up our waterways and left us undefended against floods and storms....

(Fatima Bhutto, [Pakistan's Most Terrifying Adversary Is Climate Change](#), *New York Times*, September 27, 2020)

There have, in recent years, been many who have argued that as 'big business' begins to realize that it exists within a finite natural world and relies upon the health of that world in maximizing profit it will factor that realization into its calculations. It will begin to appreciate 'that environmental stewardship pays economic and other dividends....

'Citizens and policymakers will begin internalizing what ecologists have long told us: namely, that nature is not just something "nice to have." It is the foundation for our very existence. We rely on healthy ecosystems for innumerable services, from the oxygen we breathe, thanks to forests and phytoplankton, to the crops we eat, courtesy of bees and other pollinators'.

Stewart Patrick has explained how this change of heart will occur:

...[M]any governments and corporations are beginning to take note, finally acknowledging that "natural capital" is just as important for human prosperity and security as financial, physical and human capital. Rather than treating human impacts on the environment [as] market "externalities" that will somehow take care of themselves, policymakers and businesspeople are starting to include nature's provision of ecosystem services in their national accounting systems and corporate balance sheets. While some environmentalists may bridle at putting a price on nature, experience suggests that *capitalism only values what it can price*.

(Stewart M. Patrick, [California's Bold Conservation Push Is Part of a Hopeful Global Trend](#), *World Politics Review*, August 03, 2020 - my emphasis)

Capitalism only values what it can price. That is indeed the problem!

For those who see 'profit' as the driving motivation in investment and business decisions, 'natural capital' must, if it is to be 'taken into consideration', contribute to the 'bottom line'. Those who limit their drive for profit in the hope that their constraint will ensure long-term profitability will be out-competed by those who continue to limit their concerns to tangible, short-term contributors to realizable 'profits'.

Their myopic, unregulated drive to profit and power has already unleashed a tsunami of waste on the world⁷⁴⁸; a world fast becoming a vast refuse tip; a world of degraded environments and decaying infrastructures; of unraveled communities; [a world of despair](#).

And, as if that weren't enough, they see profit in preparing the destructive means for pitting nation against nation; community against community; individual against individual, to profit from chaos, from hopelessness, from fear. [Cry havoc and unleash the dogs of war!](#)⁷⁴⁹

Despite their protestations and claims that their greed benefits all; that they are, indeed, the world's 'super-[philanthropists](#)', they are the prime architects of the looming disasters which we have already documented elsewhere and those which we will examine here.⁷⁵⁰

Nothing motivates Western Capitalists more effectively than a belief that involvement will lead to profit⁷⁵¹! James Baker, George Shultz, and Ted Halstead, all of them *laissez faire* capitalists, have put the case for United States 'leadership' in international action on climate change:

In the United States, the case for greater action on climate change is typically made on environmental grounds. But there are equally compelling economic, geopolitical, and national security rationales for the United States to lead the world on climate policy. Even those who remain skeptical of the environmental urgency of the problem should recognize the overwhelming strategic advantages of U.S. climate action at home and abroad.

Those who oppose greater U.S. engagement and ambition have legitimate concerns. These concerns tend to fall into two buckets. The first is economic: the chief worry is that global climate solutions could put the U.S. economy at a competitive disadvantage with its trading partners and reduce American living standards. The second set is geopolitical: some observers wonder why the United States should reduce its own greenhouse gas emissions if other countries won't do their part.

But a well-designed U.S. climate policy can replace national vulnerabilities with major strategic opportunities. We propose here an environmentally ambitious, economically sound, and politically feasible plan that situates the United States at the forefront of a clean energy future, enhances the competitiveness of U.S. firms, and allows all Americans to benefit directly from emission reductions. Such a plan would also speed up and strengthen the United States' economic recovery once the immediate health concerns from the novel coronavirus outbreak subside.

(James A. Baker III, George P. Shultz, and Ted Halstead, ^œ[The Strategic Case for U.S. Climate Leadership: How Americans Can Win With a Pro-Market Solution](#), *Foreign Affairs*, Volume 99, Number 3, Pp. 28-38, May/June 2020)

That's what we need: 'Pro-Market Solutions'! If capitalists can profit from cleaning up the messes they create then, of course they will do so. They only need a plan (or two).

Jag Bhalla, in an essay published on the website ^œ[Undark](#), entitled '**It's Time We Stop Listening to Economists on Climate Change: Economic models of climate change are so riddled with flaws and fudge factors that we'd be better off without them**', explained the problem

(one which bedevils models built to justify 'pro-market solutions' to the looming catastrophe):

A TRICKY TRUTH of the climate crisis is that it calls for humanity to act today on what we believe will happen in the future, which requires us to put our faith in the predictions of mathematical models. A trickier truth - one that has helped sow seemingly endless political division and inertia - is that not all of those models are created equal.

Take, for instance, the work of 2021 Nobel laureates [for Physics] Syukuro Manabe and Klaus Hasselmann, whose models accurately predicted the global warming and climate change we've experienced in recent decades. Their work inspired sophisticated ocean-atmosphere models that can take months to process on the world's fastest supercomputers. Climate physics foresees an Earth undergoing essentially irreversible shifts, or tipping points, into a much-altered biosphere if global temperatures rise more than 2.7 degrees Fahrenheit (1.5 degrees Celsius) above preindustrial levels - a threshold we could reach within the next decade.

Contrast that grim forecast with the predictions of the Dynamic Integrated Climate-Economy model, for which Yale University's William Nordhaus won the 2018 Nobel prize in economics. DICE is simple enough that a version of it can run in Excel, and Nordhaus has suggested society's optimal climate trajectory - the one that best balances the economic harms of global warming with the costs of climate action - would correspond to a global temperature rise of 6.3 F (3.5 C) by 2100. (Note that DICE models can generate a range of results. One 2020 paper used the model to support the U.N.'s climate targets as the optimal trajectory. Here, let's focus on Nordhaus's influential prize-winning work.)

(Jag Bhalla, ^œ[It's Time We Stop Listening to Economists on Climate Change: Economic models of climate change are so riddled with flaws and fudge factors that we'd be better off without them](#), *Undark*, November 11, 2021)

COP26, the much ballyhooed 2021 Climate Summit at which 'World Leaders' would pledge to ensure that their nations achieved 'net-zero' carbon emissions between 30 and 50 years into the future, opened on the 1st of November. Most offered plausible plans for long-term carbon emissions reduction over the period they nominated as their 'target date'. Australia's prime minister, a long-declared 'Climate-Skeptic', provided his 'plan' for reaching a 2050 'net-zero-emissions' target:

Prime Minister Scott Morrison has pledged an extra half a billion dollars in support for Australia's Pacific and South-East Asian neighbours, grappling with the devastation wrought by climate change.

Mr Morrison made the announcement during his speech at the COP26 climate summit in Glasgow, formally committing Australia to a mid-century target of net zero carbon emissions.

But the Prime Minister was cautious to suggest the conference, which has been billed as one of the most important in a generation, could only achieve so much.

He argued the challenge of achieving any progress on cutting carbon emissions would be "met by those who are frankly largely not in this room".

"It will be our scientists, our technologists, our engineers, our entrepreneurs, our industrialists and our financiers that will actually chart the path to net zero - and it is up to us as leaders of governments to back them in," Mr Morrison said.

"Technology will have the answers to a decarbonised economy, particularly over time."

The federal Opposition accused Mr Morrison of embarrassing Australia on the world stage.

"It's just a continuation of the steaming pile of nothingness that we had in Australia before he left," Shadow Energy Minister Chris Bowen said.

"It is a speech devoid of substance, it's more slogans, more spin.

Just talking about technology and saying technology over and over is not a framework for the development and adaption, or the adoption, of that technology."

(Matthew Doran, [∞][Scott Morrison pledges funding to support neighbouring Pacific, Asian nations dealing with climate change at COP26](#), ABC News, 02 November, 2021)

Perhaps Morrison was among the more honest (and more naive) of those presenting speeches at the Summit. He would leave the task of reaching his declared 2050 'net zero' emissions target in the hands of 'our scientists, our technologists, our engineers, our entrepreneurs, our industrialists and our financiers' who will develop the necessary 'plans' and technologies as they are required. His Government had no 'plan' for reaching the goal - he would rely on the 'Private Sector' to produce the necessary technologies and plans.

'World Leaders' have settled for 'business-as-usual' 🐦

It seems, given the rhetoric and hyperbole of the COP26 Summit, that many of the 'World Leaders' have, implicitly, decided that 'business-as-usual' is what they will settle for. Private enterprise will have to do the necessary heavy lifting if the world is to be saved from 'doomsday'.

A favorite 'plan' for doing this, which has 'justified' and legitimized many of the 'global emissions targets' of nations around the world, has centered on 'carbon offsetting'. Anis Chowdhury and Jomo Kwame Sundaram summed up this self-deluding Western 'solution' to 'global warming'

Carbon offset markets allow the rich to emit as financial intermediaries profit. By fostering the fiction that others can be paid to cut greenhouse gases (GHGs) instead, it undermines efforts to do so.

Committing to achieve 'net-zero' carbon emissions has become a major climate change policy goal. But most climate scientists agree the target is dangerously misleading. Ostensibly promoting decarbonization, it actually allows carbon emissions to continue rising.

(Anis Chowdhury and Jomo Kwame Sundaram, [∞][Profiting from the Carbon Offset Distraction](#), *Challenging Development*, November 30, 2021)

A *Climate Home News* article by '41 Scientists' explained:

Carbon neutrality targets are often not as ambitious as they sound, relying on problematic carbon offsets and unproven technologies.

The idea of carbon offsetting, which underpins so-called net zero targets, is founded on a number of myths....

Assumptions of future technologies and targets decades ahead delay immediate action. Countries and corporations must shift focus from distant net zero targets to real emissions reductions now. (41 scientists, ^œ[10 myths about net zero targets and carbon offsetting, busted](#), *Climate Home News*, 11/12/2020)

However, in the minds of politicians and others intent on finding alternatives to real emissions reductions, in the third decade of the 21st century an oft-tried and failed 'alternative technology', carbon capture and storage (CCS)⁷⁵², is apparently 'one of the new technologies that scientists hope will play an important role in tackling the climate crisis'. So, the

UK government recently selected four sites to develop multi-billion-pound CCS projects as part of its scheme to cut 20-30m tonnes of CO₂ per year by 2030 from heavy industry. Other countries have made similar carbon reduction commitments....
(^œ[Safer carbon capture and storage](#), *University of Oxford Press* Release, December 22, 2021)

Robert Service came up with a few plans (some of which have been in circulation for much of my lifetime) in a 'scientific' article entitled 'The carbon vault: Industrial waste can combat climate change by turning carbon dioxide into stone'⁷⁵³

What wonderful, inspiring optimism. How wrong it would be to mock such enthusiasm, to pour cold-water on such visionary schemes. But, of course, such solutions belong in the 1950s not in the 2020s. And, in the 1950s capitalists laughed scornfully at such 'impractical', profitless activities. Now, the disasters are already with us. Jeffrey Brainard, in the same edition of the *Journal*, describes one of them:

Hurricane Laura's double punch

DISASTERS: When it roared ashore last week in Louisiana, Hurricane Laura packed a double whammy, endangering public safety with its wind and water and slowing efforts to stem the COVID-19 pandemic. Its top wind speed at landfall, 241 kilometers per hour, was the fifth highest documented for any U.S. hurricane. Laura tied a record for the fastest intensifying storm in the Gulf of Mexico, with its wind increasing on 26 August by 105 kilometers per hour in just 24 hours; the causes of such rapid strengthening are little understood. The storm led to at least 19 deaths in Louisiana and Texas. It also threatened to accelerate the spread of COVID-19; testing centers were temporarily closed, and residents of southwest Louisiana, which bore the storm's brunt and had been recording some of the state's highest rates of positive test results, evacuated elsewhere. Seven hurricanes and tropical storms have hit the United States so far this year, one of the most active seasons on record.

And, in the northern Pacific: ^œ[Super Typhoon Haishen expected to make historic landfall in South Korea: The country has not previously been hit by three typhoons in a single year, according to records dating back to 1945](#) (Jeff Masters, *Yale Climate Connections*, Friday, September 4, 2020)⁷⁵⁴

Cold fusion or LENR is coming: It won't be long now!! 🦋

More than fifty years ago a physicist whom I respect assured me that the world would have limitless supplies of 'clean energy' within the 'next five years'. Nuclear Fusion would be mastered within that time frame. The question was: 'Why would we get involved in 'greenhouse gas reductions' when the problem is a temporary one, soon to be resolved?'. It is still 'less than five years away'! Martin Greenwald, in a *Journal of Plasma Physics* Special Edition, explained:

This special issue provides a snapshot of the physics basis for SPARC, a compact, high-field, deuterium-tritium burning tokamak, currently under design by a team from the Massachusetts Institute of Technology and Commonwealth Fusion Systems. The project builds on a remarkable period of progress in the understanding of magnetically confined plasmas achieved collectively by the world's fusion programs. This progress puts us in a position to take advantage of a technological breakthrough developed outside of our field, namely the emergence of high-temperature superconductors (HTS) as a practical engineering material.

By enabling fusion magnets to operate at high magnetic field, the beneficial impact of HTS is clear - the step size of turbulent or collisional transport processes scales with the gyroradius and thus plasma performance improves as a strong function of the number of gyroradii across the plasma ($1/p^*$). Further, operational limits for plasma pressure, density and current all increase with magnetic field. For exactly these reasons, the design for the ITER experiment explicitly required the highest possible magnetic field achievable with the niobium-based technology available at the time. The use of a newer, higher field magnet technology enables similar levels of plasma performance in devices of considerably smaller size and thus lower capital cost....

(Martin Greenwald, [Status of the SPARC physics basis](#), *Journal of Plasma Physics*, Vol. 86, Issue 5, 29 September 2020)

Charles Choi heralded the future:

A viable nuclear fusion reactor - one that spits out more energy than it consumes - could be here as soon as 2025.

That's the takeaway of seven new studies, published Sept. 29 in the *Journal of Plasma Physics*.

If a fusion reactor reaches that milestone, it could pave the way for massive generation of clean energy.

(Charles Q. Choi, [Nuclear fusion reactor could be here as soon as 2025](#), *Live Science*, October 02, 2020)

Sabine Hossenfelder has produced a short video entitled '[Cold Fusion is Back \(there's just one problem\)](#)' (October 8, 2022) explaining the hopes and problems besetting 'cold fusion' research. As she says 'Cold Fusion is Back (but now they call it LENR [low energy nuclear reactions])'

The simple fact is that, no matter how plausible future technologies might appear, it is folly to gamble the future of humanity on them in the hope of their 'success'.

And, when some significant advance seems to be made, inevitably, as a *Global Times* report claims, its usefulness in developing nuclear weapons is top of the agenda:

A major US scientific breakthrough in nuclear fusion, the first time anyone has achieved the phenomenon known as fusion ignition, creating a nuclear reaction that generates more energy than it consumes, is believed by Chinese experts to aim at developing nuclear weapons, but its effectiveness and efficiency awaits improvement for practical use.

The US Department of Energy (DOE) announced on Tuesday that a team from the Lawrence Livermore National Laboratory (LLNL) conducted the first controlled fusion experiment in history at the laboratory's National Ignition Facility (NIF) on December 5, paving the way for advancements in national defense and the future of clean power.

(GT staff reporters, ^œ[US' breakthrough in nuclear fusion targets at 'nuclear weapon research, but far from practical use'](#), *Global Times*, December 14, 2022)

We have a long way to go and many seemingly impossible hurdles to overcome before this 'advance' is in any way useful in generating electricity, but it really could be very 'useful' as ^œ[another avenue to igniting thermonuclear bombs](#)! What a strange and myopic species we are to be sure!

Over the past forty and more years a variety of means of dealing with the 'problems' associated with climate change, pollution and 'global warming' have been promoted. The 'potential solutions' promoted have, all-too-often, been used as reason enough for procrastination, funneling funding into 'necessary research' as an alternative to addressing the issues themselves.⁷⁵⁵

Western capitalists have, indeed, over the past two hundred years, myopically set about changing the world to their short-term 'advantage', discounting warnings which might require them to change their behavior. Now, it is increasingly clear that they have, finally, gone a step too far.

[CO₂ increase since 1962 is 100 times faster than previous natural increases](#) 📅

 (21/10/23) (21/03/24) (25/06/24)

The atmospheric carbon dioxide increase of the Holocene (the period reaching more than 10,000 years before the Industrial Revolution - [one of the rare intervals of warm climate](#) that have occurred over the ice age cycles of the last million years) was 20 parts per million (ppm), over *more than 10,000 years*.

From 2011 - 2019 a similar atmospheric carbon dioxide increase *occurred in just 8 years*.

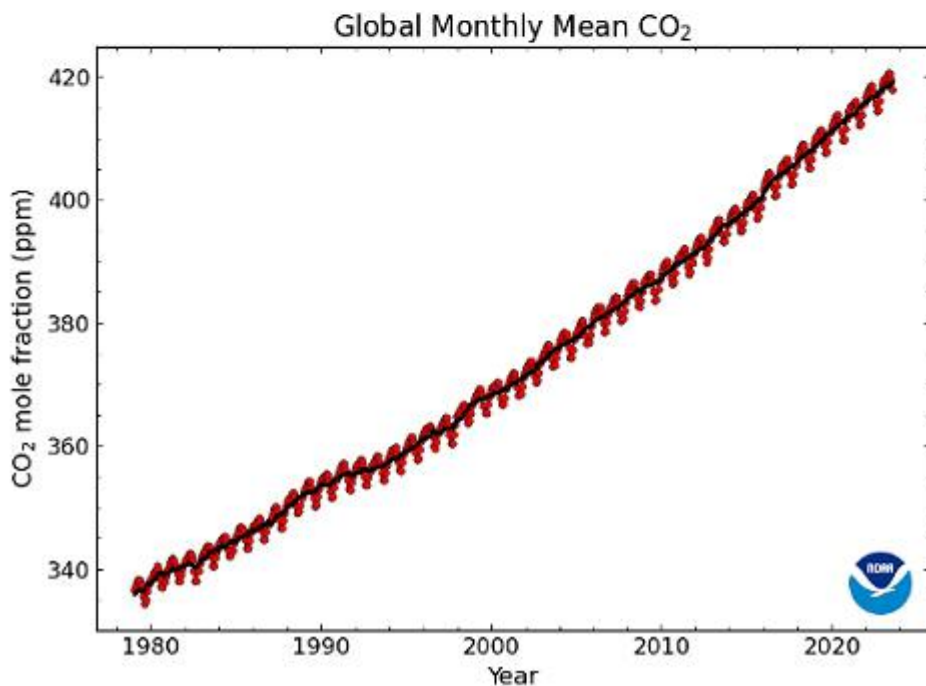

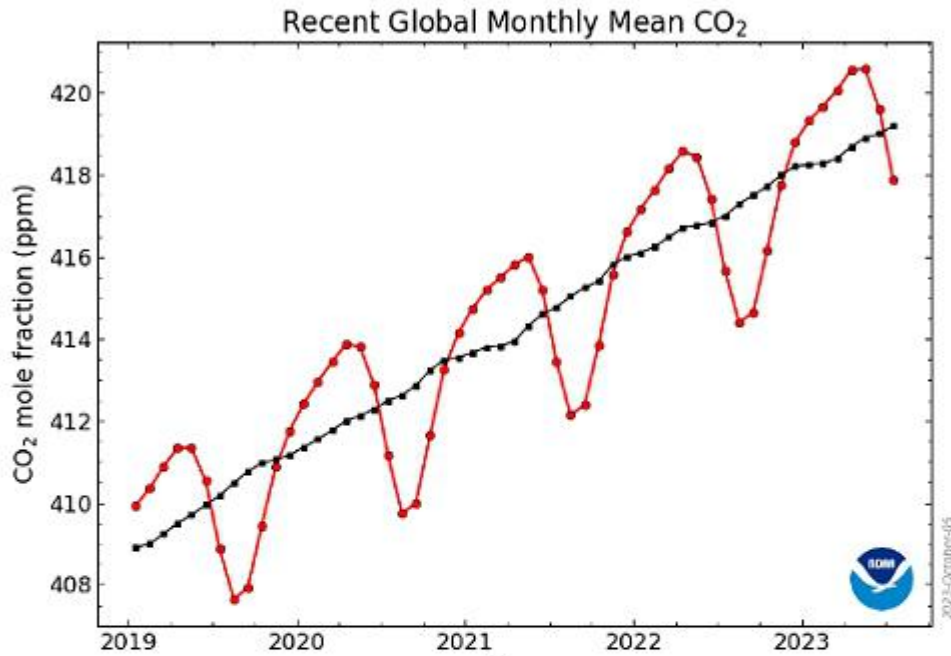

Despite all the conferences, resolutions, 'green energy' solutions of the past several decades and the absorption of more than 90% of global greenhouse emissions by the oceans, the buildup of atmospheric greenhouse gasses continues unabated:

Global Monthly Mean CO₂

July 2023: 417.87 ppm

July 2022: 415.68 ppm

Last updated: Oct 05, 2023

Between January 2000 and October, 2021, ^œthe global atmospheric carbon dioxide amount grew by 43.5 ppm, an increase of 12 percent⁷⁵⁶.

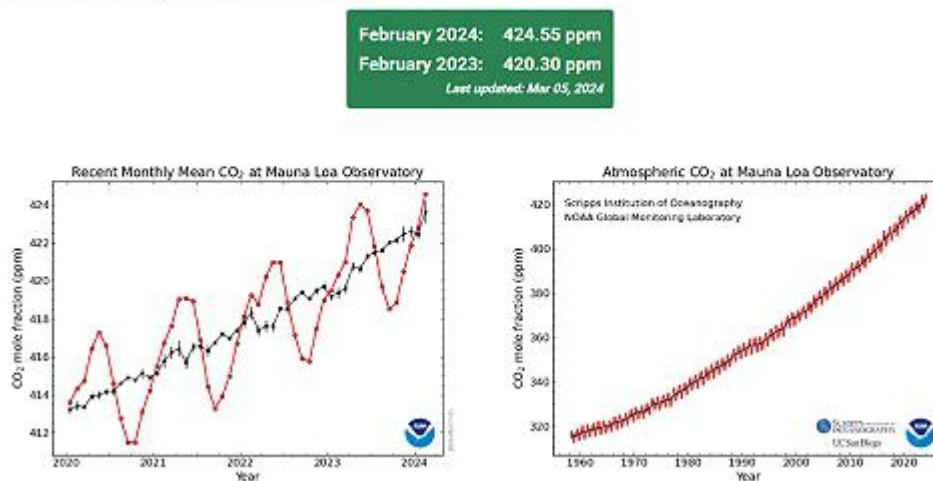

The annual rate of increase in atmospheric carbon dioxide since 1962 is about *100 times faster than previous natural increases*.

Atmospheric CO₂ concentration ^œin 2011 was 393.25 ppm. The Mauna Loa January 2022 figure was 418.19 ppm (an increase of 24.94 ppm) and the ^œgrowth in atmospheric CO₂ is not linear!⁷⁵⁷

Indeed, two years on, in March 15, 2024, the daily average carbon dioxide (CO₂) at Mauna Loa, Hawaii, was ^œ[427.93 parts per million \(ppm\)](#)

The *National Oceanic and Atmospheric Administration* (NOAA) explains and illustrates the ^œ[Mauna Loa CO₂ February monthly averages over the five years 2020-2024](#)

Monthly Average Mauna Loa CO₂

Ying Cui, Brian Schubert and Hope Jahren, in a research study entitled 'A 23 m.y. record of low atmospheric CO₂', have shown that current atmospheric CO₂ levels are higher than any found since the end of the Paleogene Period 23.03 million years ago:

...[P]resent-day CO₂ (412 ppmv) exceeds the highest levels that Earth experienced at least since the Miocene, further highlighting the present-day disruption of long-established CO₂ trends within Earth's atmosphere.

(Ying Cui, Brian A. Schubert and A. Hope Jahren, ^œ[A 23 m.y. record of low atmospheric CO₂](#)', Geological Society of America, *GEOLOGY*, Volume 48, May 29, 2020)

A *Geology* preamble has explained the study's importance:

This research, published this week in *Geology*, is a next-level study measuring the relative amount of these carbon isotopes in fossil plant materials and calculating the CO₂ concentration of the atmosphere under which the ancient plants grew.

Furthermore, Schubert and colleagues' new CO₂ "timeline" revealed no evidence for any fluctuations in CO₂ that might be comparable to the dramatic CO₂ increase of the present day, which suggests today's abrupt greenhouse disruption is unique across recent geologic history.

Another point, important to geological readers, is that because major evolutionary changes over the past 23 million years were not accompanied by large changes in CO₂, perhaps ecosystems and temperature might be more sensitive to smaller changes in CO₂ than previously thought. As an example: The substantial global warmth of the middle Pliocene (5 to 3 million years ago) and middle Miocene (17 to 15 million years ago), which are sometimes studied as a comparison for current global warming, were associated with only modest increases in CO₂.

(^œ[Study Shows Today's Atmospheric Carbon Dioxide Levels Greater than the Past 23 Million-Year Record](#), *Geology*, 01 June 2020)

Indeed, a research paper by Caitlyn Witkowski *et al* entitled 'Continuous sterane and phytane $\delta^{13}\text{C}$ record reveals a substantial $p\text{CO}_2$ decline since the mid-Miocene', suggests that the current conservative estimation of atmospheric temperatures and CO_2 levels might be much too low.

'Temperature might be more sensitive to smaller changes in CO_2 than previously thought'. As Witkowski explains, "The temperature rise we found is much larger than the 2.3 to 4.5 degrees that the UN climate panel, IPCC, has been estimating so far".

(Caitlyn R. Witkowski *et al*, [Continuous sterane and phytane \$\delta^{13}\text{C}\$ record reveals a substantial \$p\text{CO}_2\$ decline since the mid-Miocene](#), *Nature Communications*, No.5192, 18 June 2024)

(See also: [CO₂ puts heavier stamp on temperature than thought](#), *Royal Netherlands Institute For Sea Research*, 24 June, 2024)

Arctic basal melt rates are several orders of magnitude higher than predictions 🌊

 (09/05/23) (16/10/23) (14/09/24)

As we have seen, annual surface air temperatures in the Arctic (60° - 85°N) have been the highest on record and the volume of Arctic sea-ice in the month of September 2019 (after the melting season) declined by more than 50% compared to the mean value for 1979-2019. And, of course, 2020 results are still lower. As the US *National Snow and Ice Data Center* explained:

This year's [2020] minimum set on September 15 was 350,000 square kilometers (135,000 square miles) above the record minimum extent in the satellite era, which occurred on September 17, 2012 (Figure 2a). It is also 2.51 million square kilometers (969,000 square miles) below the 1981 to 2010 average minimum extent, which is equivalent in size to roughly the states of Alaska, Texas, and Montana combined, or Greenland and Finland combined.

The 42-minimum-extent values in the satellite record can be broken down into three 14-year periods. Most notably, minimum extents in the last 14 years of the time series are the lowest 14 in the 42-year record

Arctic Sea Ice Extent (Area of ocean with at least 15% sea ice)

(National Snow and Ice Data Center, ^œ[Arctic sea ice decline stalls out at second lowest minimum](#), September 21, 2020)

(For regularly updated information see

^œ[Charctic Interactive Sea Ice Graph: Sea Ice Today Tool](#))

As Arctic sea-ice volume continues to fall, there is other, perhaps even more concerning, melting going on! Tun Jan Young *et al* explain:⁷⁵⁸

Michalea King *et al* have described one of the consequences of all this. The Greenland Ice Sheet (GrIS) has reached a tipping point of sorts. There has, since the start of this century, been a switch to a new dynamic state of sustained mass loss that will persist even under a decline in surface melt:

The Greenland Ice Sheet is losing mass at accelerated rates in the 21st century, making it the largest single contributor to rising sea levels. Faster flow of outlet glaciers has substantially contributed to this loss, with the cause of speedup, and potential for future change, uncertain.

... [I]ncreased glacier discharge was due almost entirely to the retreat of glacier fronts, rather than inland ice sheet processes, with a remarkably consistent speedup of 4-5% per km of retreat across the ice sheet. ...[W]idespread retreat between 2000 and 2005 resulted in a step-increase in discharge and a switch to a new dynamic state of sustained mass loss that would persist even under a decline in surface melt.

(Michalea D. King *et al*, ^œ[Dynamic ice loss from the Greenland Ice Sheet driven by sustained glacier retreat](#), *Communications Earth & Environment* Vol. 1, Article No. 1, 13 August 2020)

Niklas Boers and Martin Rypdal elaborate:⁷⁵⁹

A further cause of Greenland Ice Sheet melting has been explained by Gabriel Lewis *et al*,

Satellite measurements and computer models have shown that the reflectivity (or albedo) of the Greenland Ice Sheet has decreased in recent decades, causing increased melt and sea level rise. It is

unknown whether this albedo decline is due to increased impurities in the snow, larger snow grain sizes, or both. Field measurements show that the amount of impurities is too small to affect albedo in our field area. However, larger snow grain sizes could lower albedo enough to cause the observed trend. We demonstrate how a recent increase in the frequency of atmospheric high pressure systems over Greenland increases grain sizes via several mechanisms and contributes to Greenland's observed albedo decline and faster melt.

(Gabriel Lewis *et al*, [∞][Atmospheric Blocking Drives Recent Albedo Change Across the Western Greenland Ice Sheet Percolation Zone](#), *Geophysical Research Letters*, 17 May 2021)

Rain seldom falls on the highest point on the Greenland Ice Sheet. It is simply too cold for that - or, it was!

On August 14, 2021, rain was observed at the highest point on the Greenland Ice Sheet for several hours, and air temperatures remained above freezing for about nine hours. This was the third time in less than a decade, and the latest date in the year on record, that the National Science Foundation's Summit Station had above-freezing temperatures and wet snow.

There is no previous report of rainfall at this location (72.58°N 38.46°W), which reaches 3,216 meters (10,551 feet) in elevation. Earlier melt events in the instrumental record occurred in 1995, 2012, and 2019; prior to those events, melting is inferred from ice cores to have been absent since an event in the late 1800s. The cause of the melting event that took place from August 14 to 16, 2021, was similar to the events that occurred this late July, where a strong low pressure center over Baffin Island and high air pressure southeast of Greenland conspired to push warm air and moisture rapidly from the south.

Above freezing temperatures and rainfall were widespread to the south and west of Greenland during the three-day period, with exceptional readings from several remote weather stations in the area. Total rainfall on the ice sheet was 7 billion tons. At South Dome, the highest point on the southern lobe of the ice sheet at 2,850 meters (9,350 feet) elevation melt was recorded by satellite during all three days of the warm event, and the early part of this period (Figure 3) shows the rapid warming and persistent above-freezing conditions for August 14 and 15.

(Greenland Ice Sheet Today, [∞][Rain at the summit of Greenland](#), *National Snow and Ice Data Center*, August 18, 2021)

Slater and Straneo have provided further evidence of the nature of rapid ice loss from the Greenland Ice Sheet: ⁷⁶⁰

Josep Bonsoms *et al*, in a research article entitled 'Rising Extreme Meltwater Trends in Greenland Ice Sheet (1950-2022): Surface Energy Balance and Large-Scale Circulation Changes', have summarized their findings:

The Greenland Ice Sheet (GrIS) meltwater runoff has increased considerably since the 1990s, leading to implications for the ice sheet mass balance and ecosystem dynamics in ice-free areas. Extreme weather events will likely continue to occur in the coming decades. Therefore, a more thorough understanding of the spatiotemporal patterns of extreme melting events is of interest.

This study aims to analyze the evolution of extreme melting events across the GrIS and determine the climatic factors that drive them.

Specifically, we have analyzed extreme melting events (90th percentile) across the GrIS from 1950 to 2022 and examined their links to the surface energy balance (SEB) and large-scale atmospheric circulation. Extreme melting days account for approximately 35%-40% of the total accumulated melting per season.

We found that extreme melting frequency, intensity, and contribution to the total accumulated June-August (summer) melting show a statistically significant upward trend at a 95% confidence level. The largest trends are detected across the northern GrIS. The trends are independent of the extreme melting percentile rank (90th, 97th, or 99th) analyzed and are consistent with average melting trends that exhibit an increase in similar magnitude and spatial configuration. Radiation plays a dominant role in controlling the SEB during extreme melting days.

The increase in extreme melting frequency and intensity is driven by the increase in anticyclonic weather types during summer and more energy available for melting. Our results help to enhance the understanding of extreme events in the Arctic.

(Josep Bonsoms *et al*, [[∞]Rising Extreme Meltwater Trends in Greenland Ice Sheet \(1950-2022\): Surface Energy Balance and Large-Scale Circulation Changes](#), *Journal of Climate*, Vol. 37: I. 18, Pp 4851-4866, 15 September 2024)

It is easy, in a world in which warmongering has become endemic and geopolitical tensions have been exacerbated by nations seeking to retain or diminish hegemonic dominance, to forget that the world is warming, ice is melting, and environments are being polluted at accelerating rates. While pursuing our petty human ambitions and nurturing our fragile egos may be human distractions, they do nothing to alter the natural forces our rampant mismanagement of the natural world are unleashing.

Enrico Ciraci *et al* provide further information on rapidly changing melt rates of the Greenland ice sheet. As they explain:

Warming of the ocean waters surrounding Greenland plays a major role in driving glacier retreat and the contribution of glaciers to sea level rise.

The melt rate at the junction of the ocean with grounded ice - or grounding line - is, however, not well known. Here, we employ a time series of satellite radar interferometry data from the German TanDEM-X mission, the Italian COSMO-SkyMed constellation, and the Finnish ICEYE constellation to document the grounding line migration and basal melt rates of Petermann Glacier, a major marine-based glacier of Northwest Greenland.

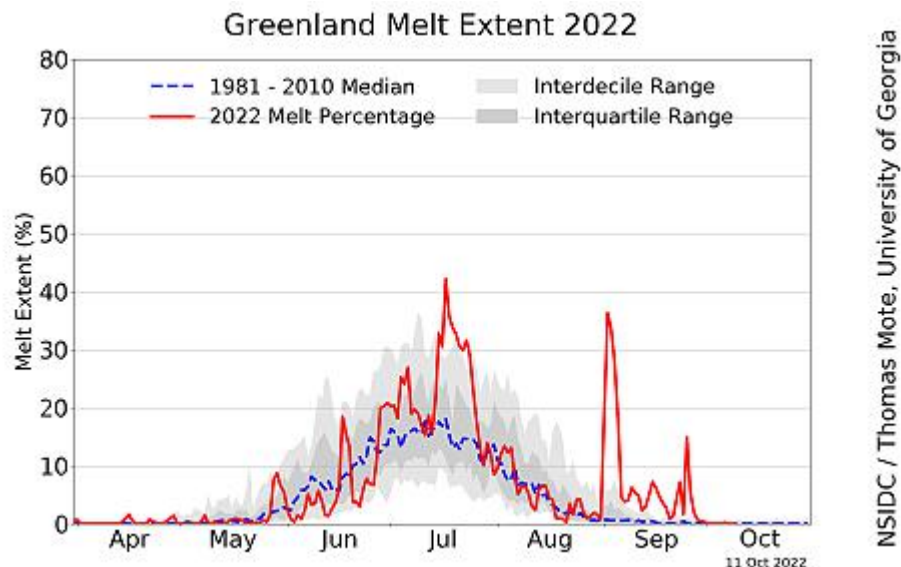

We find that the grounding line migrates at tidal frequencies over a kilometer-wide (2 to 6 km) grounding zone, which is one order of magnitude larger than expected for grounding lines on a rigid bed. The highest ice shelf melt rates are recorded within the grounding zone with values from 60 ± 13 to 80 ± 15 m/y along laterally confined channels. As the grounding line retreated by 3.8 km in 2016 to 2022, it carved a cavity about 204 m in height where melt rates increased from 40 ± 11 m/y in 2016 to 2019 to 60 ± 15 m/y in 2020 to 2021. In 2022, the cavity remained open during the entire tidal cycle.

Such high melt rates concentrated in kilometer-wide grounding zones contrast with the traditional plume model of grounding line melt which

predicts zero melt. High rates of simulated basal melting in grounded glacier ice in numerical models will increase the glacier sensitivity to ocean warming and potentially double projections of sea level rise. (Enrico Ciraci *et al*, ^œ[Melt rates in the kilometer-size grounding zone of Petermann Glacier, Greenland, before and during a retreat, PNAS](#) Vol.120, No.20, May 08, 2023)

The US *National Snow and Ice Data Center* described conditions in September, 2022:

Unprecedented in the 44 years of continuous satellite monitoring, a late season heat wave and melt event occurred in Greenland from September 2 to 5. At the peak on September 3, more than one-third (36 percent) of the ice sheet, or around 600,000 square kilometers (232,000 square miles) had surface melting.... The only comparable event so late in the season was in 2003, in late August (in terms of melt area) when temperatures at Summit reached only -2.5 degrees Celsius (27.5 degrees Fahrenheit). The melt event began along the southwestern coast on September 2, and moved rapidly inland and northward on September 3, accompanied by heavy rainfall that enhanced melt at lower elevations, and enhanced snowfall at higher elevations....

(*National Snow and Ice Data Center*, ^œ[Overview of conditions](#), September 12 2022)

We have, for most of the last century, believed that the Greenland Ice Sheet is so massive and stable that significant short-term melting is highly improbable and claims that it might significantly contribute to sea-level rise this century simply alarmist. We need to rethink all this. The Greenland Ice Sheet (GrIS) is not a 36 million (^œ[or even a 3 million](#)) year old block of ice! It has, within the past million years, completely melted and reformed - possibly several times! ^œ[Andrew Christ *et al* explain](#).

Understanding Greenland Ice Sheet history is critical for predicting its response to future climate warming and contribution to sea-level rise.

We analyzed sediment at the bottom of the Camp Century ice core, collected 120 km from the coast in northwestern Greenland. The sediment, frozen under nearly 1.4 km of ice, contains well-preserved fossil plants and biomolecules sourced from at least two ice-free warm periods in the past few million years.

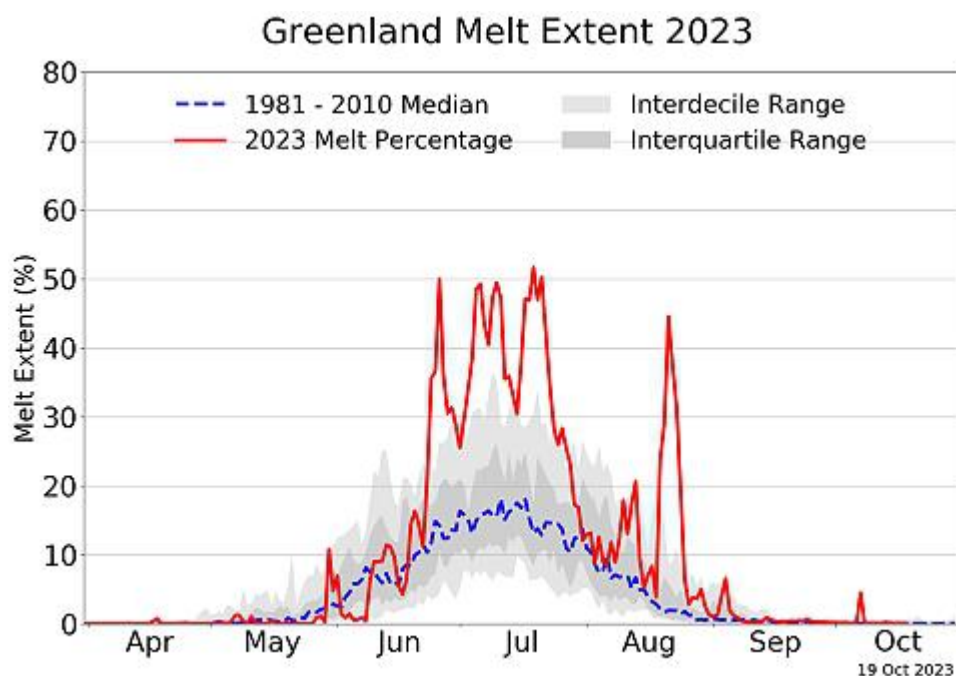

Enriched stable isotopes in pore ice indicate precipitation at lower elevations than present, implying ice-sheet absence. The similarity of cosmogenic isotope ratios in the upper-most sediment to those measured in bedrock near the center of Greenland suggests that the ice sheet melted and re-formed at least once during the past million years.

(Andrew J. Christ *et al*, [A multimillion-year-old record of Greenland vegetation and glacial history preserved in sediment beneath 1.4 km of ice at Camp Century](#), *PNAS* 118 (13) e2021442118, March 30, 2021)

In July 2023, the northern hemisphere was experiencing unprecedented heatwaves. As several reports suggested, humanity is in 'uncharted territory'. A National Snow and Ice Data Center (NSIDC) report explained the impact of this warming on the Greenland Ice Sheet:

Beginning on August 20, surface melt extent on the ice sheet increased rapidly, following a period when only 10 to 20 percent of the ice sheet melted in the second half of July (Figure 1a). Melt area peaked at nearly 730,000 square kilometers (282,000 square miles) on August 22, covering about 45 percent of the ice sheet (Figure 1b). Melting began in the southwest and spread toward the higher central areas of the ice sheet and northward on August 22, and then eastward on August 23 and beyond (Figure 1c).

Cumulative melt-day area is the second highest in the 45-year satellite record with over 30 million square kilometers (11.5 million square miles). This can be compared to the extreme record year of 2012, which accumulated over 45 million square kilometers (17.4 million square miles) by late August. Note that 2010 finished the year with a higher total than the current date for 2023 because of a very late melt event in early September.

(National Snow and Ice Data Center, [Overview of conditions](#), October 19, 2023)

Not only have Arctic surface air temperatures increased, ocean temperature increases in the northern Atlantic Ocean have led to a warming of Arctic seas ⁷⁶¹. Igor Polyakov *et al* have explained:

In recent decades there has been a dramatic decline in seasonal sea ice extent in the Arctic Ocean, with a more recent year-around decline

in sea ice extent, area, and volume.... This change has shifted the local radiative balance resulting in a positive ice-albedo feedback mechanism as increasing lead fraction and surface melt pond areas in decaying Arctic sea ice facilitate enhanced upper-ocean solar heating and more rapid melting of ice floes.... Moreover, it was hypothesized that the declining sea ice has larger-scale hemispheric impacts on the North Atlantic Oscillation and, in consequence, midlatitude weather patterns....

Heat associated with oceanic currents originating from lower latitudes provides an important, and year-round, source of heat to the Arctic Ocean.... The dominant external source of oceanic heat is the warm (temperature > 0°C) and salty water of Atlantic origin [Atlantic Water (AW)], which is distributed throughout the deep basins at intermediate depths (~150-900 m) and holds sufficient heat to melt the Arctic sea ice 3-4 times over....

As ice thins - through atmospheric forcing, changing ocean heat fluxes, and feedbacks - upper-ocean stratification is responding and a new Arctic state is emerging, which may not be easily reversed. For example, a large anomaly in AW heat input coupled with shoaling may lead, through the ice/ocean-heat feedback, to an expanding and more permanent Atlantic-dominated state wherein the hydrographic structure of the halocline no longer provides sufficient insulation between the intermediate depth AW and the sea ice, even when the heat flux associated with the AW is relaxed.

(Igor V. Polyakov *et al*, [Weakening of Cold Halocline Layer Exposes Sea Ice to Oceanic Heat in the Eastern Arctic Ocean](#), American Meteorological Society, *Journal of Climate*, Vol.33, Issue 18, Pp. 8107-8123. 2020)

Given the rate at which ice sheets in both the northern and southern hemispheres are retreating, complacency is little more than insanity! Tine Rasmussen and Erik Thomsen have compared retreat rates and timing for both the last deglaciation, 20,000 -10,000 years ago, and for the present. Their conclusion:

...[G]iven the overall temporal resolution of the study, we suggest a time-frame for the break-up ranging from nearly instantaneous to about 50 - 100 years. This corresponds to a retreat rate of 2.5 km/year for the Bølling transition and 2 km/year for the Holocene transition. These values are also comparable with a number of recent rates measured in Antarctica of 0.6->2 km/year ... and in Greenland ..., and also with deglacial retreat rates calculated for the ice sheet of the northern North Sea and the Irish Ice Sheet...

It has previously been suggested that subsurface warming was the main cause for the rapid retreat and break-up of the ice streams during the last glacial and deglaciation periods.... A recent model study of the deglaciation of the Svalbard-Barents Sea Ice Sheet reaches similar conclusions.... Numerous modern studies indicate that incursion of subsurface warm water underneath ice shelves and outlet glaciers have accelerated the disintegration of marine-based ice in both Greenland... and Antarctica.... Together with atmospheric warming, this incursion constitute the major forcings for the recent increase in ice calving and melting.

(Tine L.Rasmussen and Erik Thomsen, [Climate and ocean forcing of ice-sheet dynamics along the Svalbard-Barents Sea ice sheet during](#)

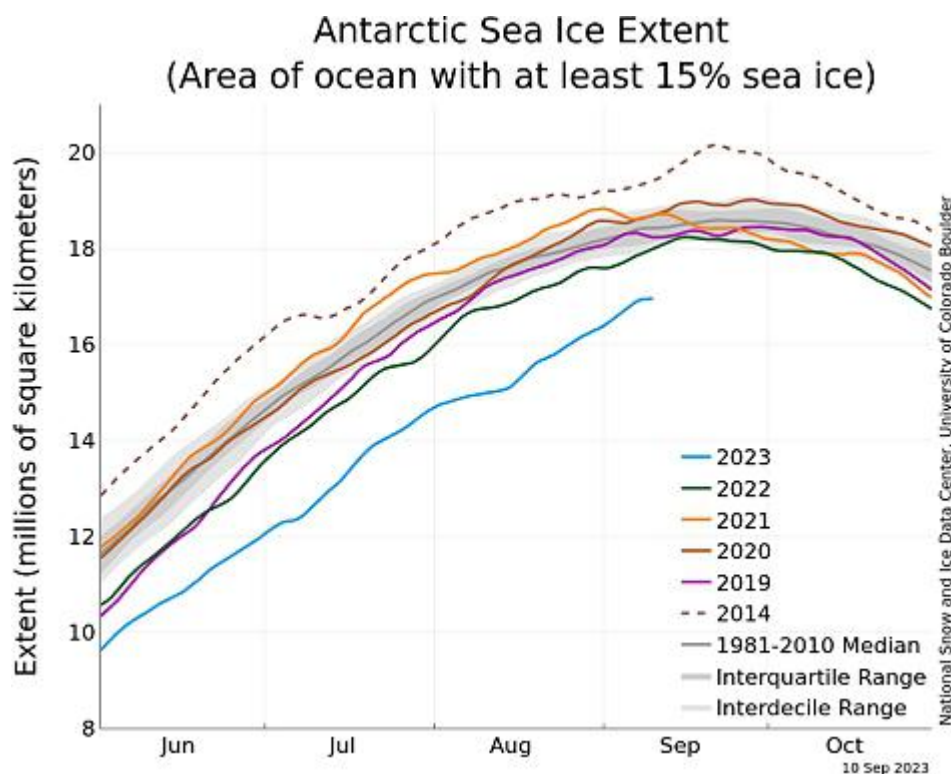

the deglaciation ~20,000 -10,000 years BP, *Quaternary Science Advances*, Vol. 3, April 2021, 100019 [references deleted])

Miriam Jones *et al* have provided information on the continuing loss of sea ice in the Bering Sea, affected by both increasing atmospheric CO₂ levels and warm water inflow from the Pacific Ocean. As they explain:

...[O]ver the last 5500 years, sea ice in the Bering Sea decreased in response to increasing winter insolation and atmospheric CO₂, suggesting that the North Pacific is highly sensitive to small changes in radiative forcing. We find that CE 2018 sea ice conditions were the lowest of the last 5500 years, and results suggest that sea ice loss may lag changes in CO₂ concentrations by several decades.

(Miriam C. Jones *et al*, [∞][High sensitivity of Bering Sea winter sea ice to winter insolation and carbon dioxide over the last 5500 years](#), *Science Advances*, Vol. 6, no. 36, 02 Sep 2020)

And it's not just the Arctic! Antarctica is also warming! 🐧

The graph above shows Antarctic sea ice extent as of September 10, 2023, along with daily ice extent data for four previous years and the record maximum year. 2023 is shown in blue, 2022 in green, 2021 in orange, 2020 in brown, 2019 in magenta, and 2014 in dashed brown. The 1981 to 2010 median is in dark gray. The gray areas around the median line show the interquartile and interdecile ranges of the data. Sea Ice Index data.

Credit: [∞][National Snow and Ice Data Center](#)

As the National Snow and Ice Data Center report says:

...If dramatically lower sea ice extent continues to the 2024 summer minimum and beyond, much more of the Antarctic coastline will be exposed to ocean waves and marine climate. This may lead to two opposing impacts: erosion of more perennial coastal ice and ice shelves, destabilizing the ice sheet; or increased accumulation near the coast, offsetting in part the threat of rising sea level.

One can but suggest that the old aphorism should be applied:

By all means hope for the best -
But Always plan for the worst!

Ariaan Purich and Edward Doddridge conclude:

The current extremely low sea ice will have a range of impacts. Changed ocean stratification and circulation will alter basal melting beneath ice shelves.... Greater coastal exposure will increase coastal erosion and reduce ice-shelf stability.... Changes in dense shelf water production will alter bottom water formation and deep ocean ventilation.... Sea ice changes will also have contrasting influences on Adélie and emperor penguin colonies..., and substantially alter human activities along the Antarctic coastline.

Anthropogenic greenhouse gas emissions have been attributed as the primary cause of Southern Ocean warming..., and here we suggest a potential link to a regime shift in Antarctic sea ice. While for many years, Antarctic sea ice increased despite increasing global temperatures..., it appears that we may now be seeing the inevitable decline, long projected by climate models.... The far-reaching implications of Antarctic sea ice loss highlight the urgent need to reduce greenhouse gas emissions.

(Ariaan Purich and Edward W. Doddridge, ^œ[Record low Antarctic sea ice coverage indicates a new sea ice state](#), *Communications Earth & Environment* Vol. 4, Article no.:314, September 13, 2023 - footnotes deleted)

The focus on Arctic ocean warming is understandable but does not preclude similar warming in the Southern Ocean with ice-shelf erosion similar to that being observed in Greenland. Ching-Yao Lai *et al* have described what is currently happening in the Antarctic:

Atmospheric warming threatens to accelerate the retreat of the Antarctic Ice Sheet by increasing surface melting and facilitating 'hydrofracturing'... where meltwater flows into and enlarges fractures, potentially triggering ice-shelf collapse.... The collapse of ice shelves that buttress... the ice sheet accelerates ice flow and sea-level rise.... However, we do not know if and how much of the buttressing regions of Antarctica's ice shelves are vulnerable to hydrofracture if inundated with water.

...[W]e provide two lines of evidence suggesting that many buttressing regions are vulnerable.

First, we trained a deep convolutional neural network (DCNN) to map the surface expressions of fractures in satellite imagery across all Antarctic ice shelves.

Second, we developed a stability diagram of fractures based on linear elastic fracture mechanics to predict where basal and dry surface fractures form under current stress conditions.

We find close agreement between the theoretical prediction and the DCNN-mapped fractures, despite limitations associated with detecting fractures in satellite imagery.

Finally, we used linear elastic fracture mechanics theory to predict where surface fractures would become unstable if filled with water. Many regions regularly inundated with meltwater today are resilient to hydrofracture-stresses are low enough that all water-filled fractures are stable. Conversely, 60 ± 10 per cent of ice shelves (by area) both

buttress upstream ice and are vulnerable to hydrofracture if inundated with water. The DCNN map confirms the presence of fractures in these buttressing regions. Increased surface melting could trigger hydrofracturing if it leads to water inundating the widespread vulnerable regions we identify. These regions are where atmospheric warming may have the largest impact on ice-sheet mass balance. (Ching-Yao Lai *et al*, [∞][Vulnerability of Antarctica's ice shelves to meltwater-driven fracture](#), *Nature*, Vol. 584, pages 574-578, Published: 26 August 2020)

Jeremy Bassis, in an explanatory article in the same Journal entitled 'Crevasse analysis reveals vulnerability of ice shelves to global warming', concludes:

Lai *et al.* focus on atmospheric warming as suspect number one, but it remains unclear how tightly the fate of ice shelves is tied to suspect number two: oceanic warming. At present, atmospheric temperatures remain too cold over much of the Antarctic ice sheet to promote substantial surface melting. By contrast, a warming ocean has been linked to the thinning and retreat of ice shelves in the Amundsen Sea Embayment in West Antarctica. ... [W]arm ocean water is rapidly thinning these shelves and sculpting deep basal channels into their undersides. These channels have been linked to increased fracturing of the ice-shelf, but surface melt can also drain into surface depressions associated with the channels, forming rivers that efficiently remove water from the surface of the ice-shelf and thereby prevent widespread inundation of the ice-shelf. What happens on the top of an ice-shelf is thus tightly linked to what happens at the bottom.

(Jeremy N. Bassis, [∞][Crevasse analysis reveals vulnerability of ice shelves to global warming](#), *Nature*, News and Views 26 August 2020)

The thinning and retreat of ice shelves in West Antarctica is, indeed, cause for concern. Heather Selley *et al* have documented a widespread increase in dynamic imbalance in the Getz region which more than matches the thinning and retreat of ice shelves in the Amundsen Sea Embayment. As they explain:

The Getz region of West Antarctica is losing ice at an increasing rate; however, the forcing mechanisms remain unclear. Here we use satellite observations and an ice sheet model to measure the change in ice speed and mass balance of the drainage basin over the last 25-years.

Our results show a mean increase in speed of 23.8 % between 1994 and 2018, with three glaciers accelerating by over 44 %. Speedup across the Getz basin is linear, with speedup and thinning directly correlated confirming the presence of dynamic imbalance. Since 1994, 315 Gt of ice has been lost contributing 0.9 ± 0.6 mm global mean sea level, with increased loss since 2010 caused by a snowfall reduction. Overall, dynamic imbalance accounts for two thirds of the mass loss from this region of West Antarctica over the past 25-years, with a longer-term response to ocean forcing the likely driving mechanism....

They conclude:

On all glaciers, the speed increase coincides with regions of high surface lowering, with an ~50% speed up corresponding to an ~5% reduction in ice thickness....increasing the rate of ice loss by four times in the 2010s compared to the 1990s.

(Heather L. Selley *et al*, [∞][Widespread increase in dynamic imbalance in](#)

Alison Banwell *et al* described the 2019-2020 surface melt duration and extent on the northern George VI Ice Shelf (GVIIS):

Using optical satellite imagery from Landsat 8 (2013 to 2020) and Sentinel-2 (2017 to 2020), record volumes of surface meltwater ponding were also observed on the northern GVIIS in 2019/2020, with 23% of the surface area covered by 0.62 km³ of ponded meltwater on 19 January. These exceptional melt and surface ponding conditions in 2019/2020 were driven by sustained air temperatures ≥ 0 °C for anomalously long periods (55 to 90 h) from late November onwards, which limited meltwater refreezing.

The sustained warm periods were likely driven by warm, low-speed (≈ 7.5 m s⁻¹) northwesterly and northeasterly winds and not by foehn wind [type of wind that occurs on the leeward or downwind side of a mountain] conditions, which were only present for 9 h total in the 2019/2020 melt season.

Increased surface ponding on ice shelves may threaten their stability through increased potential for hydrofracture initiation; a risk that may increase due to firn [type of snow that has been left over from past seasons and has been recrystallized] air content depletion in response to near-surface melting.

(Alison F. Banwell *et al*, The 32-year record-high surface melt in 2019/2020 on the northern George VI Ice Shelf, Antarctic Peninsula, *The Cryosphere*, 15, 909-925, 25 February 2021)

This process is not confined to the West Antarctic Peninsula, The continent of Antarctica is on the move (or is it 'melt'?).

Daisuke Hirano *et al* in a *Nature Communications* article (Vol. 11, No. 4221, 24 August 2020) entitled ^{oe}[Strong ice-ocean interaction beneath Shirase Glacier Tongue in East Antarctica](#), describe direct observational evidence of

...high basal melt rates (7-16 m yr⁻¹⁷⁶²) beneath an East Antarctic ice-shelf, Shirase Glacier Tongue, driven by southward-flowing warm water guided by a deep continuous trough extending to the continental slope. The strength of the alongshore wind controls the thickness of the inflowing warm water layer and the rate of basal melting....

We have, over the past fifty years, lulled ourselves into complacency over the possibility of rapid deglaciation in the Antarctic. The presumption has been that any deglaciation will be linear and slow moving, occurring over millennial time scales - giving humanity plenty of time to adjust to consequent sea level rise.

Michael Weber *et al*, in a recent examination of iceberg-rafter debris data from the Antarctic Iceberg Alley provide evidence of a much faster, decadal step process linked to sets of 'tipping points' which initiate destabilization. As they explain:

The majority of Antarctic icebergs route through Iceberg Alley after calving from the Antarctic margin... and traveling counter-clockwise around Antarctica.... Melt rates remain low within the cold Antarctic Coastal Current until the warmer Antarctic Circumpolar Current is reached, after which icebergs ablate rapidly and release their iceberg-rafter debris (IBRD) in this iceberg cemetery.

Although most of the coarser debris is released from sediment-laden basal ice close to the grounding line, fine-grained, englacial IBRD travels far and is the dominant size fraction (1 - 2 mm in diameter) found in Iceberg Alley sediment sites. Since icebergs account for approximately half of the total AIS [Antarctic Ice shelf] mass loss..., the IBRD record from Iceberg Alley provides a sensitive, nearly continuous reconstruction of AIS dynamics by capturing an integrated signal of AIS mass loss....

In this study, we primarily rely on published IBRD records from Iceberg Alley sites... and use the timing and magnitude of the deglacial AID [Antarctic Ice-Sheet Discharge] events... to decipher the pace of [Antarctic Ice shelf] destabilization and re-stabilization....

...[T]he 8-year sample resolution indicates that the majority of AID events took a decade or less to initiate and terminate. This implies that it could have taken substantially less than a decade to accelerate and slow down mass loss from the AIS during deglaciation and that the true pace of change could only be addressed with an even higher sedimentation rate site. We should add that relative uncertainties of only several decades for the multiple century-long AID events... lend further credit to the robustness of the above numbers.

(Michael E. Weber *et al*, [Decadal-scale onset and termination of Antarctic ice-mass loss during the last deglaciation](#), *Nature Communications*, Vol.12, Article No.: 6683, 18 November 2021 [references deleted])

We need to remember that we are dealing with very different climatic conditions when comparing current Antarctic ice shelf destabilization with that which occurred at the start of the Holocene period. The greenhouse effect of the early Holocene resulted from a carbon dioxide increase of a mere [20ppm over more than 10 thousand years](#). Our current greenhouse effect results from carbon dioxide increases of 20ppm *over periods of less than 10 years*.⁷⁶³

We are, already, in uncharted territory. There is no reasonable analog for current rates of greenhouse warming in earth's history. Our near future could well include much faster rates of stepped deglaciation than those found during the onset of the Holocene.

Of course, global warming is just that. Not only are the Arctic and Antarctic regions warming, so is the rest of the planet. Hu Yang *et al*, focusing on tropical regions, have explained what's happening there:

Both observations and climate simulations have shown that the edges of tropics and associated subtropical climate zone are shifting toward higher latitudes under climate change. The underlying dynamical mechanism driving this phenomenon that has puzzled the scientific community for more than a decade, however, is still not entirely clear.

A number of investigations argued that the atmospheric processes, in the absence of the ocean dynamics, lead to the tropical expansion. For example, increasing greenhouse gases, decreasing ozone and increasing aerosols are suggested to be the dominant factors contributing to expanding the tropics. However, these investigations are mostly based on model simulations, and observations show a much more complex evolution of expanding tropics.

By examining the tropical width individually over each ocean basin, in this study, we find that the width of the tropics closely follows the

displacement of oceanic midlatitude meridional temperature gradients (MMTG). Under global warming, as a first-order response, the subtropical convergence zone experiences more surface warming due to background convergence of surface water. Such warming induces poleward shift of the oceanic MMTG and drives the tropical expansion.

As they conclude:

The enhanced subtropical warming and associated poleward advance of the MMTG drives the tropical expansion and shift the atmospheric winds, jet streams, and storm tracks toward poles.... The displacement of atmospheric winds, in turn, forces a poleward shift of the wind-driven ocean circulation and causes a migration of the oceanic subtropical front toward higher latitudes.... The migration of the subtropical front further shift the MMTG toward poles, activating a positive feedback.

(Hu Yang *et al*, [[∞]Tropical Expansion Driven by Poleward Advancing Midlatitude Meridional Temperature Gradients](#), *JGR Atmospheres*, Vol. 125, Issue 16, 27 August 2020)

It really is 'Global' warming! The tropics are getting hotter! 🌡️

While the current warming of arctic and antarctic regions is cause for concern, Andrew Nottingham *et al* show that further warming of tropical soils is equally concerning. As they explain:

Tropical soils contain one-third of the carbon stored in soils globally, so destabilization of soil organic matter caused by the warming predicted for tropical regions this century could accelerate climate change by releasing additional carbon dioxide (CO₂) to the atmosphere. Theory predicts that warming should cause only modest carbon loss from tropical soils relative to those at higher latitudes, but there have been no warming experiments in tropical forests to test this.

Here we show that in situ experimental warming of a lowland tropical forest soil on Barro Colorado Island, Panama, caused an unexpectedly large increase in soil CO₂ emissions. Two years of warming of the whole soil profile by four degrees Celsius increased CO₂ emissions by 55 per cent compared to soils at ambient temperature. The additional CO₂ originated from heterotrophic rather than autotrophic sources, and equated to a loss of 8.2 ± 4.2 (one standard error) tonnes of carbon per hectare per year from the breakdown of soil organic matter. During this time, we detected no acclimation of respiration rates, no thermal compensation or change in the temperature sensitivity of enzyme activities, and no change in microbial carbon-use efficiency.

These results demonstrate that soil carbon in tropical forests is highly sensitive to warming, creating a potentially substantial positive feedback to climate change.

(Andrew T. Nottingham *et al*, [[∞]Soil carbon loss by experimental warming in a tropical forest](#), *Nature*, Vol. 584, Pp. 234 - 237, 12 August 2020)

Not only is soil carbon in tropical forests highly sensitive to warming, creating a potentially substantial positive feedback to climate change, the extent of forest area continues to decline throughout the tropics.

Demand for forest products is escalating exponentially with rapidly growing populations and burgeoning growth in 'middle class' lifestyles and demands

around the world. This is resulting in the fragmentation of forests through [resource access and development](#) infrastructures such as [road and rail networks](#) and conversion of ^œ[increasing regions to broadacre farming](#) to feed that growing population. Matthew Hansen *et al* have put it well:

Separating primary forests as a target of fragmentation monitoring is crucial to future conservation efforts. While forests associated with land use exhibit disturbance rates unrelated to fragment size..., primary forests and protected areas have disturbance rates highly correlated with fragment size. Without robust mechanisms to conserve large blocks of extant natural forest, our results indicate a future of ever-increasing fragmentation and loss of primary forests outside of and within protected areas.

(Matthew C. Hansen *et al*, ^œ[The fate of tropical forest fragments](#), *Science Advances*, Vol 6, Issue 11, 11 Mar 2020)

Beatriz Fátima Alves de Oliveira *et al*, describing the impact of savannization of the Amazon Basin on the ^œ[wet-bulb globe temperature heat stress index](#), explained their findings:

...[W]e use a coupled ocean-atmosphere model to assess the impact of savannization of the Amazon Basin on the wet-bulb globe temperature heat stress index under two climate change scenarios (^œ[RCP4.5 and RCP8.5](#)). We find that heat stress exposure due to deforestation was comparable to the effect of climate change under RCP8.5.

Our findings suggest that heat stress index could exceed the human adaptation limit by 2100 under the combined effects of Amazon savannization and climate change. Moreover, we find that risk of heat stress exposure was highest in Northern Brazil and among the most socially vulnerable.

We suggest that by 2100, savannization of the Amazon will lead to more than 11 million people [being] exposed [to] heat stress that poses an extreme risk to human health under a high emission scenario.

(Beatriz Fátima Alves de Oliveira *et al*, ^œ[Deforestation and climate change are projected to increase heat stress risk in the Brazilian Amazon](#), *Communications Earth & Environment* Vol. 2, Article No.: 207, 01 October, 2021)

The fragmentation and exploitation of Amazon rainforests is serious cause for concern. They, along with the Congo Basin and other tropical forest regions, are the already severely damaged lungs of our planet, among other things, breathing in CO₂ and expelling O₂. But, deforestation is happening almost everywhere! Gabriel Popkin has explained:

Farmland is overtaking much of the planet. A new global map assembled from satellite imagery shows that over the past 2 decades, fields of corn, wheat, rice, and other crops have eaten up more than 1 million additional square kilometers of land - roughly twice the area of Spain.

"The inexorable march of the human footprint is just brutal," says study coauthor Matt Hansen, a geographer at the University of Maryland (UMD), College Park.

The food needs of a fast-growing population in Africa are driving some of the expansion. But the study also highlights how Earth's land is becoming, in essence, a unified global farm, with wealthier countries

increasingly outsourcing crop production to poorer regions. Half of the new fields have replaced forests and other natural ecosystems that stored large amounts of carbon, threatening efforts to conserve biodiversity and avert catastrophic climate change.

(Gabriel Popkin, [∞][Satellites document rapid expansion of cropland: Farms added 100 million hectares globally over 2 decades, threatening biodiversity and accelerating climate change, *Science*, 07 January, 2022](#))

Entangled in a crisis which is a direct consequence of deregulated capitalism 🐞

Humanity has found itself entangled in a crisis which is a direct consequence of the nature of deregulated capitalism. Global capitalism demands that all 'natural assets' be transformed into profit making 'resources' and, equally, demands that the environments of all communities be reshaped to enable product, and so profit, maximization. In doing so, human communities everywhere have been disrupted and their inbuilt social and environmental protections dismantled.

The 'needs' of capitalist exploiters have over-ridden those of human society and, in the process, both social and natural environments have been, and still are being, dismantled. Our planet simply cannot afford deregulated capitalism - nor can humanity!

Unless we immediately, and unconditionally, dismantle this preposterous system of exploitation and destruction, the world homo sapiens have lived in for the past ~200,000 years, and we as a species, are enroute to catastrophe.

There are limits to both resource exploitation and atmospheric warming beyond which feedback mechanisms take over, whether resulting from increased CO₂ concentrations or other causes.

We are no longer dealing with future, possible disasters which might result from deregulated capitalism. The disasters are already occurring and will grow worse through this 21st century. They can no longer be 'avoided' by reining in fossil fuel use; by encouraging corporate environmental stewardship; or through 'policymakers and businesspeople including nature's provision of ecosystem services in their national accounting systems and corporate balance sheets'.

Fossil fuel use has, of course, been a major contributor to atmospheric warming. However, in 2020, reining in fossil fuel use will no longer suffice. The planet will continue to warm and greenhouse gases will continue to accumulate in our atmosphere and oceans. Michael Clark *et al* have explained one of the sources of greenhouse gas emissions which will, in concert with other sources of such emissions, result in continued planetary warming:

The goal of the Paris Agreement is to limit average global temperature increases above preindustrial levels to "well below 2°C" and to pursue efforts to "limit increase to 1.5°C." Achieving either goal requires large and rapid reductions in greenhouse gas (GHG) emissions.

To date, most efforts have focused on reducing GHG emissions from fossil fuel combustion in electricity production, transportation, and industry. Renewable energy sources, electric vehicles, improved efficiency, and other innovations and behavioral changes could

eliminate most of these emissions, and carbon capture and sequestration could reduce atmospheric levels of previously emitted carbon.

However, **eliminating all emissions from these sectors may not be sufficient** to meet the 1.5° and 2°C temperature targets. The global food system is also a major source of GHG emissions, emitting ~30% of the global total ...

The global food system generates GHG emissions from multiple sources.

Major sources include land clearing and deforestation, which release carbon dioxide (CO₂) and nitrous oxide (N₂O); production and use of fertilizers and other agrichemicals, which emit CO₂, N₂O, and methane (CH₄); enteric fermentation during the production of ruminants (cows, sheep, and goats), which emits CH₄; production of rice in paddies, which emits CH₄; livestock manure, which emits N₂O and CH₄; and combustion of fossil fuels in food production and supply chains, which emits CO₂.

In total, global food system emissions averaged ~16 billion tonnes (Gt) CO₂ equivalents year⁻¹ from 2012 to 2017

(Michael A. Clark *et al*, [Global food system emissions could preclude achieving the 1.5° and 2°C climate change targets](#), *Science*, Vol. 370, Issue 6517, pp. 705-708, 06 November 2020 (My emphasis))

We have already set the stage for climate driven natural disasters. Atmospheric greenhouse gas concentrations are already at levels which guarantee escalating climate driven catastrophe in the most vulnerable regions of our planet.

How fast are the world's oceans rising? 🌊

Paul Voosen has explained the trajectory of sea-level rise through the past 120 years:

Ask climate scientists how fast the world's oceans are creeping upward, and many will say 3.2 millimeters per year - a figure enshrined in the last Intergovernmental Panel on Climate Change report, from 2014. But the number, based on satellite measurements taken since the early 1990s, is a long-term average. In fact, the global rate varied so much over that period that it was hard to say whether it was holding steady or accelerating.

It was accelerating, big time. Faster melting of Greenland's ice has pushed the rate to 4.8 millimeters per year, according to a 10-year average compiled for *Science* by Benjamin Hamlington, an ocean scientist at NASA's Jet Propulsion Laboratory (JPL) and head of the agency's sea level change team. "The [Greenland] mass loss has clearly kicked into higher gear," agrees Felix Landerer, a JPL sea level scientist. With the help of new data, new models of vertical land motion, and - this month - a new radar satellite, oceanographers are sharpening their picture of how fast, and where, the seas are gobbling up the land.

...[A] group led by Sönke Dangendorf, a physical oceanographer at Old Dominion University, used tide gauge readings that predate satellite records to show seas have risen 20 centimeters since 1900. The team's

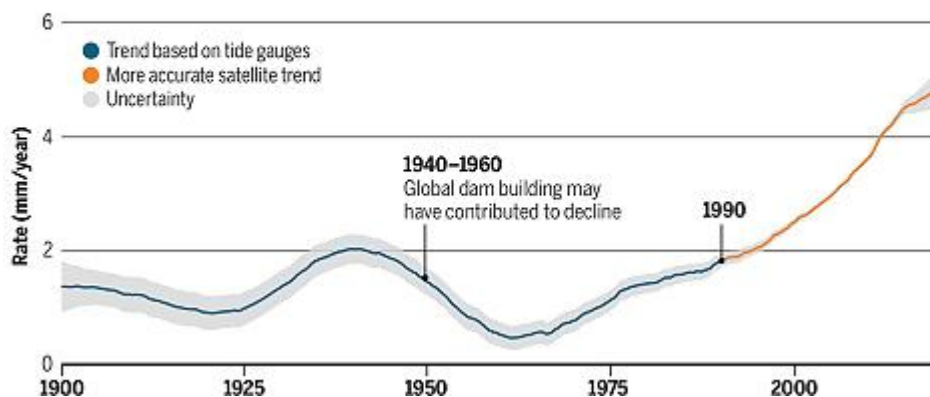

data show that, after a period of global dam building in the 1950s that held back surface water and slowed sea level rise, it began to accelerate in the late 1960s - not the late 1980s, as many climate scientists assumed, Dangendorf says. "That was surprising," because the main drivers of sea level rise - the thermal expansion of ocean water from global warming, together with melting glaciers and ice sheets - were thought to have kicked in later....

The trends are worrisome. Aimée Slangen, a climate scientist at the Royal Netherlands Institute for Sea Research, and colleagues are integrating recent projections from climate models to predict when sea levels will rise 25 centimeters above 2000 levels, a point when 100-year floods on some coastlines could be a near annual occurrence. In unpublished work, Slangen finds that the threshold will be reached sometime between 2040 and 2060. Efforts to slow climate change won't do much to postpone it given the inertia of ocean warming and ice melt, though they could forestall much greater increases later in the century. And that near-term certainty, though dire, is "quite good for decision-making," Slangen says.

Dangendorf, who joined Old Dominion late last year, is getting a front row seat to the action. The university is in Norfolk, Virginia, a part of the U.S. coast where the crust is sinking about as fast as the oceans are rising. "I watch coastal flooding every week," he says. "I see it from my balcony."

High water marks

Sea level rise has been accelerating since the late 1960s. Fueled by meltwater from Greenland, seas are now rising 4.8 millimeters per year and show few signs of slowing down.

Credits: (graphic) Sönke Dangendorf adapted by N. Desai/science; (data) Dangendorf et al., *Nature Climate Change*, 9, 705 (2019); Legeais et al., *Earth System Science Data*, 10, 281 (2018) (edited)
(Paul Voosen, [∞]Seas are rising faster than ever, *Science*, Vol. 370, Issue 6519, pp. 901, 20 Nov 2020)

While rates of sea-level rise over this century remain a subject of debate and dispute among researchers (that's how insight and understanding progress!), there can be little doubt that 'business-as-usual' conditions around the world will result in significant sea-level rise. Martin Siegert *et al* have described the possibilities (they provide footnoted documentation of their projections):

Ice-sheet instability and rapid mass loss

Changes in ice-ocean interactions affecting ice-sheet flow have the greatest potential for causing large, rapid sea-level rise. With both cold air and ocean, ice flowing into the ocean generally forms a floating but

attached ice shelf, calving icebergs from its terminus. Sufficient warming of air or water causes ice-shelf loss, sometimes catastrophically, shifting calving to a non-floating (grounded) ice cliff.

Essentially all ice shelves are restrained by friction, with their sides or local seafloor highs, in turn, restraining the flow of non-floating ice. Ice-shelf reduction or loss speeds flow of that non-floating ice into the ocean, raising sea level.

We focus here on ice-shelf loss and retreat from a topographic bottleneck, two well-known and often-coupled "tipping-point" behaviors that can raise sea level rapidly under strong warming.

Faster flow from thinning of ice shelves caused by warming of ocean or air can lead to fracture along ice-shelf sides and then shelf loss, as occurred at Jakobshavn Glacier in Greenland.

Meltwater ponded in ice-shelf surface crevasses can also accelerate iceberg calving and remove an ice shelf, as happened over a few weeks to the Larsen B ice shelf along the northern Antarctic Peninsula.

Ice shelves appear to be easier to lose than to regrow; despite environmental fluctuations and transient regrowth, persistent ice-shelf regrowth has not yet been observed. Flow acceleration of non-floating ice has followed ice-shelf thinning and loss, together with grounding-zone retreat as nearby non-floating ice thinned to flotation.

For both ice shelves and grounded calving cliffs, the grounding zone can stabilize over long periods at a bottleneck - a seafloor high and/or fjord narrowing - that partially restrains ice flow. Stability is reinforced by several processes, including sediment accumulation. If further retreat is triggered, loss of restraint from the bottleneck favors faster calving, faster ice flow and thinning, typically causing rapid grounding-zone retreat to the next bottleneck.

These retreat processes are well known...

(Martin Siebert *et al*, [Twenty-first century sea-level rise could exceed IPCC projections for strong-warming futures](#), *One Earth*, Volume 3, Issue 6, pp.691-703, December 18, 2020)

Ebru Kirezci *et al*, in a report which 'assembles extensive model and measured datasets at coastlines around the world and combines these to provide projections of global extreme sea level and coastal flooding by 2100' have explained what this will mean for coastal regions:

...[T]here will be an increase of 48% of the world's land area, 52% of the global population and 46% of global assets at risk of flooding by 2100. A total of 68% of the global coastal area flooded will be caused by tide and storm events with 32% due to projected regional sea level rise.

(Ebru Kirezci *et al*, [Projections of global-scale extreme sea levels and resulting episodic coastal flooding over the 21st Century](#), *Scientific Reports* Volume 10, Article number: 11629 (2020))

Somini Sengupta and Julfikar Ali Manik have described the 2020 floods (the fourth in five years) which have inundated as much as a third of Bangladesh:

Torrential rains have submerged at least a quarter of Bangladesh, washing away the few things that count as assets for some of the world's poorest people - their goats and chickens, houses of mud and tin, sacks of rice stored for the lean season.

It is the latest calamity to strike the delta nation of 165 million people. Only two months ago, a cyclone pummeled the country's southwest. Along the coast, a rising sea has swallowed entire villages. And while it's too soon to ascertain what role climate change has played in these latest floods, Bangladesh is already witnessing a pattern of more severe and more frequent river flooding than in the past along the mighty Brahmaputra River, scientists say, and that is projected to worsen in the years ahead as climate change intensifies the rains....

This is one of the most striking inequities of the modern era. Those who are least responsible for polluting Earth's atmosphere are among those most hurt by its consequences. The average American is responsible for 33 times more planet-warming carbon dioxide than the average Bangladeshi.

This chasm has bedeviled diplomacy for a generation, and it is once again in stark relief as the coronavirus pandemic upends the global economy and threatens to push the world's most vulnerable people deeper into ruin.

An estimated 24 to 37 percent of the country's landmass is submerged, according to government estimates and satellite data. By Tuesday, according to the most recent figures available, nearly a million homes were inundated and 4.7 million people were affected. At least 54 have died, most of them children.

The current floods, which are a result of intense rains upstream on the Brahmaputra, could last through the middle of August....

More and worse floods loom.

Even if average global temperature increase modestly - by 2 degrees Celsius over the average for preindustrial times - flooding along the Brahmaputra in Bangladesh is projected to increase by 24 percent. With an increase of 4 degrees Celsius, flooding is projected to increase by over 60 percent.

(Somini Sengupta and Julfikar Ali Manik, ["INEQUITY AT THE BOILING POINT: A Quarter of Bangladesh Is Flooded. Millions Have Lost Everything,"](#) *New York Times*, July 30, 2020)

What about 'ozone collapse'? We are gambling on being able to control the conditions 

The possible consequences of 'business-as-usual' conditions in the 21st century are many and varied - few, if any, to humanity's advantage. We are gambling on being able to control the conditions which are looming on humanity's horizon. Like toddlers playing with fire.

But, there are no adults around who can see the danger and rescue us from the consequences of our ignorant adventurism. We are supposed to be the adults!

Any 'Developed-World' presumption that they will escape the worst consequences of all this is delusional. Approaching the upper threshold of atmospheric warming predicted in current climate models, it is possible that the earth could experience a catastrophic collapse of its ozone layer.

Convective transport of Chlorine Monoxide (which plays a major role in stratospheric ozone depletion) in periods of rapid atmospheric warming weakens ozone layers around the planet. This might well lead to mass

extinction conditions similar to those experienced 359 (and, again, 255) million years ago.

John Marshall, lead author of a study of terrestrial mass extinction at the Devonian-Carboniferous boundary (359 million years ago), explained:

Our ozone shield vanished for a short time in this ancient period, coinciding with a brief and quick warming of the Earth. Our ozone layer is naturally in a state of flux - constantly being created and lost - and we have shown this happened in the past too, without a catalyst such as a continental scale volcanic eruption....

Current estimates suggest we will reach similar global temperatures to those of 360 million years ago, with the possibility that a similar collapse of the ozone layer could occur again, exposing surface and shallow sea life to deadly radiation. This would move us from the current state of climate change, to a climate emergency.

The Research article, entitled 'UV-B radiation was the Devonian-Carboniferous boundary terrestrial extinction kill mechanism', explains:

There is an unexplained terrestrial mass extinction at the Devonian-Carboniferous boundary (359 million years ago). The discovery in east Greenland of malformed land plant spores demonstrates that the extinction was coincident with elevated UV-B radiation demonstrating ozone layer reduction. Mercury data through the extinction level prove that, unlike other mass extinctions, there were no planetary scale volcanic eruptions.

Importantly, the Devonian-Carboniferous boundary terrestrial mass extinction was coincident with a major climatic warming that ended the intense final glacial cycle of the latest Devonian ice age. A mechanism for ozone layer reduction during rapid warming is increased convective transport of ClO [Chlorine Monoxide -a reactive monovalent radical that plays a major role in stratospheric ozone depletion]. Hence, ozone loss during rapid warming is an inherent Earth system process with the unavoidable conclusion that we should be alert for such an eventuality in the future warming world.

(John Marshall *et al*, [UV-B radiation was the Devonian-Carboniferous boundary terrestrial extinction kill mechanism](#), *Science Advances*, 27 May 2020, Vol. 6, no. 22, eaba0768

also: [Study shows erosion of ozone layer responsible for mass extinction event](#), *EurekAlert*, News Release 27 May, 2020)

Feng Liu *et al*, in a study entitled 'Dying in the Sun: Direct evidence for elevated UV-B radiation at the end-Permian mass extinction' (255 million years ago), have provided further cautionary commentary on all this:

...[A] recent "world avoided" modeling experiment... predicted that had the Montreal Protocol not been adopted in 1987, ozone collapse and negative UV-B impacts on plant biomass would have led to a substantial decrease in the size of the terrestrial carbon sink, increasing [atmospheric pCO₂](#) and global temperatures in addition to those forecast for the coming decades.

Modeling of end-Permian ozone depletion scenarios... has predicted similar levels of ozone loss to those recreated in this counterfactual study.... This suggests that the UV-B increase we have evidenced in this study was sufficiently substantial to decrease terrestrial carbon stores and contribute to atmospheric pCO₂ increases and consequent

global warming...

(Feng Liu *et al*, [Dying in the Sun: Direct evidence for elevated UV-B radiation at the end-Permian mass extinction](#), *Science Advances*, Vol 9, Issue 1, 06 January 2023)

What's happening to the world's oceans? 🌊

The increase in atmospheric carbon is a small part of the story. The oceans are being as, or more, strongly affected by increased CO₂ absorption and accompanying development of oxygen free waters. Erin Meyer-Gutbrod *et al* describe the process:

Greenhouse gas emissions have driven global increases in atmospheric and ocean temperatures, which enhance ocean stratification. As the ocean surface layer becomes more buoyant, transport of highly oxygenated surface waters into the ocean interior is reduced.... Increases in seawater temperature also reduce oxygen solubility.... Marked declines in dissolved oxygen (DO) concentrations and shoaling of the oxygen minimum zone (OMZ) have been observed globally since 1960.... These anthropogenic processes are superimposed on natural multidecadal oscillations..., seasonal patterns... and storm impacts... on ocean oxygen content.

The ecological impacts of reduced ocean oxygen concentrations include altered microbial processes and metabolic rates, changes in predator-prey dynamics and lateral and vertical distribution shifts in marine organisms.... Hypoxia disproportionately impacts large taxa, including crustaceans, echinoderms and fish, and is associated with decreased fecundity, habitat reductions and a loss of diversity.

(Erin Meyer-Gutbrod *et al*, [Moving on up: Vertical distribution shifts in rocky reef fish species during climate-driven decline in dissolved oxygen from 1995 to 2009](#), *Global Change Biology*, 16 September 2021 (References deleted))

[Weiqi Yao *et al*](#) explained the inevitable trajectory and consequences:

...[M]easurable oxygen loss from the subarctic North Pacific will occur by 2030-2040 and ... the total volume of suboxic ocean water will expand by 50% by 2100. Once local oxygen concentrations drop below 4 μM, sulfate reduction will commence, resulting in the production of H₂S [hydrogen sulfide], which is toxic at levels as low as 4 μg/l [1 microgram (μg) is equal to 1/1000 milligram (mg) or one millionth (1×10⁻⁶) of a gram; [Molarity \(M\)](#) is defined as the number of moles of a solute in a liter of solution].

Katharina Fabricius *et al* have explained what is happening:

Atmospheric carbon dioxide (CO₂) concentrations are steadily increasing due to human activities, in the present decade at about 2.5 ppm per year. Over a quarter of the rising atmospheric CO₂ is being taken up by the oceans. This lowers the pH and changes the carbon chemistry in surface seawaters, a process called ocean acidification.

Due to human CO₂ emissions, surface seawater pH is now lower than it has been for more than 800,000 years, and the associated chemical changes are considered to be irreversible on centennial to millennial time scales.

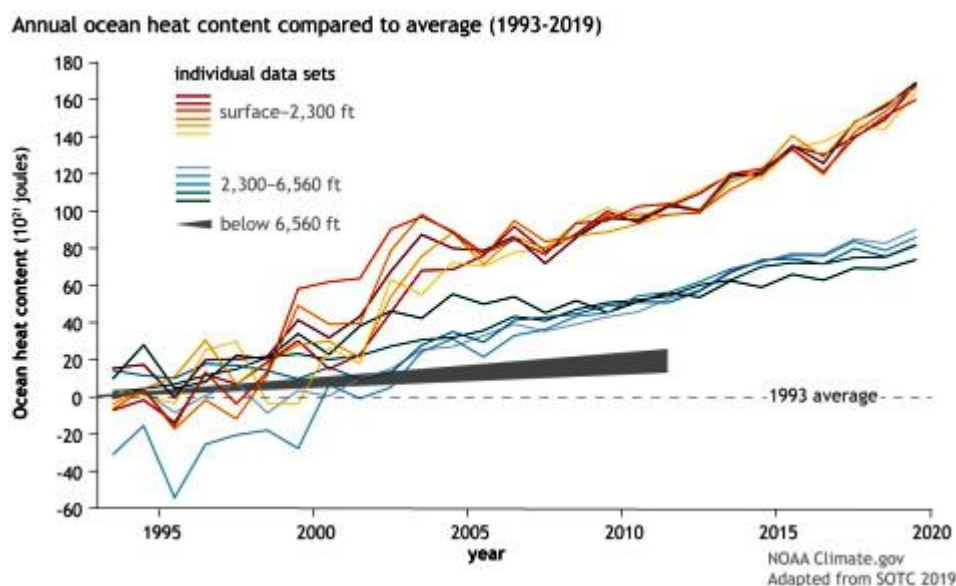

Many studies have shown that ocean acidification, both in isolation and in combination with global warming, causes profound physiological and ecological changes in marine ecosystems, with far more losers than winners. Calcifying marine organisms such as corals and coralline algae are particularly affected, especially during their early life stages, whereas some photosynthetic organisms benefit from the availability of additional inorganic carbon.

Rates of changes in seawater carbon chemistry vary substantially across regions, and depend not only on atmospheric CO₂ concentrations, but also on local physical and biological factors. In coastal, shelf and marginal seas the variation in seawater carbon chemistry is typically much higher than in the open oceans due to regional metabolic processes (photosynthesis/respiration and calcification)....

(Katharina E. Fabricius *et al*, [Progressive seawater acidification on the Great Barrier Reef continental shelf](#), *Scientific Reports* Vol. 10, Article: 1860, 27 October 2020)

Rebecca Lindsey and Luann Dahlman have provided a graphic illustration of what has been happening. As they explain:

More than 90 percent of the warming that has happened on Earth over the past 50 years has occurred in the ocean. Recent studies estimate that warming of the upper oceans accounts for about 63 percent of the total increase in the amount of stored heat in the climate system from 1971 to 2010, and warming from 700 meters down to the ocean floor adds about another 30 percent.

(Rebecca Lindsey and Luann Dahlman, [Climate Change: Ocean Heat Content](#), *Climate.gov*, August 17, 2020)

Lijing Cheng *et al* provide information for 2022:

Changes in ocean heat content (OHC), salinity, and stratification provide critical indicators for changes in Earth's energy and water cycles. These cycles have been profoundly altered due to the emission of greenhouse gasses and other anthropogenic substances by human activities, driving pervasive changes in Earth's climate system.

In 2022, the world's oceans, as given by OHC, were again the hottest in the historical record and exceeded the previous 2021 record maximum. According to IAP/CAS data, the 0-2000 m OHC in 2022

exceeded that of 2021 by 10.9 ± 8.3 ZJ (1 Zetta Joules = 1021 Joules); and according to NCEI/NOAA data, by 9.1 ± 8.7 ZJ.

Among seven regions, four basins (the North Pacific, North Atlantic, the Mediterranean Sea, and southern oceans) recorded their highest OHC since the 1950s. The salinity-contrast index, a quantification of the "salty gets saltier - fresh gets fresher" pattern, also reached its highest level on record in 2022, implying continued amplification of the global hydrological cycle. Regional OHC and salinity changes in 2022 were dominated by a strong La Niña event. Global upper-ocean stratification continued its increasing trend and was among the top seven in 2022. (Lijing Cheng *et al*, ^œ[Another Year of Record Heat for the Oceans](#), *Advances in Atmospheric Sciences*, 11 January 2023)

Daniel Rothman, in a sobering study of changes in the amount of carbon contained in the Earth's oceans, examined 'geologic records and observed that over the last 540 million years, the ocean's store of carbon changed abruptly, then recovered, dozens of times.... This "excitation" of the carbon cycle occurred most dramatically near the time of four of the five great mass extinctions in Earth's history'.⁷⁶⁴

As Rothman has explained,

...Today's oceans are absorbing carbon about an order of magnitude faster than the worst case in the geologic record -- the end-Permian extinction. But humans have only been pumping carbon dioxide into the atmosphere for hundreds of years, versus the tens of thousands of years or more that it took for volcanic eruptions or other disturbances to trigger the great environmental disruptions of the past⁷⁶⁵. Might the modern increase of carbon be too brief to excite a major disruption?

According to Rothman, today we are "at the precipice of excitation," and if it occurs, the resulting spike -- as evidenced through ocean acidification, species die-offs, and more -- is likely to be similar to past global catastrophes.

"Once we're over the threshold, how we got there may not matter," says Rothman, who is publishing his results this week in the ^œ[Proceedings of the National Academy of Sciences](#). "Once you get over it, you're dealing with how the Earth works, and it goes on its own ride."...

In other words, if today's human-induced emissions cross the threshold and continue beyond it, as Rothman predicts they soon will, the consequences may be just as severe as what the Earth experienced during its previous mass extinctions.

"It's difficult to know how things will end up given what's happening today," Rothman says. "But we're probably close to a critical threshold. Any spike would reach its maximum after about 10,000 years. Hopefully that would give us time to find a solution."

(*EurekaAlert*, ^œ[Breaching a 'carbon threshold' could lead to mass extinction: Carbon dioxide emissions may trigger a reflex in the carbon cycle, with devastating consequences, study finds](#), *Massachusetts Institute of Technology EurekaAlert* News Release 8-Jul-2019)

Nicole Lovenduski, co-author of a ^œ[climate model for predicting the acceleration or slowdown of ocean acidification](#), has spelt out one of the oceanic consequences of the absorption of CO₂:

"The ocean has been doing us a huge favor," said study co-author Nicole Lovenduski, associate professor in atmospheric and oceanic sciences and head of the Ocean Biogeochemistry Research Group at INSTAAR [the Institute of Arctic and Alpine Research].

The ocean absorbs a large fraction of the excess carbon dioxide in the Earth's atmosphere derived from human activity. Unfortunately, as a result of absorbing this extra man-made carbon dioxide - 24 million tons every single day - the oceans have become more acidic. "Ocean acidification is proceeding at a rate 10 times faster today than any time in the last 55 million years," said Lovenduski.

Within decades, scientists are expecting parts of the ocean to become completely corrosive for certain organisms, which means they cannot form or maintain their shells.

(Kelsey Simpkins, ^œ[Ocean acidification prediction now possible years in advance](#), *CU Boulder Today*, May 1, 2020)

Andrew Watson *et al*, in a research report entitled '^œ[Revised estimates of ocean-atmosphere CO₂ flux are consistent with ocean carbon inventory](#)' (*Nature Communications*, Vol.11, No. 4422, 04 September 2020), show that current estimates of CO₂ absorption by the earth's oceans *significantly underestimate* the rate of absorption, and, consequently, the rate of ^œ[ocean acidification](#).

[An unprecedented planet-wide experiment](#) 🐉

Global capitalists have embarked on an unprecedented planet-wide experiment. They have myopically reshaped the world to their 'needs', driven, not by a clear understanding of the environmental implications of their behavior, but by the 'bottom line' ⁷⁶⁶. As [William Booth explained](#) of 19th century capitalism:

Men go into banking and other businesses for the sake of obtaining what the American humorist said was the chief end of man in these modern times, namely, "ten per cent." To obtain a ten per cent. what will not men do? They will penetrate the bowels of the earth, explore the depths of the sea, ascend the snow-capped mountain's highest peak, or navigate the air, if they can be guaranteed a ten per cent.

In the process, they have destabilized the climate of the Holocene, the period reaching more than 10,000 years before the Industrial Revolution.

But, of course, capitalism's greatest fear is not increasingly erratic climatic conditions or 'global warming'. Those are simply (possibly conspiratory) nuisances which interfere with the pursuit of wealth. The real fear is that one day, the source of capitalism's wealth - the stores of carbon-based energy which have driven capitalist 'development' for three centuries - will become depleted! What will they do if/when those stores of energy run out?

According to the U.S. Secretary of the Interior, Ryan Zinke in 2018, that day had just receded into the remote future - certainly into a future beyond the life-spans of those who drive Capitalism's pursuit of 'wealth'! A 2018 ^œ[U.S. Geological Survey report](#) explained:

Using a geology-based assessment methodology, ...undiscovered, technically recoverable continuous mean resources of 46.3 billion barrels of oil and 281 trillion cubic feet of gas [have been found] in the Wolfcamp shale and Bone Spring Formation of the Delaware Basin in the Permian Basin Province, southeast New Mexico and west Texas.

Zinke provided an adulatory assessment of what this means:

Christmas came a few weeks early this year,... American strength flows from American energy, and as it turns out, we have a lot of American energy. Before this assessment came down, I was bullish on oil and gas production in the United States. Now, I know for a fact that American energy dominance is within our grasp as a nation.

Dr. Jim Reilly, USGS Director, elaborated:

In the 1980's, during my time in the petroleum industry, the Permian and similar mature basins were not considered viable for producing large new recoverable resources. Today, thanks to advances in technology, the Permian Basin continues to impress in terms of resource potential. The results of this most recent assessment and that of the Wolfcamp Formation in the Midland Basin in 2016 are our largest continuous oil and gas assessments ever released,... Knowing where these resources are located and how much exists is crucial to ensuring both our energy independence and energy dominance.

(^œ[USGS identifies largest continuous oil and gas resource potential ever](#), *EurekAlert*, 6 December, 2018)

Worldwide resource extraction and use over the past fifty years and more have responded to the demands of both 'developing' and 'developed' nations⁷⁶⁷ for [resources to feed their burgeoning industrial economies](#). As a *World Politics Review* summary explained:

Despite concerns over the environmental impact of industrial mining and the contribution that fossil fuels make to global warming, resource extraction continues to be a major source of revenue for both developing countries and wealthier nations alike. In fact, the amount of resources being pulled from the earth has tripled since 1970, though the global population has only doubled in that time.

Amid global efforts to reduce carbon emissions as part of climate change diplomacy, fossil fuels remained among the most prized extractives, for a simple reason: Global demand combined with the wealth they generate have historically given some countries, including members of the Organization of the Petroleum Exporting Countries, outsized global influence.

The lucrative contracts associated with the extractive sector help to explain why resource extraction remains central to many developing countries' strategy to grow their economies....
(^œ[The Double-Edged Sword of Oil, Energy and Mining in International Politics](#), *World Politics Review*, July 22, 2020)

In 2021 the problem remains. How do nations, dependent on fossil fuels to keep their economies 'growing', address the greenhouse gas consequences of burning fossil fuels? Lisa Friedman explained:

Mr. Biden "can't afford to take a pure position on the climate" because he lacks strong majorities in Congress, said William A. Galston, a senior fellow in governance studies at the Brookings Institution, a Washington think tank. "That is the backdrop against which this president and the administration will be making trade-offs on every single issue."

So,

Despite President Biden's pledge to aggressively cut the pollution from fossil fuels that is driving climate change, his administration has quietly taken actions this month that will guarantee the drilling and burning of oil and gas for decades to come.

The clash between Mr. Biden's pledges and some of his recent decisions illustrates the political, technical and legal difficulties of disentangling the country from the oil, gas and coal that have underpinned its economy for more than a century.

On Wednesday, the Biden administration defended in federal court the Willow project, a huge oil drilling operation proposed on Alaska's North Slope that was approved by the Trump administration and is being fought by environmentalists. Weeks earlier, it backed former President Donald J. Trump's decision to grant oil and gas leases on federal land in Wyoming. Also this month, it declined to act when it had an opportunity to stop crude oil from continuing to flow through the bitterly contested, 2,700-mile Dakota Access pipeline, which lacks a federal permit.

(Lisa Friedman, ["Biden's Fossil Fuel Moves Clash With Pledges on Climate Change,"](#) *New YorkTimes*, 28 May, 2021)

In any conflict between short-term economic wellbeing and serious action to address a longer-term (but not much longer!) climate catastrophe, industrial nations, taking their lead from the US, will opt for short-term economic 'growth'.

This is Western capitalist madness⁷⁶⁸.

The last thing the world needs at the start of the 21st century is a vast new source of fossil fuels!⁷⁶⁹

Daniel Sigman has explained:

Most scientists agree that the Holocene's warmth was critical to the development of human civilization. The Holocene was an "interglacial period," one of the rare intervals of warm climate that have occurred over the ice age cycles of the last million years. The retreat of the glaciers opened a more expansive landscape for humans, and the higher concentrations of carbon dioxide in the atmosphere made for more productive agriculture, which allowed people to reduce their hunter-gathering activities and build permanent settlements.

The Holocene differed from other interglacial periods in several key ways... For one, its climate was unusually stable, without the major cooling trend that is typical of the other interglacials. Secondly, the concentration of carbon dioxide in the atmosphere rose about 20 parts per million (ppm), from 260 ppm in the early Holocene to 280 ppm in the late Holocene, whereas carbon dioxide was typically stable or declined over other interglacial periods.

For comparison, since the beginning of industrialization until now, the carbon dioxide concentration in the atmosphere has increased from 280 to more than 400 ppm as a consequence of burning fossil fuels.

(["Carbon 'leak' may have warmed the planet for 11,000 years, encouraging human civilization,"](#) *EurekAlert*, 30 July, 2018)

(Studer, Anja S., Sigman, Daniel M. *et al*, ["Increased nutrient supply to the Southern Ocean during the Holocene and its implications for the pre-industrial atmospheric CO₂ rise,"](#) *Nature Geoscience*, 30 July, 2018)

David Naafs has described the new trajectory:

... [U]nless we mitigate current levels of carbon dioxide emissions, [the world] could revert to the hot tropical climate of the early Paleogene period - 56-48 million years ago....

(^œEver-increasing CO₂ levels could take us back to the tropical climate of Paleogene period, *EurekAlert*, 30 July, 2018)

(B. D. A. Naafs, M. Rohrsen *et al*, ^œHigh temperatures in the terrestrial mid-latitudes during the early Palaeogene, *Nature Geoscience*, 30 July, 2018)

It is, I promise, worse than you think! We may see PETM-magnitude extinction and accelerated evolution in as few as 140 years 🐦

 (30/03/23) (04/08/23)

There is a possibility, explained by Christian Berndt *et al*⁷⁷⁰, that rapid geological venting (over ~200,000 years) of greenhouse gasses preceding a major extinction event 56 million years before the present (Ma). provides an imperfect but credible analog to the rapid venting of greenhouse gasses in the early 21st century.

The major difference, of course, and one that makes such an analog imperfect at best, is that whereas the geological venting preceding the Paleocene-Eocene thermal maximum (PETM) **occurred over 200,000 years**, similar venting in the present **results from human activity over the past 200 years**. Nobody knows, and the geological record simply does not provide a true analog of, what might result from our apocalyptic dicing with disaster.

Looming catastrophe might, indeed, arrive much sooner than we presumptuously believe!

Philip Gingerich has provided a time frame for such an occurrence: 'If the present trend of increasing carbon emissions continues, we may see PETM-magnitude extinction and accelerated evolution in as few as 140 years or about five human generations':

The Paleocene-Eocene thermal maximum (PETM) was caused by a massive release of carbon to the atmosphere. This is a benchmark global greenhouse warming event that raised temperatures to their warmest since extinction of the dinosaurs. Rates of carbon emission today can be compared to those during onset of the PETM in two ways:

- (1) projection of long-term PETM rates for comparison on an annual time scale; and
- (2) projection of shortterm modern rates for comparison on a PETM time scale.

Both require temporal scaling and extrapolation for comparison on the same time scale. PETM rates are few and projection to a short time scale is poorly constrained. Modern rates are many and projection to a longer PETM time scale is tightly constrained - modern rates are some 9-10 times higher than those during onset of the PETM.

If the present trend of anthropogenic emissions continues, we can expect to reach a PETM-scale accumulation of atmospheric carbon in as few as 140 to 259 years (about 5 to 10 human generations).

(Philip D. Gingerich, ^œ[Temporal Scaling of Carbon Emission and Accumulation Rates: Modern Anthropogenic Emissions Compared to Estimates of PETM-Onset Accumulation](#), *Paleoceanography and Paleoclimatology*, Volume 34, Issue 1, 30 January 2019)

It seems that, as the planet warms, it becomes more sensitive to CO₂ forcing (the difference between insolation (sunlight) absorbed by the Earth and energy radiated back to space). As Anagnostou *et al*, in an examination of climate sensitivity in the Eocene greenhouse (around 55-56 million years ago⁷⁷¹) conclude:

Our reconstructions, while still underlining the importance of CO₂ in driving the evolution of Eocene climate, provide evidence of strong non-linearities between climate and CO₂ forcing, likely related to both cloud feedbacks for the early-mid Eocene, and changing paleogeography and ice sheets for the late Eocene. This reveals climate-state dependent feedbacks and elevated ECS [Equilibrium Climate Sensitivity] operated during the warmest climates of the last 65 million years.

Their summary of their research and findings:

Despite recent advances, the link between the evolution of atmospheric CO₂ and climate during the Eocene greenhouse remains uncertain. In particular, modelling studies suggest that in order to achieve the global warmth that characterised the early Eocene, warmer climates must be more sensitive to CO₂ forcing than colder climates.

Here, we test this assertion in the geological record by combining a new high-resolution boron isotope-based CO₂ record with novel estimates of Global Mean Temperature. We find that Equilibrium Climate Sensitivity (ECS) was indeed higher during the warmest intervals of the Eocene, agreeing well with recent model simulations, and declined through the Eocene as global climate cooled. These observations indicate that the canonical IPCC range of ECS (1.5 to 4.5 °C per doubling) is unlikely to be appropriate for high-CO₂ warm climates of the past, and the state dependency of ECS may play an increasingly important role in determining the state of future climate as the Earth continues to warm.

(E. Anagnostou *et al*, [Proxy evidence for state-dependence of climate sensitivity in the Eocene greenhouse](#), *Nature Communications* Vol.11, Article No. 4436, 07 September 2020)

Capitalism has, indeed, set the planet on course for escalating disaster over the next century.

Since the start of this century, here is where we are heading: don't allow anyone to tell you that this is just a 'once in a century period' in California (or in Eastern Australia; or in (fill in your area here!)). In 2019 the *New York Times* maintained a minute by minute update of fire conditions in California (the situation in 2020 has been equally serious with [more than 2 million acres burned](#): *17 of the 20 most destructive wildfires in Californian history have occurred since 2003*):

Right Now Firefighters are continuing to battle fires up and down California, including several that began overnight.

Here's what you need to know:

- Evacuations were ordered in San Bernardino.
- In Jurupa Valley, strong winds are feeding the flames.
- Firefighters battling the Kincadee fire are optimistic.
- Goats may have helped save the Reagan Presidential Library.

- Some Sonoma County residents returned home.
- Maps show where the fires are burning now.
- Santa Ana winds drive flames and imperil crews.

(*New York Times*, ^œ[California Fires Live Updates: Homes Burn in San Bernardino: A new blaze known as the Hillside fire forced residents to flee as strong winds drove the flames](#), October 31, 2019 (Updated 9:55 p.m. ET))

Bill McKibben has posed the question for California (increasingly being asked in response to such conditions around the world):^œ[Has the climate crisis made California too dangerous to live in? As with so many things, Californians are going first where the rest of us will follow](#) (*The Guardian*, October 29, 2019)

Of course, California is not the only state being ravaged by wildfires. Bill Morlin and Mike Baker have described the September 2020 experiences of other Western Seaboard US states:

The wildfire arrived with such ferocity that deputies drove through the streets of Malden, Wash., screaming for people to leave. By the time the blaze passed, not even the fire station was spared - the town's only fire truck was still trapped inside, turned into an ashen hulk.

The devastation in Washington State was repeated up and down the parched West Coast on Wednesday as a wildfire season of unrivaled destruction continued to spread, destroying not only much of Malden but several other communities in the Northwest, while belching enough smoke to blot out the sun in San Francisco. At least six people were killed in the recent blazes.

In California, fires have now charred some 2.5 million acres - a modern record and nearly 20 times what had burned at this time last year. In Washington, a wildfire pushed into suburban communities near Tacoma. And in Oregon, officials said hundreds and perhaps more than a thousand homes had already been destroyed....

(Bill Morlin and Mike Baker, ^œ[Wildfires Bring New Devastation Across the West](#), *New York Times*, September 9, 2020)

As David Wallace-Wells has said:

It is, I promise, worse than you think. If your anxiety about global warming is dominated by fears of sea-level rise, you are barely scratching the surface of what terrors are possible, even within the lifetime of a teenager today. And yet the swelling seas - and the cities they will drown - have so dominated the picture of global warming, and so overwhelmed our capacity for climate panic, that they have occluded our perception of other threats, many much closer at hand. Rising oceans are bad, in fact very bad; but fleeing the coastline will not be enough.

Indeed, absent a significant adjustment to how billions of humans conduct their lives, parts of the Earth will likely become close to uninhabitable, and other parts horrifically inhospitable, as soon as the end of this century.

(David Wallace-Wells, ^œ[The Uninhabitable Earth](#), *New York Magazine*, July, 2017)

As the 21st century unfolds, we are already experiencing the consequences: Yet we continue with our [absurd great power rivalries](#).

Capitalist nations have been relatively adept at formulating national greenhouse-gas-emissions reduction 'plans'. They have proved equally adept at finding ways of minimizing the impact of such reductions on their own economies and lifestyles. Over the past half-century many of their most [polluting industries have been offshored](#) to East-Asian nations along with their labor-intensive industries. ⁷⁷²

Those Asian nations, in turn, have often found ways of similarly shifting responsibility for pollution to others. Bashir, Niazi and Watto, have described the process:

After remaining flat from 2014 to 2016, global greenhouse gas emissions in 2017 increased to a record high. One contributing factor is foreign investments in coal. Many countries are working to reduce their carbon footprints within their borders, but adding to emissions by investing in coal-based power projects elsewhere in the world.

According to the Natural Resources Defense Council (NRDC), between 2007 and 2015, G20 countries financed US\$76 billion worth of overseas coal projects. China, Japan, Germany, and South Korea were responsible for US\$62 billion of the total. ⁷⁷³

After the 2015 UN Climate Change Conference (COP21), China, along with other nations, committed to cut greenhouse gas emissions. As promised, China has taken steps to substantially reduce coal use over the past few years. However, China's government has continued to finance coal-based power projects beyond its borders, especially in countries where environmental regulations and laws are weak.

In 2016 alone, China financed coal projects worth US\$6.3 billion in Egypt, Bangladesh, Pakistan, and Indonesia. In Pakistan, China plans to install coal-based power plants with a capacity of at least 7800 MW as part of the China-Pakistan Economic Corridor (CPEC) project. This investment includes excavation of coal-lignite from the Thar Desert of Pakistan. Coal-lignite emits about 1100 grams CO₂ per kilowatt-hour, compared with natural gas, which emits 150 to 430 grams per kilowatt-hour...

The costs and consequences of such coal-based projects can stretch over decades, and they can trap developing nations in a system of carbon-intensive energy use....

(Safdar Bashir, Nabeel Khan Niazi, Muhammad Arif Watto, ^œ[Injustices of foreign investment in coal](#), *Science* 08 Jun 2018: Vol. 360, Issue 6393, pp. 1081)

Paul Voosen has described conditions 'Some 125,000 years ago, during the last brief warm period between ice ages':

Earth was awash. Temperatures during this time, called the Eemian, were barely higher than in today's greenhouse-warmed world. Yet proxy records show sea levels were 6 to 9 meters higher than they are today, drowning huge swaths of what is now dry land.

Scientists have now identified the source of all that water: a collapse of the West Antarctic Ice Sheet. Glaciologists worry about the present-day stability of this formidable ice mass. Its base lies below sea level, at risk of being undermined by warming ocean waters, and glaciers fringing it are retreating fast. The discovery, teased out of a sediment core and reported last week at a meeting of the American Geophysical Union in Washington, D.C., validates those concerns, providing

evidence that the ice sheet disappeared in the recent geological past under climate conditions similar to today's. "We had an absence of evidence," says Anders Carlson, a glacial geologist at Oregon State University in Corvallis, who led the work. "I think we have evidence of absence now."

If it holds up, the finding would confirm that "the West Antarctic Ice Sheet might not need a huge nudge to budge," says Jeremy Shakun, a paleoclimatologist at Boston College. That, in turn, suggests "the big uptick in mass loss observed there in the past decade or two is perhaps the start of that process rather than a short-term blip."

(Paul Voosen, ^œ[Antarctic ice melt 125,000 years ago offers warning: Ice sheet apparently collapsed in a previous warm period](#), *Science*, 21 Dec 2018: Vol. 362, Issue 6421, pp. 1339)

Lijing Cheng and co-authors explain why we need not look far for the source of the necessary 'nudge to budge' the West Antarctic Ice Sheet. We might feel that the climate is warming (the 20 warmest years have all occurred in the past 22 years and the last 5 years have been the warmest on record), but, as Cheng *et al* explain, 93% of the heat trapped in a warming earth has gone, not into the atmosphere around us, but into the deep oceans⁷⁷⁴ - into the very regions which will provide the necessary nudge to destabilize the West Antarctic Ice Sheet (WAIS) (and, of course, the necessary heat to [destabilize methane clathrates](#)⁷⁷⁵).

Climate change from human activities mainly results from the energy imbalance in Earth's climate system caused by rising concentrations of heat-trapping gases. About 93% of the energy imbalance accumulates in the ocean as increased ocean heat content (OHC). The ocean record of this imbalance is much less affected by internal variability and is thus better suited for detecting and attributing human influences than more commonly used surface temperature records. Recent observation-based estimates show rapid warming of Earth's oceans over the past few decades...

Although climate model results (see the supplementary materials) have been criticized during debates about a "hiatus" or "slowdown" of global mean surface temperature, it is increasingly clear that the pause in surface warming was at least in part due to the redistribution of heat within the climate system from Earth surface into the ocean interiors

...

(Lijing Cheng, John Abraham, Zeke Hausfather, Kevin E. Trenberth, ^œ[How fast are the oceans warming?](#), *Science* 11 Jan 2019: Vol. 363, Issue 6423, pp. 128-129)

Matthis Auger *et al* have documented long-term Southern Ocean temperature changes and warming of subsurface subpolar deep waters. As they conclude:

Our 25-year study confirms two major threats (significant warming and shoaling of Upper Circumpolar Deep Water) that may enhance the ice-shelf melting downstream, with potential dramatic impacts for future global sea-level. Both of these changes that we observed at 140°E have been substantially underestimated in this part of the Southern Ocean until now and must imperatively be taken into account in future ice-sheet modeling predictions, and more generally when developing future climate change narratives.

(Matthis Auger *et al*, ^œ[Southern Ocean in-situ temperature trends over](#)

[25 years emerge from interannual variability](#), *Nature Communications*, 12, 514, 21 January, 2021)

And, in 2023, Qian Li *et al* have found that:

...under a high-emissions scenario, abyssal warming is set to accelerate over the next 30 years.

A *Eureka!* alert explanation provided further information:

About 250 trillion tonnes of cold, salty, oxygen-rich water sinks near Antarctica each year. This water then spreads northwards and carries oxygen into the deep Indian, Pacific and Atlantic Oceans.

"If the oceans had lungs, this would be one of them," Prof England says.

The international team of scientists modelled the amount of Antarctic deep water produced under the IPCC 'high emissions scenario', until 2050.

The model captures detail of the ocean processes that previous models haven't been able to, including how predictions for meltwater from ice might influence the circulation.

This deep ocean current has remained in a relatively stable state for thousands of years, but with increasing greenhouse gas emissions, Antarctic overturning is predicted to slow down significantly over the next few decades....

With a collapse of this deep ocean current, the oceans below 4000 metres would stagnate.

"This would trap nutrients in the deep ocean, reducing the nutrients available to support marine life near the ocean surface," says Prof England.

Co-author Dr Steve Rintoul of CSIRO and the Australian Antarctic Program Partnership says the model simulations show a slowing of the overturning, which then leads to rapid warming of the deep ocean.

"Direct measurements confirm that warming of the deep ocean is indeed already underway," says Dr Rintoul.

The study found melting ice around Antarctica makes the nearby ocean waters less dense, which slows the Antarctic overturning circulation.

The melt of the Antarctic and Greenland ice sheets is expected to continue to accelerate as the planet warms.

(Qian Li *et al*, [[∞]Abyssal ocean overturning slowdown and warming driven by Antarctic meltwater](#), *Nature* vol. 615, pp. 841-847, 29 March 2023 and

[[∞]Deep ocean currents around Antarctica headed for collapse, study finds](#), *University of New South Wales*, 29 March 2023)

We are witnessing the inevitable consequence of our inability to rein in the climate impacting pollution resulting from our apparently insatiable appetites for more and more generated energy and concomitant production, consumption and casual disposal of the resulting 'wastes'. Sebastian Rosier *et al* have described the impending mass loss of the Pine Island and Thwaites glaciers that could initiate a collapse of the West Antarctic Ice Sheet.

As Hilmar Gudmundsson (one of the co-authors) explained, 'should the glacier enter unstable irreversible retreat, the impact on sea level could be

measured in meters, and as this study shows, once the retreat starts it might be impossible to halt it':

While the possibility of PIG [Pine Island Glacier] undergoing unstable retreat has been raised and discussed previously, this is to our knowledge the first time the stability regime of PIG has been mapped out in this fashion.

The first and second tipping events are relatively small and could be missed without careful analysis of model results but nevertheless are important in that they lead to considerable sea-level rise and would require a large reversal in ocean conditions for recovery.

The third and final tipping point is crossed with an increase in sub-shelf melt rates equivalent to a +1.2 °C increase in ocean temperatures from initial conditions and leads to a complete collapse of PIG.

Long-term warming and shoaling trends in Circumpolar Deep Water..., in combination with changing wind patterns in the Amundsen Sea..., can expose the PIG ice shelf to warmer waters for longer periods of time and make temperature changes of this magnitude increasingly likely.

(Sebastian H. R. Rosier *et al*, [The tipping points and early warning indicators for Pine Island Glacier, West Antarctica](#), *The Cryosphere*, Volume 15, issue 3, TC, 15, 1501-1516, March 25, 2021)

Wâhlin *et al* have further elaborated:

Deep water underneath the central ice shelf derives from a previously underestimated eastern branch of warm water entering the cavity from Pine Island Bay. Inflow of warm and outflow of melt-enriched waters are identified in two seafloor troughs to the north. Spatial property gradients highlight a previously unknown convergence zone in one trough, where different water masses meet and mix. Our observations show warm water impinging from all sides on pinning points critical to ice-shelf stability, a scenario that may lead to unpinning and retreat....

This pinning point is one of the last buttressing features restraining the flow of ice from upstream...

(A. K. Wâhlin *et al*, [Pathways and modification of warm water flowing beneath Thwaites Ice Shelf, West Antarctica](#), *Science Advances* Vol. 7, no. 15, 09 Apr 2021)

Ian Joughin *et al* have provided further explanation of the ongoing speedup of Pine Island Glacier:

In the decades since it and neighboring Thwaites Glacier were called "the weak underbelly of the West Antarctic Ice Sheet," ... Pine Island Glacier ... has sped up in fits and starts ... as its grounding line retreated (7). In 2009, speeds peaked at ~4000 m/year near the grounding line (where grounded ice first goes afloat) and remained fairly stable over the following 8 years. Several modeling studies have shown that past speedups were due to melt-driven thinning concentrated near the grounding line and the resulting loss of basal traction as the grounding line retreated ..., with ice shelf calving only having a minor influence on ice discharge across the grounding line As a result of these speedups, PIG is responsible for more than a quarter of Antarctica's total sea-level contribution over the past few decades

Beginning in 2015, the Copernicus Sentinel 1A/B synthetic aperture radar (SAR) satellites began collecting data every 12 (before fall 2016) and 6 days (fall 2016 to present) over PIG and much of its catchment. Here, we use these data to investigate changes in PIG's flow speed as its ice shelf retreated by nearly 20 km since late 2017. While most of the past speedup was due to processes concentrated at the grounding line, earlier work has shown that partial loss of the outer shelf also can cause speedup of the grounded ice ... Thus, we analyze changes in flow speed and geometry using an ice-flow model to investigate the cause of the recent speedup..

... Tthe long-term stability of PIG appears to depend heavily on how calving rates affect the viability of its remaining ice shelf ... A stabilization of the ice front near its current position is possible, but so is a retreat far more rapid than expected from ocean- and surface melt-related processes alone. The extent to which these rifting processes might influence other ice shelves remains unclear, leading to increased grounded-ice discharge.

(Ian Joughin *et al*, [Ice-shelf retreat drives recent Pine Island Glacier speedup](#), *Science Advances*, Vol. 7, no. 24, 11 June 2021) (References deleted)

In this 21st century the effect of Southern Ocean warming on the Antarctic region is, indeed, cause for concern. Maurice Huguenin *et al* have summed up the consequences of ocean heat uptake (OHU) for the Southern Ocean and for Antarctica.

Wind and thermodynamic changes each explain ~ 50% of global OHU, while Southern Ocean forcing trends can account for almost all of the global OHU....

Heat uptake in the Indian and Pacific subtropical and tropical basins plays only a minor role on the global scale.... This is likely because the Indian and Pacific basins lack a convection-driven deep circulation... that would efficiently take up heat over multi-decadal time scales. In addition, heat uptake in the tropics is inhibited by the warming response of the SST [sea surface temperatures].... In contrast, at the high latitudes of the Southern Ocean, the SST increases at a rate that keeps pace with local atmospheric warming (due to wind-driven Ekman effects) creating favourable conditions for continuous ocean heat uptake...

In summary, our experiments emphasise that recent trends in Southern Ocean surface winds, surface air temperature and radiation have driven almost all of the globally integrated ocean warming of the past half century...

(Maurice F. Huguenin *et al*, [Drivers and distribution of global ocean heat uptake over the last half century](#), *Nature Communications* Vol. 13, Article No. 4921, 07 September 2022)

Shijian Hu and co-authors, in an analysis of a deep-reaching acceleration of global mean ocean circulation over the past two decades, provide clear evidence that there has, since the 1990s, been an acceleration of global ocean circulation that extends into the deep oceans on a planetary scale. As they summarize:

...The increasing trend in kinetic energy is particularly prominent in the global tropical oceans, reaching depths of thousands of meters. The deep-reaching acceleration of the ocean circulation is mainly induced

by a planetary intensification of surface winds since the early 1990s. Although possibly influenced by wind changes associated with the onset of a negative Pacific decadal oscillation since the late 1990s, the recent acceleration is far larger than that associated with natural variability, suggesting that it is principally part of a long-term trend. (Shijian Hu *et al*, [∞][Deep-reaching acceleration of global mean ocean circulation over the past two decades](#), *Science Advances*,:Vol. 6, no. 6, 05 February 2020)

With an acceleration of global mean ocean circulation at depth, ocean heat content is being increasingly diffused through those depths. In a paper entitled 'Upper Ocean Temperatures Hit Record High in 2020', Lijing Cheng *et al* provide an excellent graphic of global Ocean Heat Content (OHC) acceleration between 1958 and 2020. As they explain,

Since 1986, the average annual increase is $9.1 \pm 0.3 \text{ ZJ [zeta (10}^{21}\text{) joules] yr}^{-1}$ (1986 to 2020), almost eight times larger than the linear rate from 1958~1985 ($1.2 \pm 0.6 \text{ ZJ yr}^{-1}$). Further, the uncertainty has decreased as improved instruments... and analysis methods have become available.... Moreover, each decade has been warmer than its preceding decade.

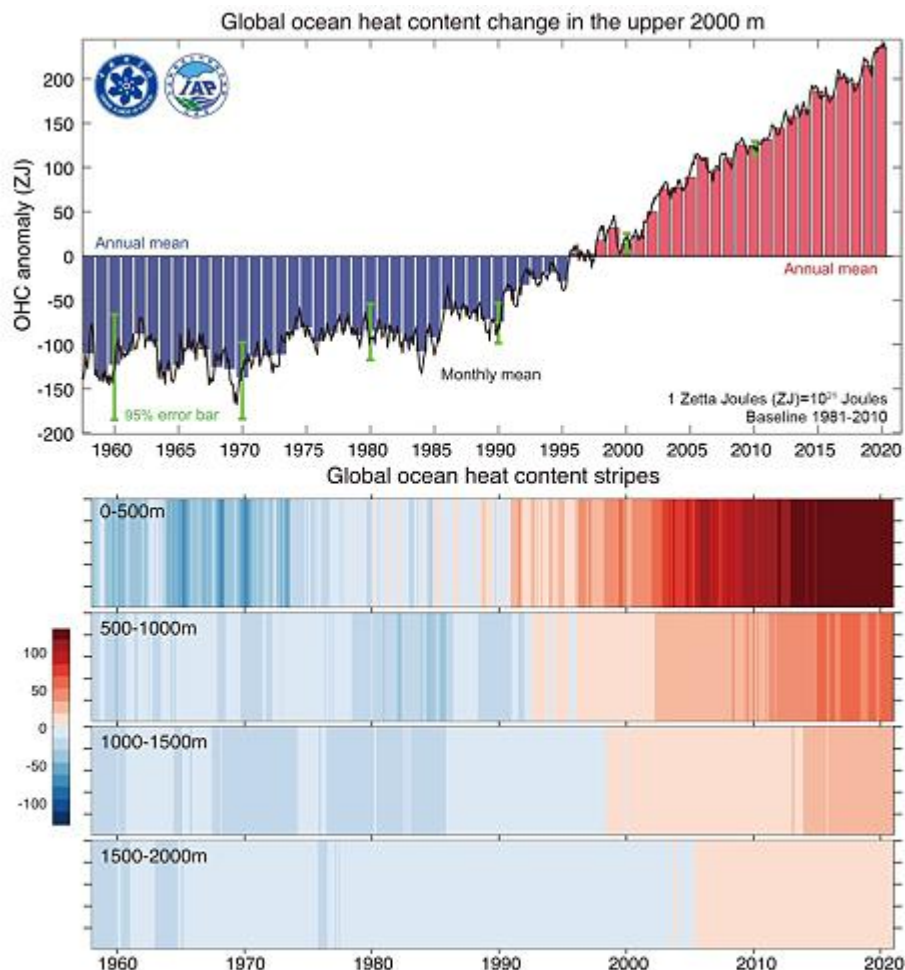

Fig. 1. (Upper) Global upper 2000 m OHC from 1958 through 2020. The histogram presents annual anomalies relative to a 1981–2010 baseline, with positive anomalies shown as red bars and negative anomalies as blue. (Bottom) Global 0–500 m, 500–1000 m, 1000–1500 m, and 1500–2000 m OHC stripes from 1958 to 2020. Units: ZJ.

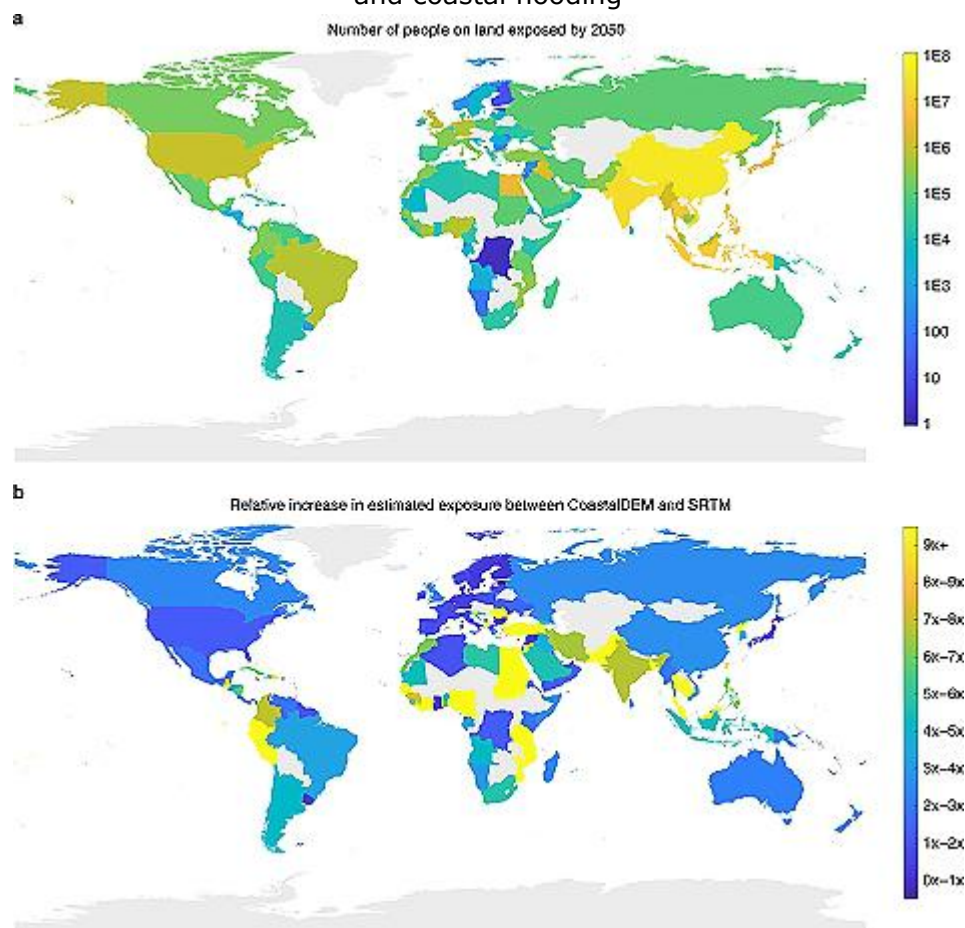

(Lijing Cheng *et al*, [∞][Upper Ocean Temperatures Hit Record High in 2020](#), *Advances in Atmospheric Sciences*,, 13 January 2021)

As the aphorism says, "By all means hope for the best, but always plan for the worst"! What looks like centimeters now, might all-too-soon become meters!

Scott Kulp and Benjamin Strauss, in an abstract of a study in *Nature Communications*, have elaborated:

Most estimates of global mean sea-level rise this century fall below 2m. This quantity is comparable to the positive vertical bias of the principle digital elevation model (DEM) used to assess global and national population exposures to extreme coastal water levels, NASA's SRTM [^œ[Shuttle Radar Topography Mission](#)]. CoastalDEM is a new DEM utilizing neural networks to reduce SRTM error. Here we show - employing CoastalDEM - that 190 M people (150-250 M, 90% CI) currently occupy global land below projected high tide lines for 2100 under low carbon emissions, up from 110 M today, for a median increase of 80 M. These figures triple SRTM-based values. Under high emissions, CoastalDEM indicates up to 630 M people live on land below projected annual flood levels for 2100, and up to 340 M for mid-century, versus roughly 250 M at present. We estimate one billion people now occupy land less than 10 m above current high tide lines, including 250 M below 1 m.

New elevation data triple estimates of global vulnerability to sea-level rise and coastal flooding

(^œ[Full size image, with explanation](#))

(Scott A. Kulp and Benjamin H. Strauss, ^œ[New elevation data triple estimates of global vulnerability to sea-level rise and coastal flooding](#), *Nature Communications*, volume10, Article number: 4844 (29 October 2019))

Of course, while warming oceans will, certainly, affect polar ice melt and methane clathrate stability, there are other consequences which also become inevitable. William Leggat *et al* have spelt out the consequences of rapidly warming oceans for coral reefs:

Severe marine heatwaves have recently become a common feature of global ocean conditions due to a rapidly changing climate.... These increasingly severe thermal conditions are causing an unprecedented increase in the frequency and severity of mortality events in marine ecosystems, including on coral reefs.... The degradation of coral reefs will result in the collapse of ecosystem services that sustain over half a billion people globally....

Here, we show that marine heatwave events on coral reefs are biologically distinct to how coral bleaching has been understood to date, in that heatwave conditions result in an immediate heat-induced mortality of the coral colony, rapid coral skeletal dissolution, and the loss of the three-dimensional reef structure.

During heatwave-induced mortality, the coral skeletons exposed by tissue loss are, within days, encased by a complex biofilm of phototrophic microbes, whose metabolic activity accelerates calcium carbonate dissolution to rates exceeding accretion by healthy corals and far greater than has been documented on reefs under normal seawater conditions. This dissolution reduces the skeletal density and hardness and increases porosity.

These results demonstrate that severe-heatwave-induced mortality events should be considered as a distinct biological phenomenon from bleaching events on coral reefs. We also suggest that such heatwave mortality events, and rapid reef decay, will become more frequent as the intensity of marine heatwaves increases and provides further compelling evidence for the need to mitigate climate change and instigate actions to reduce marine heatwaves.

(William Leggat *et al*, [Rapid Coral Decay Is Associated with Marine Heatwave Mortality Events on Reefs](#), *Current Biology*, August 8, 2019)

As the authors conclude, 'heatwave conditions result in an immediate heat-induced mortality of the coral colony, rapid coral skeletal dissolution, and the loss of the three-dimensional reef structure'. This is far more than an unfortunate problem for eco-tourism. Billions of human beings around the world rely on such resources for their very existence.

Cataclysmic disintegration of planetary terrestrial, marine and freshwater environments 🌊

 (24/05/19)(28/05/19)(09/12/19) (18/12/19) (02/05/21) (03/05/21) (10/01/17)(31/12/17)(06/02/18)
(11/03/20)(27/03/20) (13/06/20) (12/06/24) (13/09/24)

We are in the process of triggering cataclysmic disintegration of planetary terrestrial, marine and freshwater environments and their collapse is almost certainly going to be over 'human' timescales of years and decades, not centuries.

While the Western World fixates on the [immature, belligerent ambitions of its 'leaders'](#), threatening World War 3, catastrophic conditions, of a very different kind [may loom in humanity's near future](#).

As Paul Voosen summarized

Some 250 million years ago, more than 80% of marine species and two-thirds of those on land died off in the end-Permian mass extinction - the closest life ever came to annihilation. Most scientists think massive volcanic eruptions in what is now Siberia triggered the event by spewing carbon dioxide (CO₂) and warming the planet. But

according to a modeling study published on [September 13, 2024], the Great Dying was primed by a mega - El Niño pattern in the global ocean of the time, leading to weather extremes that killed off forests and kicked off the extinctions.
(Paul Voosen, ^œ[Strong El Niños primed Earth for mass extinction](#), *Science*, 13 September 2024)

Yadong Sun *et al* explained:

The ultimate driver of the end-Permian mass extinction is a topic of much debate. Here, we used a multiproxy and paleoclimate modeling approach to establish a unifying theory elucidating the heightened susceptibility of the Pangean world to the prolonged and intensified El Niño events leading to an extinction state.

As atmospheric partial pressure of carbon dioxide doubled from about 410 to about 860 ppm (parts per million) in the latest Permian, the meridional overturning circulation collapsed, the Hadley cell contracted, and El Niños intensified. The resultant deforestation, reef demise, and plankton crisis marked the start of a cascading environmental disaster.

Reduced carbon sequestration initiated positive feedback, producing a warmer hothouse and, consequently, stronger El Niños. The compounding effects of elevated climate variability and mean state warming led to catastrophic but diachronous terrestrial and marine losses.

(Yadong Sun *et al*, ^œ[Mega El Niño instigated the end-Permian mass extinction](#), *Science*, 13 September, 2024)

As the 21st century continues to unfold, the evidence for looming natural disaster grows. [Peter Grace and Louise Barton explained](#) the significance of atmospheric N₂O emissions: one tonne of nitrous oxide is equivalent to 298 tonnes of carbon dioxide and nitrous oxide has an atmospheric lifetime of 110 years. And, of course, it plays a major role in stratospheric ozone depletion.

Elisabeth Ramm *et al*, in a research report entitled 'The Forgotten Nutrient - The Role of Nitrogen in Permafrost Soils of Northern China', have explained why the often overlooked contribution of nitrous oxide to the greenhouse gas problems humanity is confronting needs to be addressed⁷⁷⁶.

Hanqin Tian *et al*, in 2024, show that nitrous oxide remains a forgotten but extremely important and growing source of global warming. As a summary of their detailed research explains:

In an era when greenhouse gas emissions must decline to reduce global warming, in 2020 and 2021 nitrous oxide flowed into the atmosphere at a faster rate than at any other time in history, the international team of researchers reported. On Earth, excess nitrogen contributes to soil, water, and air pollution. In the atmosphere, it depletes the ozone layer, and exacerbates climate change.

Agricultural emissions reached 8 million metric tons in 2020, a 67 percent increase from the 4.8 million metric tons released in 1980, according to the study, the most comprehensive study of global nitrous oxide emissions and sinks produced by a team of 58 researchers from 55 organizations in 15 countries.

"Nitrous oxide emissions from human activities must decline in order to limit global temperature rise to 2°C as established by the Paris Agreement," said the report's lead author, Hanqin Tian, the Schiller

Institute Professor of Global Sustainability at Boston College. "Reducing nitrous oxide emissions is the only solution since at this point no technologies exist that can remove nitrous oxide from the atmosphere."

The concentration of atmospheric nitrous oxide reached 336 parts per billion in 2022, a 25 percent increase over pre-industrial levels that far outpaces predictions previously developed by the Intergovernmental Panel on Climate Change, said Tian, director of the Center for Earth System Science and Global Sustainability at BC's Schiller Institute for Integrated Science and Society.

"This emission increase is taking place when the global greenhouse gasses should be rapidly declining towards net zero emissions if we have any chances to avoid the worst effects of climate change," said Tian, who coordinated the research on behalf of the Global Carbon Project.

(Hanqin Tian *et al*, [∞][Global nitrous oxide budget \(1980-2020\)](#), *Earth System Science Data, Copernicus Publications*, June 11, 2024)

(See also: [∞][New study finds human-caused nitrous oxide emissions grew 40 percent from 1980-2020, greatly accelerating climate change](#))

With the Western World apparently determined, at any cost, to defend its 500 year belief in its right to hegemonic control over humanity, looming climate disaster is put on the back-burner. Protecting humanity from the catastrophic consequences of their rape of its environments is, after all, far less important than [clinging on to the tattered vestiges of their colonial and neocolonial empires](#).

Of course, there are, in a time when anthropogenically driven changes are moving us into uncharted waters, a range of possible consequences, some of them contradictory in nature. One such, possibly catastrophic, set of possibilities relates to the slowing of the Atlantic Meridional Overturning Circulation (AMOC) which transports warm water from the Southern Hemisphere into the North Atlantic. ⁷⁷⁷.

As a summary of findings of research into similar events in previous interglacial periods in earth's history has explained:

...The warm North Atlantic Current - the northernmost part of the Gulf Stream - flows into the Greenland Sea. It becomes progressively colder and saltier due to heat loss to the air, eventually sinking and forming the North Atlantic Deep Water formation - a mass of deep, cold water that flows southward. Melting of the polar ice sheet in the Arctic region would result in more fresh water entering the ocean and disrupting that circulation pattern, potentially causing cooling in northern areas of Europe and North America.

In their 2014 study, the scientists presented evidence of disruptions in the North Atlantic Deep Water formation during the last interglacial period (the Eemian) about 116,000 to 128,000 years ago. Increased freshwater entering the Arctic region due to melting of the polar ice sheet in a warmer world may have disrupted circulation, which normally brings warmer water to the ocean off northern regions of North America and Europe. Such disruptions seem to last around a century or more.

The latest study covers three other warm interglacial periods within the past 450,000 years. During all of them, regardless of the degree of global warming, the scientists found similar century-long disruptions of

the North Atlantic Deep Water formation. And they found that such disruptions are more easily achieved than once believed and took place in climate conditions similar to those we may soon face with global warming.

(Rutgers University, [How stable is deep ocean circulation in warmer climate?](#) Altered circulation might have cooled northern areas of North America and Europe, *EurekAlert*, News Release 26 March, 2020)

The referenced article summed it up:

Disrupting deep circulation

Atlantic Meridional Overturning Circulation (AMOC) and the related process of North Atlantic Deep Water (NADW) have been thought to be stable during warm, interglacial periods. Galaasen et al. report that episodes of reduced NADW over the past 500,000 years actually have been relatively common and occasionally long-lasting features of interglacials and that they can occur independently of the catastrophic freshwater outburst floods normally thought to be their cause (see the Perspective by Stocker). This discovery implies that large NADW disruptions might be more likely than we have assumed in the warmer climate of the future.

(Eirik Vinje Galaasen et al, [Interglacial instability of North Atlantic Deep Water ventilation](#), *Science*, :Vol. 367, Issue 6485, pp. 1485-1489, 27 Mar 2020)

Katinka Bellomo et al have described alternative scenarios for warming in the North Atlantic:

In climate model simulations of future climate change, the Atlantic Meridional Overturning Circulation (AMOC) is projected to decline. However, the impacts of this decline, relative to other changes, remain to be identified.

Here we address this problem by analyzing 30 idealized abrupt-4xCO₂ climate model simulations. We find that in models with larger AMOC decline, there is a minimum warming in the North Atlantic, a southward displacement of the Inter-tropical Convergence Zone, and a poleward shift of the mid-latitude jet.

The changes in the models with smaller AMOC decline are drastically different: there is a relatively larger warming in the North Atlantic, the precipitation response exhibits a wet-get-wetter, dry-get-drier pattern, and there are smaller displacements of the mid-latitude jet. Our study indicates that the AMOC is a major source of inter-model uncertainty, and continued observational efforts are needed to constrain the AMOC response in future climate change.

(Katinka Bellomo et al, [Future climate change shaped by inter-model differences in Atlantic meridional overturning circulation response](#), *Nature Communications*, vol. 12, No. 3659, 16 June 2021)

Nicholas Kristof described a few of the 21st century consequences of rampant deregulated capitalism for the rest of the world:

She is just a frightened mom, worrying if her son will survive, and certainly not fretting about American politics - for she has never heard of either President Obama or Donald Trump.

What about America itself? Ranomasy, who lives in an isolated village on this island of Madagascar off southern Africa, shakes her head. It doesn't ring any bells.

Yet we Americans may be inadvertently killing her infant son. Climate change, disproportionately caused by carbon emissions from America, seems to be behind a severe drought that has led crops to wilt across seven countries in southern Africa. The result is acute malnutrition for 1.3 million children in the region, the United Nations says.

...The U.N. World Food Program has urgently appealed for assistance, but only half the money needed has been donated.

The immediate cause of the droughts was an extremely warm El Niño event, which came on top of a larger drying trend in the last few decades in parts of Africa. New research, just published in the ^œ[Bulletin of the American Meteorological Society](#), concludes that human-caused climate change exacerbated El Niño's intensity and significantly reduced rainfall in parts of Ethiopia and southern Africa.

The researchers calculated that human contributions to global warming reduced water runoff in southern Africa by 48 percent and concluded that these human contributions "have contributed to substantial food crises."

...^œ[The United States](#) single-handedly accounts for more than ^œ[one-quarter of the world's carbon dioxide emissions](#) over the last 150 years, more than twice as much as any other country.

The basic injustice is that ^œ[we rich countries produced the carbon](#) that is devastating impoverished people from Madagascar to Bangladesh. In America, climate change costs families beach homes; in poor countries, parents lose their children.

(Nicholas Kristof, SundayReview | Op-Ed Columnist, ^œ[As Donald Trump Denies Climate Change, These Kids Die of It](#), *New York Times*, Jan 6, 2017)

In the start of summer 2019 in the Southern Hemisphere the chills of Spring, in my neck of the woods, should have been hanging around in mid-December, perhaps moving into the mid-20°C range (even into the low 30s) - a day earlier it topped out at 17°C. But, at 5.15pm on Wednesday (18/12) in the late afternoon, it was 43°C. On 20/12 it peaked at 47°C, seesawing from the mid-20°C to the mid-40°C range. 'Normal' conditions are becoming less and less of a guide to the future as the years pass.

[The myopic stupidity of many who live within the bubble of Western capitalism](#) 🐼

 (02/02/24)

The myopic, [sociopathic](#) stupidity of many who live within the bubble of Western capitalism can be breath-taking⁷⁷⁸. The 2019 US Secretary of State, Mike Pompeo, and the Administration within which he served demonstrated [a willful ignorance](#) hard to believe possible in a supposedly 'developed' nation. The ^œ[UN Climate Change Conference - December 2019](#) in Madrid ended without an agreement - major polluters refused to commit to future action - again!

US singer Bing Crosby, in the 1950s, might have crooned "You've got to accentuate the positive; Eliminate the negative; And latch on to the affirmative" but the bizarre behavior and pronouncements of the 2019 US President and his appointed officials, at a time when the world desperately needed emphatic leadership in tackling the looming problems, almost certainly condemns humanity to a catastrophic future.

We no longer have to prognosticate that catastrophic future. It is already on our doorstep! One no longer has to turn to Third World countries for illustration: The effects are already impacting the 'developed' world!

We are on the cusp of changes greater than those seen in the past ten thousand years. Gregory Cooper, Simon Willcock and John Dearing have explained:

Regime shifts can abruptly affect hydrological, climatic and terrestrial systems, leading to degraded ecosystems and impoverished societies. While the frequency of regime shifts is predicted to increase, the fundamental relationships between the spatial-temporal scales of shifts and their underlying mechanisms are poorly understood.

Here we analyse empirical data from terrestrial ($n = 4$), marine ($n = 25$) and freshwater ($n = 13$) environments and show positive sub-linear empirical relationships between the size and shift duration of systems. Each additional unit area of an ecosystem provides an increasingly smaller unit of time taken for that system to collapse, meaning that large systems tend to shift more slowly than small systems but disproportionately faster.

We substantiate these findings with five computational models that reveal the importance of system structure in controlling shift duration. The findings imply that shifts in Earth ecosystems occur over 'human' timescales of years and decades, meaning the collapse of large vulnerable ecosystems, such as the Amazon rainforest and Caribbean coral reefs, may take only a few decades once triggered....

As they conclude:

The exponentially increasing global trends of many social and biophysical variables over the past 65 years are widely viewed as unsustainable. Along with the evidence for increasingly strong reinforcing feedbacks, interactions and couplings between variables, there is growing awareness around the heightened risk of current anthropogenic activities triggering sub-global regime shifts.

Combined with the findings presented here, humanity now needs to prepare for changes in ecosystems that are faster than we previously envisaged through our traditional linear view of the world, including across Earth's largest and most iconic ecosystems, and the social-ecological systems that they support.

(Cooper, G. S., Willcock, S. and Dearing, J. A. [Regime shifts occur disproportionately faster in larger ecosystems](#). *Nature Communications*, Volume 11, Article number: 1175 (10 March, 2020))

Ian James, in an *azcentral* article entitled 'As a hotter, drier climate grips the Colorado River, water risks grow across the Southwest', provides a description of the consequences of an ongoing drought affecting the Colorado River's catchments area. We are going to have to become used to stories of this nature as the 21st century unfolds!

The water level of Lake Mead, the country's largest reservoir, has dropped more than 130 feet since the beginning of 2000, when the lake's surface lapped at the spillway gates on Hoover Dam.

Twenty-one years later, with the Colorado River consistently yielding less water as the climate has grown warmer and drier, the reservoir near Las Vegas sits at just 39% of capacity. And it's approaching the

threshold of a shortage for the first time since it was filled in the 1930s.

The latest projections from the federal government show the reservoir will soon fall 7 more feet to cross the trigger point for a shortage in 2022, forcing the largest mandatory water cutbacks yet in Arizona, Nevada and Mexico.

The river's reservoirs are shrinking as the Southwest endures an especially severe bout of dryness within a two-decade drought intensified by climate change, one of the driest periods in centuries that shows no sign of letting up.

(Ian James, ^œ[As a hotter, drier climate grips the Colorado River, water risks grow across the Southwest](#), *azcentral*, April 23, 2021)

Lili Pike, for *NASA Earth Observatory*, explained what is happening across many of the western US states in 2021:

The Western US is in the midst of yet another dangerous dry spell. The drought has been building over the past year, and since November, a greater stretch of the West has been in the most severe category of drought than at any time in the 20 years that the National Drought Mitigation Center has been keeping records.

Western states are already facing water shortages, and with the National Weather Service projecting that the dry stretch will continue, the problems that accompany droughts are likely to pile up heading into this summer.

Ryan Jensen saw the impacts of California's last major drought firsthand while working for the Community Water Center in the San Joaquin Valley. When residential wells ran dry, students had to shower in their school locker rooms. To keep toilets running, some rural households relied on hoses slung over fences from their neighbors.

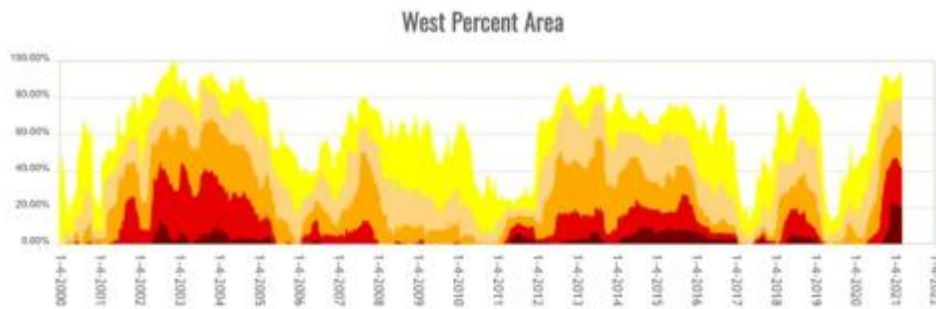

With groundwater depleted by that drought, which only ended in 2017, and ongoing overuse of water on farms, families have had to dig deeper wells, which can be prohibitively expensive.

"For some folks, the last drought never really ended. There are still homes in the San Joaquin Valley that have been on a water tank since the last drought," said Jensen, who works in the center's Visalia office.

That last drought also led to other fallouts: billions of dollars in economic losses as farmers were forced to let fields lie fallow and a 50 percent drop in electricity production from dams. It also contributed to the death of over 100 million trees, which fuels bigger wildfires, like the ones that ripped through the West last summer. If the current drought continues, similarly stark consequences lie ahead.

Unfortunately, these droughts in rapid succession aren't an aberration but rather a sign of what's to come. Climate change is driving more severe droughts and spurring longer, more troubling "megadroughts" across the Western states....

The trajectory of this drought episode remains unclear, but scientists say that it is actually part of a bigger megadrought - a decades-long dry spell, punctuated by severe droughts. This megadrought began around 2000, and as the chart below shows, the majority of land in the West has been in some level of drought ever since.

Over the past 20 years, the Western US has experienced frequent severe droughts, which together form a megadrought. (The Y-axis shows the percent of Western land that is in some kind of drought. The darker colors represent more severe categories of drought.) US Drought Monitor

(Lili Pike, [∞][The megadrought parching 77 percent of the Western US, explained, Earth Observatory, NASA, March 13, 2021](#))

A 2019 *Science* news item illustrates one of the many developing crises with which humanity will have to grapple through the 21st Century:

Millions without water as reservoirs in India run dry

Climate change

The four reservoirs that supply Chennai, India's sixth largest city, have run dry, plunging its estimated 10 million residents into an acute water shortage. Clashes broke out in the streets last week as tens of thousands of people stood for hours in scorching heat to collect water trucked in by the government; many businesses and restaurants were forced to close. Weakening monsoons and rising temperatures have emptied the reservoirs, experts say, while groundwater supplies have been depleted by overuse. Chennai's plight - one of many water emergencies hitting cities from Cape Town, South Africa, to São Paulo, Brazil - is part of the worst water crisis in India's history, with an estimated 600 million people facing acute scarcity. What water exists often isn't safe to drink - some 70% of groundwater is contaminated with iron, fluorides, arsenic, or nitrates, killing nearly 200,000 people each year, according to government reports. And things may soon get worse: Forecasts suggest 40% of India's population will have no access to drinking water by the year 2030.

([∞][Science 28 Jun 2019](#), Vol. 364, Issue 6447, P. 1212)

Billions of people around the world rely on glacier discharge for their water needs and, in the early 21st century, many of those glaciers are in terminal retreat. Romain Hugonnet *et al* have described the situation:

Glaciers, distinct from the Greenland and Antarctic ice sheets, are shrinking rapidly, altering regional hydrology, raising global sea level and elevating natural hazards. Yet, owing to the scarcity of constrained mass loss observations, glacier evolution during the satellite era is known only partially, as a geographic and temporal patchwork,

Here we reveal the accelerated, albeit contrasting, patterns of glacier mass loss during the early twenty-first century.

Using largely untapped satellite archives, we chart surface elevation changes at a high spatiotemporal resolution over all of Earth's glaciers. We extensively validate our estimates against independent, high-precision measurements and present a globally complete and consistent estimate of glacier mass change.

We show that during 2000-2019, glaciers lost a mass of 267 ± 16 gigatonnes per year, equivalent to 21 ± 3 per cent of the observed sea-level rise. We identify a mass loss acceleration of 48 ± 16 gigatonnes per year per decade, explaining 6 to 19 per cent of the observed acceleration of sea-level rise.

Particularly, thinning rates of glaciers outside ice sheet peripheries doubled over the past two decades. Glaciers currently lose more mass, and at similar or larger acceleration rates, than the Greenland or Antarctic ice sheets taken separately.

(Romain Hugonnet *et al*, [Accelerated global glacier mass loss in the early twenty-first century](#), *Nature*, Vol. 592, pp. 726-731, April 28, 2021)

As mountain glaciers shrink, one of the near-term effects is the formation and expansion of unstable glacial lakes which threaten downstream populations. Guoxiong Zheng *et al* have described the effects of such glacial lake outburst floods (GLOF):

Warming on Earth's Third Pole is leading to rapid loss of ice and the formation and expansion of glacial lakes, posing a severe threat to downstream communities. Here we provide a holistic assessment of past evolution, present state and modelled future change of glacial lakes and related glacial lake outburst flood (GLOF) risk across the Third Pole.

We show that the highest GLOF risk is at present centred in the eastern Himalaya, where the current risk level is at least twice that in adjacent regions. In the future, GLOF risk will potentially almost triple as a consequence of further lake development, and additional hotspots will emerge to the west, including within transboundary regions. With apparent increases in GLOF risk already anticipated by the mid-twenty-first century in some regions, the results highlight the urgent need for forward-looking, collaborative, long-term approaches to mitigate future impacts and enhance sustainable development across the Third Pole. (Guoxiong Zheng *et al*, [Increasing risk of glacial lake outburst floods from future Third Pole deglaciation](#), *Nature Climate Change*, Vol. 11, pp. 411-417, 06 May, 2021)

Pressures being placed on groundwater storages around the world.

The effects of both non-polar glacier thinning and retreat, while stark and ominous for the future of millions of people around the world, are matched by the pressures being placed on groundwater storages around the world. Water extraction from aquifers of all sizes is growing exponentially as recurrent droughts and various forms of 'development' drive the need for reliable water sources. The contribution of pumping, in many areas, exceeds natural groundwater replenishment.

Chandrakanta Ojha *et al* have explained what happens as aquifers lose their water,

Groundwater depletion is often accompanied by compaction of aquifer systems and land subsidence. A recent study using high-resolution measurements of vertical land motion provided by interferometric synthetic aperture radar (InSAR) suggests a subsidence rate of ~ 300 mm/year in the [California] southern Central Valley during the previous drought period of 2007-2009...

(Chandrakanta Ojha *et al*, ^{ae}[Groundwater Loss and Aquifer System Compaction in San Joaquin Valley During 2012-2015 Drought](#), *JGR: Solid Earth*, Vol.124, Issue 3, 27 February 2019)

As they explain, Groundwater depletion is often accompanied by compaction of those aquifer systems and land subsidence, reducing their capacity for water storage. The results are becoming increasingly apparent around the world. Wen-Ying Wu *et al* have explained:

Climate-driven GWS [groundwater storage] changes in key aquifers
Our results from CESM [Community Earth System Model] simulations demonstrate that the changes in GWS do not necessarily reflect only the long-term trends in precipitation change; instead, they are also associated with enhancement of evapotranspiration, and reduction in snowmelt. Under future warming environments, the amount of spring snowmelt as a vital water resource in the seasonal snow-cover regions decreases, whereas ET (evapotranspiration, the sum of evaporation and transpiration) increases due to larger atmospheric water demand. Rainfall, ET, and snowmelt are three factors [which] act as the primary mechanisms for driving GWS changes
(Wen-Ying Wu *et al*, ^{ae}[Divergent effects of climate change on future groundwater availability in key mid-latitude aquifers](#), *Nature Communications* Vol.11, No.3710, 24 July 2020)

As Anna Vignet and fellow reporters have explained and illustrated:

Next to the air we breathe, it's the planet's most precious resource: fresh water. And it's disappearing. The world's largest food company describes the lack of water as a looming catastrophe that is expected to play out in the coming decades. In this episode of Reveal, we look at what's happening in places that already are running out of water.
(Anna Vignet, ^{ae}[Water wars](#), *Reveal*, Jan 14, 2017)

Temperature Records keep falling 'nor are those [~~five six seven~~ eight... years an anomaly" 🐼

 (26/05/19) (27/05/19) (30/05/19) (24/09/19) (23/04/20) (30/06/20) (15/07/20) (01/10/20) (19/01/21) (06/07/21) (19/10/23) (25/10/23) (12/08/24)

[Sociopaths are, as is their nature, continuing to commit unspeakable crimes](#), determined to treat fellow human beings with sadistic contempt, engaging in genocide of what they have labelled as 'human animals' and dismissing the looming disasters rapidly overtaking us all. This is not going to end well!

William Ripple *et al* summarize:

Life on planet Earth is under siege. We are now in an uncharted territory. For several decades, scientists have consistently warned of a future marked by extreme climatic conditions because of escalating global temperatures caused by ongoing human activities that release harmful greenhouse gasses into the atmosphere.

Unfortunately, time is up. We are seeing the manifestation of those predictions as an alarming and unprecedented succession of climate records are broken, causing profoundly distressing scenes of suffering to unfold.

We are entering an unfamiliar domain regarding our climate crisis, a situation no one has ever witnessed firsthand in the history of humanity....

Their conclusion:

The effects of global warming are progressively more severe, and possibilities such as a worldwide societal breakdown are feasible and dangerously underexplored (Kemp et al. 2022).

By the end of this century, an estimated 3 to 6 billion individuals - approximately one-third to one-half of the global population - might find themselves confined beyond the livable region, encountering severe heat, limited food availability, and elevated mortality rates because of the effects of climate change (Lenton et al. 2023). Big problems need big solutions.

Therefore, we must shift our perspective on the climate emergency from being just an isolated environmental issue to a systemic, existential threat....

(William J Ripple *et al*, ^œ[The 2023 state of the climate report: Entering uncharted territory](#), *BioScience*, 24 October 2023)

The National Centers for Environmental Information (NCEI), provides a compressed global report release schedule of global temperature anomalies. This can be accessed from their website '^œ[National Centers for Environmental Information](#)'. Ongoing climate anomalies can be accessed from this site so will not be maintained here.

Their ^œ[Global Surface Temperature Dataset](#) provides a regularly updated explanation of what is happening around the world.

The 2023 leap in global temperatures to well over 1.5°C has been explained by James Hansen...Here is his assessment of the 2023 situation:

The September global temperature anomaly leaped to more than +1.7°C relative to the 1880-1920 mean (Fig. 1).

Public discussion has focused on the remarkable magnitude of this monthly anomaly, which exceeds the prior warmest September in the period of instrumental data by about +0.5°C; we will comment on this extreme September anomaly below.

However, the average anomaly of the past 4 months (+0.44°C relative to the same months in 2015, the origin year of the 2015-16 El Nino) is probably more important. If this relative anomaly is maintained through this El Nino (through Northern Hemisphere 2024 spring) the peak 12-month mean global warming will reach +1.6-1.7°C relative to 1880-1920.

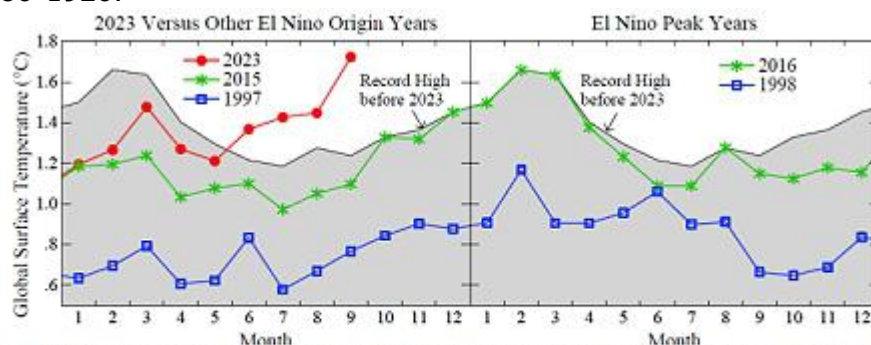

Fig. 1. Global temperature (relative to 1880-1920 mean for each month) for the 1997-98, 2015-16 and 2023-24 El Ninos. The impact of El Nino on global temperature usually peaks early in the year (El Nino Peak Year) following the year in which the El Nino originated.

(James Hansen, Makiko Sato, Reto Ruedy, and Leon Simons, ^œ[El Nino Fizzles. Planet Earth Sizzles. Why?](#), *Hansen Blog*, 13 October 2023)

Justin Gillis and John Schwartz, in a report entitled 'Earth Sets a Temperature Record for the Third Straight Year', have explained one of the many consequences of global warming for the world in which we all live. As they say:

Marking another milestone for a changing planet, scientists reported on Wednesday that the Earth reached its highest temperature on record in 2016 - trouncing a record set only a year earlier, which beat one set in 2014. It is the first time in the modern era of global warming data that temperatures have blown past the previous record three years in a row.

The findings come two days before the inauguration of an American president who has called global warming a Chinese plot and vowed to roll back his predecessor's efforts to cut emissions of heat-trapping gases.

The data show that politicians cannot wish the problem away. The Earth is heating up, a point long beyond serious scientific dispute, but one becoming more evident as the records keep falling. Temperatures are heading toward levels that many experts believe will pose a profound threat to both the natural world and to human civilization.

In 2015 and 2016, the planetary warming was intensified by the weather pattern known as El Niño, in which the Pacific Ocean released a huge burst of energy and water vapor into the atmosphere. But the bigger factor in setting the records was the long-term trend of rising temperature, which scientists say is being driven by increasing levels of carbon dioxide and other greenhouse gases.

(Justin Gillis and John Schwartz, [Earth Sets a Temperature Record for the Third Straight Year](#), *New York Times*, January 18, 2017)

Nor are those three years an anomaly. Blunden, Hartfield, and Arndt have summarized the annual global average carbon dioxide concentration at Earth's surface for 2017 ⁷⁷⁹:

In 2017, the dominant greenhouse gases released into Earth's atmosphere - carbon dioxide, methane, and nitrous oxide - reached new record highs. The annual global average carbon dioxide concentration at Earth's surface for 2017 was 405.0 ± 0.1 ppm, 2.2 ppm greater than for 2016 and the highest in the modern atmospheric measurement record and in ice core records dating back as far as 800 000 years. The global growth rate of CO₂ has nearly quadrupled since the early 1960s.

(Blunden, J., D. S. Arndt, and G. Hartfeld (eds), Abstract, [State of the Climate in 2017](#). Special Supplement to the *Bulletin of the American Meteorological Society*, Vol. 99 No.8, August 2018 [18mb pdf])

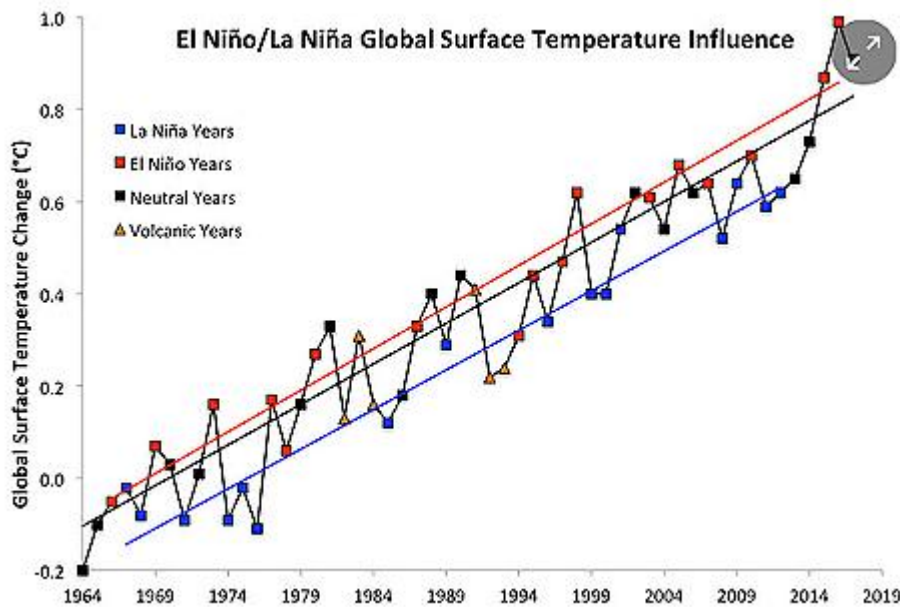

Dana Nuccitelli explained:

In fact, 2017 was the hottest year without an El Niño by a wide margin - a whopping 0.17°C hotter than 2014, which previously held that record. Remarkably, 2017 was also hotter than 2015, which at the time was by far the hottest year on record thanks in part to a strong El Niño event that year.

For comparison, the neutral El Niño conditions and the level of solar activity in 1972 were quite similar to those in 2017. 45 years later, the latter was 0.9°C hotter than the former. For each type of year - La Niña, El Niño, and neutral - the global surface warming trend between

1964 and 2017 is 0.17-0.18°C per decade, which is consistent with climate model predictions.

(Dana Nuccitelli, ^{ae}2017 was the hottest year on record without an El Niño, thanks to global warming, *The Guardian*, 2 January, 2018)

(1964-2017 global surface temperature data from Nasa, divided into El Niño (red), La Niña (blue), and neutral (black) years, with linear trends added.

Illustration: Dana Nuccitelli)

Robert Jackson *et al*, in an examination of increasing anthropogenic methane emissions arising from agricultural and fossil fuel sources, have provided a graphic analysis of the global methane budget for year 2017. Their conclusion:

Methane emissions have continued to rise over the past decade and are tracking concentrations most consistent with the warmest marker scenario of the Intergovernmental Panel on Climate Change (RCP8.5, a representative concentration pathway) that yields an estimated global warming of 4.3 °C by year 2100.

Current trajectories in socioeconomic development also suggest the world is likely to follow IPCC Shared Socioeconomic pathways (SSP) leading to relatively higher emission trajectories over the next decade. Estimates for 2018 and 2019 show increases in atmospheric methane of 8.5 and 10.7 ppb, respectively, two of the four highest annual growth rates since 2000.

Increased emissions from both the agriculture and waste sector and the fossil fuel sector are likely the dominant cause of this global increase, highlighting the need for stronger mitigation in both areas.

Our analysis also highlights emission increases in agriculture, waste, and fossil fuel sectors from southern and southeastern Asia, including China, as well as increases in the fossil fuel sector in the United States. In contrast, Europe is the only continent in which methane emissions appear to be decreasing. While changes in the sink of methane from atmospheric or soil uptake remains possible, atmospheric chemistry and land-surface models suggest the timescales for sink responses are too slow to explain most of the increased methane in the atmosphere in recent years.

Climate policies overall, where present for methane mitigation, have yet to alter substantially the global emissions trajectory to date. (Robert Jackson *et al*, ^œ[Increasing anthropogenic methane emissions arise equally from agricultural and fossil fuel sources](#), *Environmental Research Letters*, Volume 15, Number 7, 07 July 2020)

Risking accusations of being repetitive, one can only say, again, 'Nor are those [four] years an anomaly.' The *World Meteorological Organization* has explained:

2018 is on course to be the 4th warmest year on record. This would mean that the past four years - 2015, 2016, 2017 and 2018 - are also the four warmest years in the series. 2018 is the coolest of the four. In contrast to the two warmest years, 2018 began with weak La Niña conditions, typically associated with lower global temperatures. The 20 warmest years have all occurred in the past 22 years.

(^œ[WMO Provisional statement on the State of the Global Climate in 2018](#), *World Meteorological Organization*, 29 November 2018)

WMO Secretary-General Petteri Taalas, in an explanation of a few of the implications of The ^œ[WMO report on The Global Climate in 2015-2019](#) has spelt out some of the consequences of this warming trend ⁷⁸⁰:

"Climate change causes and impacts are increasing rather than slowing down," said WMO Secretary-General Petteri Taalas, who is co-chair of the Science Advisory Group of the UN Climate Summit.

"Sea level rise has accelerated and we are concerned that an abrupt decline in the Antarctic and Greenland ice sheets, which will exacerbate future rise. As we have seen this year with tragic effect in the Bahamas and Mozambique, sea level rise and intense tropical storms led to humanitarian and economic catastrophes," he said.

"The challenges are immense. Besides mitigation of climate change, there is a growing need to adapt. According to the recent Global Adaptation Commission report the most powerful way to adapt is to invest in early warning services, and pay special attention to impact-based forecasts," he said.

"It is highly important that we reduce greenhouse gas emissions, notably from energy production, industry and transport. This is critical if we are to mitigate climate change and meet the targets set out in the Paris Agreement," he said.

"To stop a global temperature increase of more than 2 degrees Celsius above pre-industrial levels, the level of ambition needs to be tripled. And to limit the increase to 1.5 degrees, it needs to be multiplied by five," he said.

(^œ[Global Climate in 2015-2019: Climate change accelerates](#), *World Meteorological Organization*, 22 September 2019)

We are living in a time when capitalism is being put on trial by nature.⁷⁸¹

It's getting a little monotonous but, for a final time here (see Hansen *et al* ^œ[for an ongoing commentary](#) on this), once again: 'nor are those [~~five six seven~~] eight years an anomaly'.

2021 has continued the trend:

Although average global temperatures were temporarily cooled by the 2020-2022 La Niña events, 2021 was still one of the seven warmest years on record... The average global temperature in 2021 was about

1.11 (± 0.13) °C above the pre-industrial (1850-1900) levels. 2021 is the 7th consecutive year (2015-2021) where global temperature has been over 1°C above pre-industrial levels, according to all datasets compiled by WMO.

(^œ2021 one of the seven warmest years on record, *World Meteorological Organization*, 19 January, 2022)

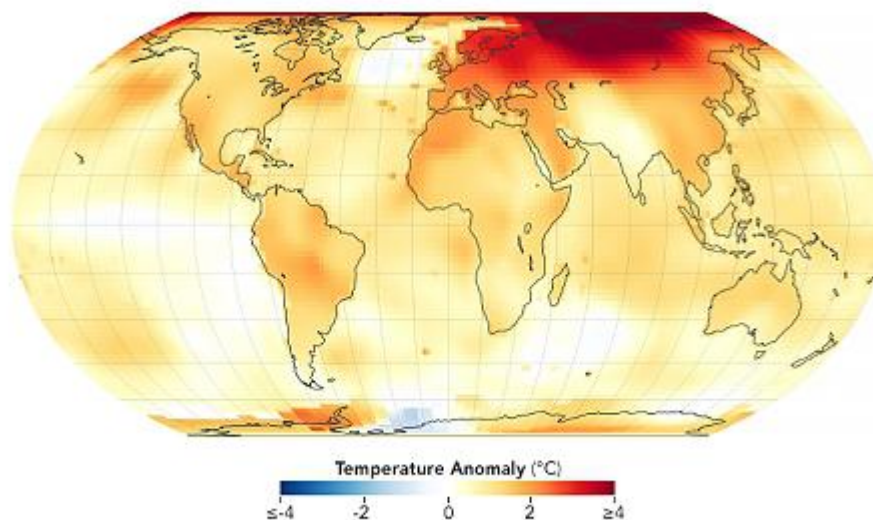

NASA Earth Observatory provided an assessment of 2020 conditions:

Earth's global average surface temperature in 2020 tied with 2016 for the warmest year on record, according to an analysis by NASA.

Continuing the planet's long-term warming trend, the globally averaged temperature in 2020 was 1.02 degrees Celsius (1.84 degrees Fahrenheit) warmer than the baseline 1951-1980 mean, according to scientists at NASA's Goddard Institute for Space Studies (GISS). The year was slightly warmer than 2016 but within the margin of error of the analysis, making the years effectively tied.

"The last seven years have been the warmest seven years on record, typifying the ongoing and dramatic warming trend," said GISS Director Gavin Schmidt. "Whether one year is a record or not is not really that important; the important things are long-term trends. With these trends, and as the human impact on the climate increases, we have to expect that records will continue to be broken."

Earth's average temperature has risen more than 1.2°C (2°F) since the late 19th century

(^œ2020 Tied for Warmest Year on Record, *NASA Earth Observatory*, January 15, 2021)

Zeke Hausfather has elaborated on records set during 2020:

Last year set a number of records for the Earth's climate:

- ^œ**Record warm surface temperatures:** It was the warmest or second warmest year on record for surface temperature - depending on the dataset used - and effectively tied with 2016 within the range of measurement uncertainty in all the surface temperature records examined here. This is all the more remarkable because the latter half of 2020 has seen a natural cooling effect from a modest La Niña event.

- **Record levels of ocean heat content:** It was the warmest year on record for ocean heat content, which increased markedly between 2019 and 2020.
- **Record warmth in satellite records:** It was either the warmest or second warmest year in the Earth's troposphere - the lower part of the atmosphere - depending on the dataset examined.
- **Arctic sea ice sees second lowest summer minimum:** It saw record lows in sea ice extent and volume in the Arctic for much of the period between July and November. The minimum Arctic sea ice extent reached in September was the second lowest on record.
- **Sea levels continue to rise:** Global sea levels and atmospheric greenhouse gas concentrations reached new record highs in 2020, while the world's glaciers continued to melt rapidly.
(Zeke Hausfather, [State of the climate: 2020 ties as warmest year on record](#), *Carbon Brief*, 14 January 2021)

In an earlier analysis he has provided an estimation of the time scale for the world exceeding 1.5°C and 2°C of global warming:

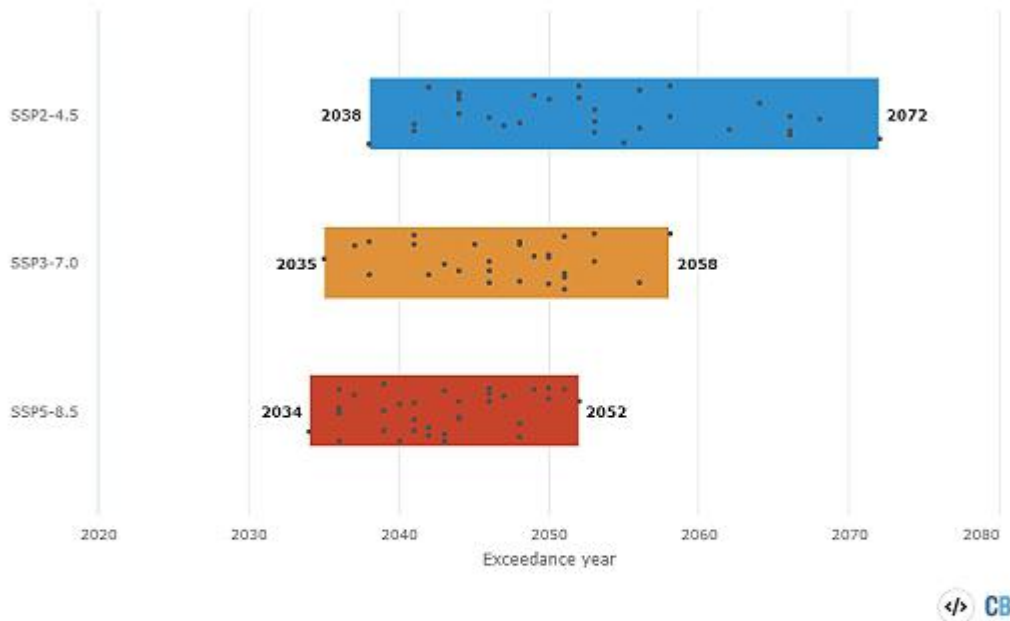

Our analysis shows that:

- The world will likely exceed 1.5C between 2026 and 2042 in scenarios where emissions are not rapidly reduced, with a central estimate of between 2030 and 2032.
- The 2C threshold will likely be exceeded between 2034 and 2052 in the highest emissions scenario, with a median year of 2043.
- In a scenario of modest mitigation - where emissions remain close to current levels - the 2C threshold would be exceeded between 2038 and 2072, with a median of 2052.

He provides a graphic of likely exceedance years for 2°C across all currently available CMIP6 [the latest (2021) generation of climate models] model runs for SSP2-4.5, SSP3-7.0 and SSP5-8.5 scenarios (SSP3-7.0 is based on a modest-mitigation of current pollution levels):

Year in which 2C is exceeded in CMIP6 models

Based on both historical temperatures through 2020 and subsequent smoothed CMIP6 data

Exceedance year for 2C across all currently available CMIP6 model runs for SSP2-4.5, SSP3-7.0 and SSP5-8.5 scenarios. Chart by Carbon Brief using [Highcharts](#).

Temperatures are expected to pass 2C in the modest-mitigation SSP2-4.5 scenario – where emissions remain around current levels – between 2038 and 2072, with a median year of 2052.

(Zeke Hausfather, ^{ae}[Analysis: When might the world exceed 1.5C and 2C of global warming?](#), *Carbon Brief*, 4 December, 2020)

Greenhouse gas emissions continued to rise through 2020, despite that being a year of Covid-19 'lockdowns' and depressed economic activity. As the UK Met Office has explained:

We forecast the annual average CO₂ concentration at Mauna Loa to be 2.74 ± 0.57 parts per million (ppm) higher in 2020 than in 2019 (Figure 1). This will continue the rising trend in CO₂ seen in the long-term record of measurements from the Mauna Loa observatory in Hawaii that date back to 1958 and are a good guide to global CO₂ levels. As a result, we forecast the 2020 annual average CO₂ concentration at Mauna Loa to be 414.2 ± 0.6 ppm. For the first time, monthly CO₂ levels will exceed 415 ppm (during spring and summer) and will remain above 410 ppm for the entire year...

Long-term increases in observed CO₂ are entirely the result of human-caused emissions of carbon dioxide into the atmosphere - more than enough CO₂ has been emitted by fossil fuel burning, cement production and deforestation to account for the increase measured in the atmosphere. CO₂ concentrations have increased by about 30% since measurements began at Mauna Loa, but this increase would have been larger if some CO₂ had not been removed from the atmosphere by absorbed by plants and the oceans.

(UK Met Office, ^{ae}[Mauna Loa carbon dioxide forecast for 2020](#), accessed 23/04/20)

Paul Voosen summed up the 2020 scene:

The subtropical Atlantic Ocean was particularly hot, fueling a record outbreak of hurricanes, says Lijing Cheng, a climate scientist at the Chinese Academy of Sciences's Institute of Atmospheric Physics....

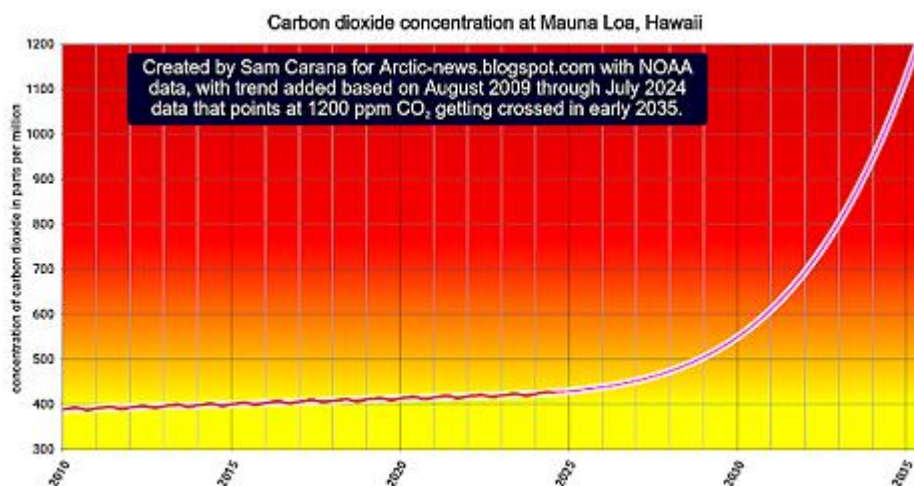

This heat, monitored down to 2000 meters by a fleet of 4000 robotic probes, is spreading deeper into the ocean while also migrating toward the poles. An extreme heat wave struck the northern Pacific, killing marine life. For the first time, warm Atlantic waters were seen penetrating into the Arctic Ocean, melting sea ice from below and reducing its extent nearly to a record low (Science, 28 August 2020, p. 1043). The warming ocean and melting ice sheets are raising sea levels by 4.8 millimeters per year, and the rate is accelerating (Science, 20 November 2020, p. 901).

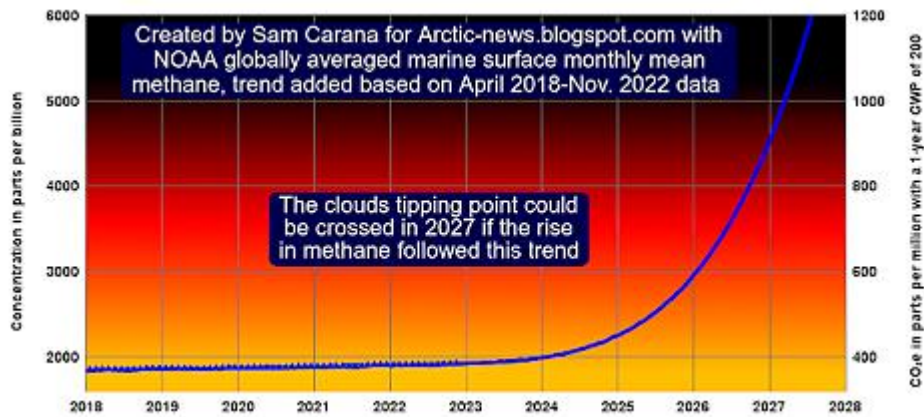

On land, 2020 was even more relentless, with temperatures rising 1.96°C above preindustrial levels, a clear record, Berkeley Earth reported. It was the warmest year ever in Asia and Europe and tied for the warmest in South America. Russia was particularly hot, breaking its previous record by 1.2°C, while swaths of Siberia were 7°C warmer than in preindustrial times, leading to largescale fires and thawing permafrost that caused buildings to founder and set off oil spills (Science, 7 August 2020, p. 612). "Siberia was crazy," says Zeke Hausfather, a climate scientist at the Breakthrough Institute and coauthor of the Berkeley Earth analysis. "That heat would effectively be impossible without the warming we've seen."

(Paul Voosen, [Global temperatures in 2020 tied record highs: Defying cooling from La Niña, warming planet speeds toward breach of climate targets](#), *Science*, Vol. 371: Issue 6527, Pp. 334-5, January 22, 2021)

And, of course, there's always methane! 🐉

 (09/08/24) (26/08/24)

Both CO_2 and CH_4 levels in the atmosphere have, in the past five years, gone into overdrive.

An *Arctic News* summary describes what is happening:

The ...trend points at 430 ppm CO_2 getting crossed in February 2025, which would constitute a jump of 10 ppm in two years time (from 420 ppm in February 2023 to 430 ppm in February 2025). Despite numerous warnings and despite politicians' pledges to act decisively, the concentration of CO_2 in the atmosphere is growing rapidly.

If this trend continues, 1200 ppm CO_2 could be crossed in early 2035.

In other words, the CH_4 clouds tipping point could get crossed in early 2035 due to the rise in CO_2 alone....

When using a Global Warming Potential (GWP) of 200 for methane, a concentration of 2000 ppb corresponds with 400 ppm CO_2e . Together with a daily peak CO_2 concentration of 430 ppm, this adds up to a joint CO_2e of 830 ppm, i.e. only 370 ppm away from the clouds tipping point at 1200 ppm CO_2e . This 370 ppm CO_2e could be added almost instantly by a burst of seafloor methane less than the size of the methane that is currently in the atmosphere (about 5 Gt).

There is plenty of potential for such an abrupt release, given the rising ocean heat and the vast amounts of carbon and methane contained in vulnerable sediments at the seafloor of the Arctic Ocean...

(CH_4 Carbon dioxide [and methane are] growing rapidly, *Arctic News*, August 22, 2024)

The accepted understanding among those who comment on these matters is that one should avoid or strongly qualify assessments which appear extreme or indulge in prognostications based on 'worst case scenarios'. The above assessments of the trajectories of both CO_2 and methane concentrations over time might well be judged to be biased toward 'worst case scenarios'

I leave it to the reader to determine how much weight should be given to these assessments.

However I would suggest that since actual trajectories have consistently coincided with the most severe of the accepted predictions and since any number of unrecognized 'tipping points' might loom in our short to medium term future, forecasts of this nature should inform/ influence our understanding.

The world is entering a period during which the first signs of feedback loops in the production of gases which contribute to a warming planet are emerging. Not least among these is increases in microbial methane production as the atmosphere warms. Yizhu Zhu *et al* explained:

Net emissions of the potent GHG methane from ecosystems represent the balance between microbial methane production (methanogenesis) and oxidation (methanotrophy), each with different sensitivities to temperature. How this balance will be altered by long-term global warming, especially in freshwaters that are major methane sources, remains unknown.

...[W]e show that the experimental warming of artificial ponds over 11 years drives a disproportionate increase in methanogenesis over methanotrophy that increases the warming potential of the gases they emit. The increased methane emissions far exceed temperature-based predictions, driven by shifts in the methanogen community under warming, while the methanotroph community was conserved.

Our experimentally induced increase in methane emissions from artificial ponds is, in part, reflected globally as a disproportionate increase in the capacity of naturally warmer ecosystems to emit more methane. Our findings indicate that as Earth warms, natural ecosystems will emit disproportionately more methane in a positive feedback warming loop.

(Yizhu Zhu *et al*, [Disproportionate increase in freshwater methane emissions induced by experimental warming](#), *Nature Climate Change*, 29 June 2020)

A *Queen Mary University of London* press release entitled '[Global warming will cause ecosystems to produce more methane than first predicted](#)' explains the significance of such methane increases:

Methane is a powerful greenhouse gas with around 28 times the global warming potential of carbon dioxide over a 100 year period. Over 40 per cent of methane is released from freshwaters such as wetlands, lakes and rivers making them a major contributor to global methane emissions.

A year after the *World Meteorological Organization's* warning that "it is highly important that we reduce greenhouse gas emissions, notably from energy production, industry and transport", a 2020 research report into anthropogenic methane gas emissions [from the US Permian Basin](#) provides a sobering assessment of methane emissions from the region (southeast New Mexico and west Texas, one of the world's most prolific oil-producing regions in recent years, producing 3.5 million barrels of crude and 11 billion cubic feet of natural gas per day (about 30% and 10% of the respective U.S. totals in 2018)).

A summary of the findings explained:

Using new satellite observations and atmospheric inverse modeling, we report methane emissions from the Permian Basin, which is among the world's most prolific oil-producing regions and accounts for >30% of total U.S. oil production. Based on satellite measurements from May 2018 to March 2019, Permian methane emissions from oil and natural gas production are estimated to be $2.7 \pm 0.5 \text{ Tg a}^{-1}$, representing the largest methane flux ever reported from a U.S. oil/gas-producing region and are more than two times higher than bottom-up inventory-based estimates.

This magnitude of emissions is 3.7% of the gross gas extracted in the Permian, i.e., ~60% higher than the national average leakage rate. The high methane leakage rate is likely contributed by extensive venting and flaring, resulting from insufficient infrastructure to process and transport natural gas. This work demonstrates a high-resolution satellite data-based atmospheric inversion framework, providing a robust top-down analytical tool for quantifying and evaluating subregional methane emissions.

(Yuzhong Zhang *et al*, [Quantifying methane emissions from the largest oil-producing basin in the United States from space](#), *Science Advances*, Vol. 6, no. 17, 22 Apr 2020:)

We are heading into a new world, a world of unpleasant, uncontrollable surprises. Walter Anthony *et al*, in a study of arctic upland taliks (layers of year-round unfrozen ground that lies in arctic permafrost areas) , found that such areas are already producing unexpectedly large methane emissions. As they describe:

...talik (perennially thawed soils in permafrost) development in unsaturated Yedoma uplands [an organic-rich (about 2% carbon by mass) Pleistocene-age permafrost with ice content of 50 - 90% by volume] leads to unexpectedly large methane emissions (35 - 78 mg m⁻² d⁻¹ summer, 150 - 180 mg m⁻² d⁻¹ winter). Upland Yedoma talik emissions were nearly three times higher annually than northern-wetland emissions on an areal basis. Approximately 70% emissions occurred in winter, when surface-soil freezing abated methanotrophy, enhancing methane escape from the talik.

As they conclude:

Our study brings to light complexities that change the way we should think about permafrost carbon feedback in the Yedoma domain. Current assumptions that terrestrial uplands will remain an insignificant source of methane or become a stronger sink... will likely lead to considerable underestimation of the radiative forcing associated with greenhouse gas fluxes in upland Yedoma taliks.

Upland Yedoma landscapes with thermokarst mounds [terrain characterised by very irregular surfaces of marshy hollows and small hummocks formed when ice-rich permafrost thaws] differ from other upland environments owing to the development of anaerobic taliks in largely unsaturated, but thick (tens of meters) organic-rich silts. This, together with the formation of post-cryogenic structures that facilitate methane transport from meters belowground, bypassing oxidation, cause Yedoma uplands with thermokarst mounds to have some of the highest methane emissions yet documented among terrestrial Arctic ecosystems, especially in winter.

(K. M. Walter Anthony *et al*, [Upland Yedoma taliks are an unpredicted source of atmospheric methane](#), *Nature Communications*, Vol.15, No: 6056, 2024)

Yet even this is not the full story! Barkley *et al* have explained:

Ethane (C₂H₆), a gas that is co-emitted with thermogenic sources of CH₄, is emitted in the US predominantly by the O&G [oil and gas] sector. In this study, we perform an inverse analysis on 200 h[ours] of atmospheric boundary layer C₂H₆ measurements to estimate C₂H₆ emissions from the US O&G sector. Measurements were collected from 2017 to 2019 as part of the Atmospheric Carbon and Transport (ACT)

America aircraft campaign and encompass much of the central and eastern United States.

We find that for the fall, winter, and spring campaigns, C₂H₆ data consistently exceeds values that would be expected based on EPA O&G leak rate estimates by more than 50%....

..[W]e estimate that O&G CH₄ emissions are larger than EPA inventory values by 48% - 76%.

(Z. R. Barkley *et al*, [∞][Analysis of Oil and Gas Ethane and Methane Emissions in the Southcentral and Eastern United States Using Four Seasons of Continuous Aircraft Ethane Measurements](#), *JGR Atmospheres*, Vol.126, Iss.10, 27 May 2021)

All this demonstrates a cavalier attitude on the part of major oil and gas companies and of those supposedly monitoring their behavior in the US. The 2020 US President is obviously not alone in discounting the dangers of green-house gas emissions.

If, as the [NOAA report](#) says,

Scientists have long recognized the possibility - small, but not zero - that global warming could ignite a "methane bomb" in the Arctic...

and, atmospheric CO₂ concentrations have already exceeded 415 ppm, a level last reached millions of years ago - long before humanity was a gleam in evolution's eye - then why is there no concerted, coordinated international endeavor to avert such extinction level conditions from ever emerging?

The 'methane bomb' requires warming oceans but, as we've already seen, [93% of the heat trapped](#) in a warming earth has gone, not into the atmosphere around us, but into the deep oceans - into the very regions which, if sufficiently warmed, will release the trapped methane from the methane hydrates in which it is currently sequestered. We are, indeed, playing Russian roulette with the fate of humanity.

In 2022 the planet is undeniably warming and potentially catastrophic conditions are already emerging around the world. We are fast approaching uncharted territory. And, where analogs of current conditions can be found in geological records, there is cause for concern that unanticipated conditions might emerge which will fast forward our world into uncontrollable climatic conditions

Syee Weldeab *et al* have provided evidence of the real possibility of methane hydrate instability as ocean temperatures rise:

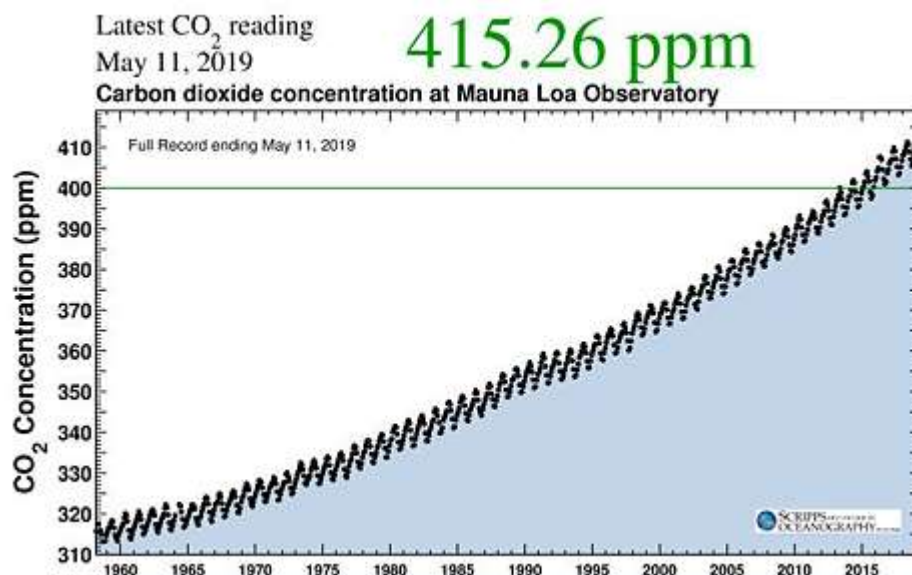

Our results identify an exceptionally large warming of the equatorial Atlantic intermediate waters and strong evidence of methane release and oxidation almost certainly due to massive methane hydrate destabilization during the early part of the penultimate warm episode (126,000 to 125,000 y ago). This major warming was caused by reduced advection of cold water from high latitudes and enhanced downward heat diffusion in response to a brief episode of meltwater-induced weakening of the Atlantic meridional overturning circulation [AMOC] and amplified by a warm mean climate. Our results highlight climatic feedback processes associated with the penultimate climate warming that can serve as a paleoanalog for modern ongoing warming....

AMOC weakening significantly amplifies the warming of intermediate waters and, in turn, destabilizes shallow subsurface methane hydrate deposits. Current studies that are investigating the stability of shallow subsurface methane hydrates assume warming of intermediate waters of only 1 °C to 3 °C, and, as a result, conclude a limited impact on their stability. Robust indications of a steadily weakening AMOC and the amplifying effect of weak AMOC on the warming of intermediate waters, as documented here, require simulation scenarios that consider much greater warming of intermediate waters.

(Syee Weldeab *et al*, [∞][Evidence for massive methane hydrate destabilization during the penultimate interglacial warming, PNAS](#), August 22, 2022)

But, of course, '[great power rivalries](#)' in 2022 are far more important than possible species extinction!

Peter Dockrill has given the CO₂ concentrations for May 2019 in an article entitled 'It's Official: Atmospheric CO₂ Just Exceeded 415 ppm For The First Time in Human History':

Yet another alarming milestone of humanity's damaging effect on the environment has now officially been reached - crossing a barrier into a hot, polluted future like the planet hasn't witnessed in millions of years.

This weekend, sensors in Hawaii recorded Earth's atmospheric concentration of carbon dioxide (CO₂) passing 415 parts per million (ppm) for the first time since before the ancient dawn of humanity.

On Saturday, CO₂ concentration recorded at the Mauna Loa Observatory in Hawaii by researchers from the Scripps Institution of Oceanography hit 415.26 ppm - the latest in a dire series of climatic thresholds being breached by a human society that refuses to relinquish the conveniences afforded by fossil fuels.

"This is the first time in human history our planet's atmosphere has had more than 415 ppm CO₂," meteorologist Eric Holthaus tweeted.

"Not just in recorded history, not just since the invention of agriculture 10,000 years ago. Since before modern humans existed millions of years ago. We don't know a planet like this."

It was only a few years ago that carbon pollution in the atmosphere soared past 400 ppm, and it didn't take long much longer to reach 410 ppm (in 2017).

In fact, with this record-breaking surge in atmospheric carbon poisoning the skies and trapping Earth's heat, scientists knew hitting 415 ppm in 2019 was all but inevitable.

(Peter Dockrill, [∞][It's Official: Atmospheric CO₂ Just Exceeded 415 ppm For The First Time in Human History](#), *Science Alert*, 13 MAY 2019)

Seizing life's opportunities for profit, 'wealth' and planetary 'power' My name is Western Capitalist, King of Kings... 🦁

The escalation of CO₂ concentrations continues unabated providing new highs each year. In May 2022 a new global high was set: 418.43 ppm. Contrary to the expectations of some, the global concentration of Greenhouse Gasses in the atmosphere has continued on its 40+ year upward trajectory. Whatever we believe we're doing to change it is not working!!

But, US Secretary of State Mike Pompeo, in 2019, put it all into perspective for us. There is, indeed, no need for concern. In fact, there is every reason to welcome the planetary increase in CO₂. It presents amazing opportunities for profit. 'The Arctic is heating up far faster than the world average because of rising greenhouse gas emissions' but:

"This is America's moment to stand up as an Arctic nation," Mr. Pompeo said. "The region has become an arena of global power and competition."...

Describing the rapidly warming region as a land of "opportunity and abundance," Mr. Pompeo cited its untapped reserves of oil, gas, uranium, gold, fish, and rare earth minerals. Melting sea ice, he said, is opening up new shipping routes. "We're entering a new age of strategic engagement in the Arctic, complete with new threats to Arctic interests and its real estate,"....

And, of course, since he represents the United States of America,

Mr. Pompeo said that Washington was "fortifying America's security and diplomatic presence" in the region, including with new military exercises and icebreakers.

(Somini Sengupta, [∞][United States Rattles Arctic Talks With a Sharp Warning to China and Russia](#), *New York Times*, May 6, 2019)

How fortunate the world is that, in these times, we have such prescient leaders - ready and willing to seize life's opportunities for profit, 'wealth' and planetary 'power' as they appear over the horizon! Let us be grateful to a United States of America which, at this critical juncture in humanity's future, has given us leaders who know how to "accentuate the positive; Eliminate the negative; And latch on to the affirmative" in life!

Robert English and Morgan Gardner have put the emphasis where it should have been put by Pompeo:

Accurate threat assessment is vital to the formulation of foreign policy. Across centuries of political and technological change, the giants of strategy - from Sun-tzu and Thucydides to Carl von Clausewitz and George Kennan - warned against exaggerating threats and ignoring their geopolitical context. Still, [ideologically driven threat inflation](#) -

from a phantom Vietnamese attack in the Gulf of Tonkin to nonexistent Iraqi nuclear and chemical weapons - has repeatedly led the United States into costly quagmires. Despite this history, the country is again on the brink of an ideologically driven blunder - this time in the Arctic.

...[T]he administration of U.S. President Donald Trump has recently embraced Arctic alarmism with a vengeance. It has stoked fears of Russian and Chinese "aggression," trashed the Arctic Council's delicate diplomacy, and adopted a new confrontational posture. In so doing, it joins the alarmists in three serious mistakes: the failure to assess specific threats accurately, the failure to consider an adversary's forces in relation to those of the United States and its allies, and the failure to evaluate the broader strategic landscape - the political, economic, and environmental factors beyond the battlefield. Violation of these three pillars of careful threat assessment is drawing the United States toward an unnecessary confrontation in a region where the real enemy isn't Cold War ghosts but looming environmental disaster.

(Robert David English and Morgan Grant Gardner, ^œ[Phantom Peril in the Arctic: Russia Doesn't Threaten the United States in the Far North - But Climate Change Does](#), *Foreign Affairs*, September 29, 2020)

Continue on the road which has been set and humanity might survive but at a fearful cost.

Bill Henderson spells out the problem for those still looking for medium- to long-term solutions to the problems of green-house-gas accumulation and other forms of planetary pollution:

...[C]onsidering the emerging climate science and our diminished carbon budget after at least three decades of denial, and with carbon concentration in the atmosphere higher than it has been in 3 million years, it is too late to speed up the slow transition from fossil fuels to renewables with government facilitated renewable building; too late to build renewables under a Keynesian plan that employs all the workers in transition; too late for a transition that makes money and lets us keep living our present lifestyles.

The GND challenged neoliberalism with a "Big Government Plan" for climate mitigation, but as presently envisioned, these policy actions remain completely within a market transition where renewables will only replace fossil fuels by out-competing coal, oil and natural gas.

The GND could greatly speed up this slow transition, but it's still a plan to let fossil fuels compete for far too long; it still doesn't regulate production and distribution; it still envisions supplying 100 percent of today's energy, plus projected growth. The GND is ultimately predicated upon a growing GDP in a business-as-usual scenario where there is enough created wealth to redistribute to marginalized populations.

(Bill Henderson, ^œ[It's Too Late for a Green New Deal; Can Other Radical Plans Work?](#) *Truthout*, May 26, 2019)

Summarizing the findings of a ^œ[statistical study](#) released in the journal *Nature* on Wednesday 6 December 2017 (^œ[free pdf \(8.46 MB\) here](#)), Chris Mooney spelt out the looming danger of a warming planet:

Under a high warming scenario in which large emissions continue throughout the century, the models as a whole give a mean warming of 4.3 degrees Celsius (or 7.74 degrees Fahrenheit), plus or minus 0.7 degrees Celsius, for the period between 2081 and 2100, the study

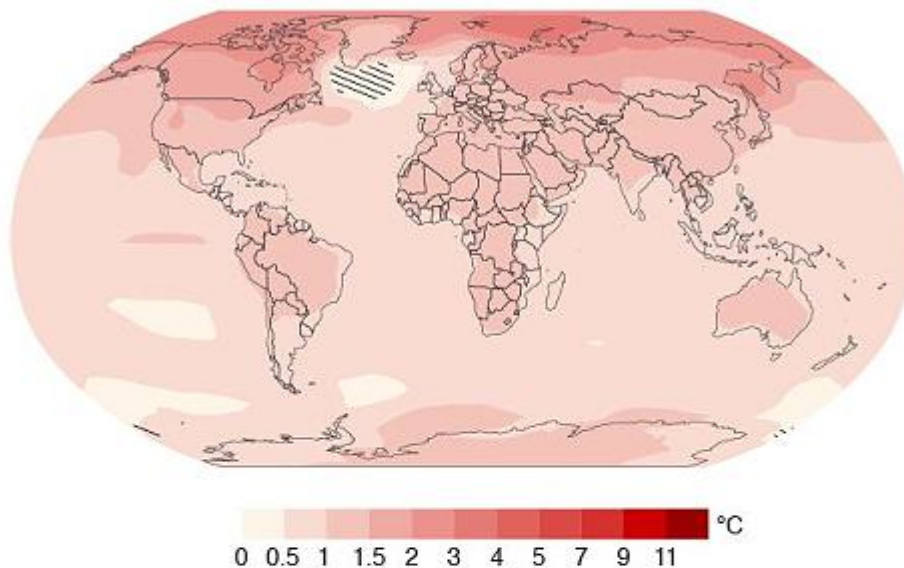

noted. But the best models, according to this test, gave an answer of 4.8 degrees Celsius (8.64 degrees Fahrenheit), plus or minus 0.4 degrees Celsius.

(Chris Mooney, ^œ[The most accurate climate change models predict the most alarming consequences, study finds](#), *Washington Post*, December 6, 2017)

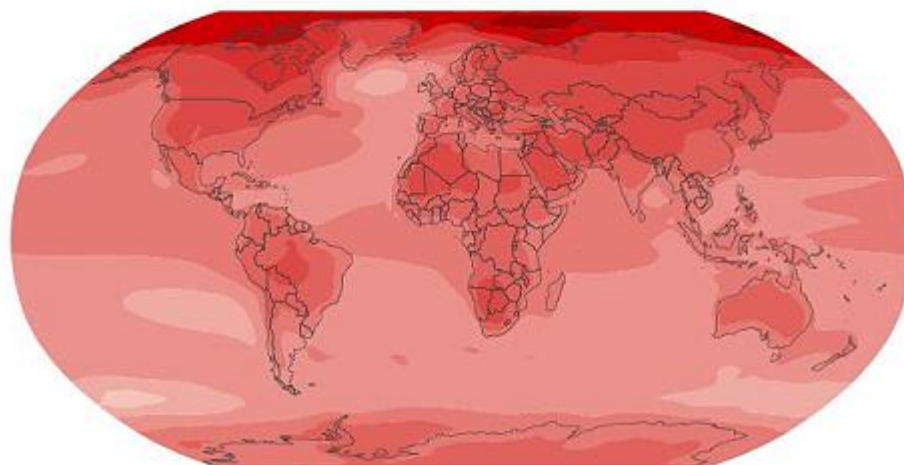

A BBC News summary, on 30 November 2016, provided a clear graphic illustrating the global warming consequences of 'business as usual' through the 21st century:

Projected temperature change (1986–2005 to 2081–2100)

If greenhouse gas emissions peak between 2010 to 2020 and then decline substantially (RCP2.6).

If greenhouse gas emissions continue to rise throughout the 21st century (RCP8.5)

Source: International Panel on Climate Change - Fifth Assessment Report (AR5)

(Mark Kinver, ^œ[Earth warming to climate tipping point, warns study](#), *BBC News, Science & Environment*, 30 November 2016)

The *National Oceanic and Atmospheric Administration (US)* ^œ[Climate site](#) has described the impact of a global temperature rise of 4 or more degrees Celsius. A ^œ[UK Met Office interactive world map](#) shows the catastrophic impact of a global temperature rise of 4 degrees Celsius on a variety of

factors including agriculture, marine life, fires, weather patterns, and health.

A comprehensive assessment of both global and US focused climate trends, ^œ[Climate Science Special Report \[CSSR\]: Fourth National Climate Assessment](#), has been prepared by the US National Oceanic and Atmospheric Administration (NOAA) in collaboration with three other agencies (the National Aeronautics and Space Administration [NASA], and the Department of Energy [DOE]). As the Executive Summary explains:

The climate of the United States is strongly connected to the changing global climate. The statements below highlight past, current, and projected climate changes for the United States and the globe.

Global annually averaged surface air temperature has increased by about 1.8°F (1.0°C) over the last 115 years (1901-2016). This period is now the warmest in the history of modern civilization. The last few years have also seen record-breaking, climate-related weather extremes, and the last three years have been the warmest years on record for the globe. These trends are expected to continue over climate timescales....

Global average sea levels are expected to continue to rise - by at least several inches in the next 15 years and by 1-4 feet by 2100. A rise of as much as 8 feet by 2100 cannot be ruled out. Sea level rise will be higher than the global average on the East and Gulf Coasts of the United States....

The magnitude of climate change beyond the next few decades will depend primarily on the amount of greenhouse gases (especially carbon dioxide) emitted globally. Without major reductions in emissions, the increase in annual average global temperature relative to preindustrial times could reach 9°F (5°C) or more by the end of this century. With significant reductions in emissions, the increase in annual average global temperature could be limited to 3.6°F (2°C) or less.

The global atmospheric carbon dioxide (CO₂) concentration has now passed 400 parts per million (ppm), a level that last occurred about 3 million years ago, when both global average temperature and sea level were significantly higher than today. Continued growth in CO₂ emissions over this century and beyond would lead to an atmospheric concentration not experienced in tens to hundreds of millions of years. There is broad consensus that the further and the faster the Earth system is pushed towards warming, the greater the risk of unanticipated changes and impacts, some of which are potentially large and irreversible.

(USGCRP, 2017: Climate Science Special Report: Fourth National Climate Assessment, Volume I [Wuebbles, D.J., D.W. Fahey, K.A. Hibbard, D.J. Dokken, B.C. Stewart, and T.K. Maycock (eds.)]. U.S. Global Change Research Program, Washington, DC, USA, 470 pp, doi: ^œ[10.7930/J0J964J6](#))

A World Bank assessment of the impact of 4°C warming through the 21st century gives a bleak description of a 'business-as-usual' future:

*"A 4 degree warmer world can, and must be, avoided - we need to hold warming below 2 degrees," said **World Bank Group President Jim Yong Kim**. "Lack of action on climate change threatens to make the world our children inherit a completely different world than we are living in today. Climate change is one of the single biggest challenges*

facing development, and we need to assume the moral responsibility to take action on behalf of future generations, especially the poorest."

The report says that the 4°C scenarios are potentially devastating: the inundation of coastal cities; increasing risks for food production potentially leading to higher under and malnutrition rates; many dry regions becoming dryer, wet regions wetter; unprecedented heat waves in many regions, especially in the tropics; substantially exacerbated water scarcity in many regions; increased intensity of tropical cyclones; and irreversible loss of biodiversity, including coral reef systems.

"The Earth system's responses to climate change appear to be non-linear," points out PIK Director, John Schellnhuber. *"If we venture far beyond the 2 degrees guardrail, towards the 4 degrees line, the risk of crossing tipping points rises sharply. The only way to avoid this is to break the business-as-usual pattern of production and consumption."*
([New Report Examines Risks of 4 Degree Hotter World by End of Century](#), World Bank, Press Release, November 18, 2012)

The consequences for the world in which we live are already being written into the environments we share. Substitute 'Western capitalist' for 'Ozymandias' and Shelley's poem says it well:

I met a traveller from an antique land,
Who said - "Two vast and trunkless legs of stone
Stand in the desert. . . . Near them, on the sand,
Half sunk a shattered visage lies, whose frown,
And wrinkled lip, and sneer of cold command,
Tell that its sculptor well those passions read
Which yet survive, stamped on these lifeless things,
The hand that mocked them, and the heart that fed;
And on the pedestal, these words appear:
My name is Western Capitalist, King of Kings;
Look on my Works, ye Mighty, and despair!
Nothing beside remains. Round the decay
Of that colossal Wreck, boundless and bare
The lone and level sands stretch far away."

Chapter 12: 🌟 Participatory Democracy: It is time to Reconstitute The Commons

📅 (14/03/24)

(16/02/22) (19/07/23) (23/09/23) (24/09/23) (25/09/23) (08/12/23)

All people are created equal, they are endowed by their Creator with certain unalienable Rights, among these are Life, Liberty and the pursuit of Happiness.

- To secure these rights, Governments are instituted among People, deriving their just powers from the consent of the governed,
- Whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness.

There is nothing mysterious about the foundations of a healthy and strong democracy. The basic things expected by our people of their political and economic systems are simple. They are:

- The right of a useful and remunerative job in the industries, or shops or farms or mines of the nation;
- The right to earn enough to provide adequate food and clothing and recreation;
- The right of every farmer to raise and sell his products at a return which will give him and his family a decent living;
- The right of every business man, large and small, to trade in an atmosphere of freedom from unfair competition and domination by

- monopolies at home or abroad;
- The right of every family to a decent home;
- The right to adequate medical care and the opportunity to achieve and enjoy good health;
- The right to adequate protection from the economic fears of old age, sickness, accident and unemployment;
- The right to a good education.

A Wordy Tendentious Prologue... 🐼

 (07/12/23) (30/04/24)

Before launching into this topic we need to understand and genuinely accept that whatever we say is only applicable within our own primary ideological communities. We cannot devise universally 'best', or even more equitable, models for governing life in other [primary ideological communities](#).

The 'educational' institutions of 'developed' nations. almost without exception, believe in a universally held 'objective reality' world. That world is a phantasm!

Unfortunately, ['developed' community discussions on the topics of 'democracy' and 'capitalism'](#). all-too-often presume the Western World's stress on individualism, independence, competition and ahistoricity

This limits such discussions to current policies and practices as though they could be understood without reference to the inescapable, historically fashioned, [primary and secondary ideologies](#) which inevitably frame the understandings of participants.

Whether we like it or not, no forms of governance and no forms of 'morality' can exist outside of the ideological frames within which we exist. This, ultimately, is what makes ['multipolarity'](#) inescapable and limits the applicability of societal constructs to communities which share the primary and secondary ideologies of those who construct them.

['Unity in diversity' and 'harmony without uniformity' presume a shared 'universe' within which all entities are united](#) but the best we can possibly hope for - and the best we should always limit ourselves to in explaining our understandings to those living in variant ideological realities - is congruence!

Our hope must be that our explanations of what we consider, from our perspective, to be models to which we should aspire, are grasped and reinterpreted to fit their realities. But we have no right to compel change to fit our realities!!

The possible implementation of the presumptions and purposes of our understandings must be left to those who are able to adapt them to their own ideological understandings!

Any attempt to impose such constructs on communities which do not hold fundamentally similar historically developed ideological frames can only result in confusion and disruption of those communities. [This is what lies at the heart of the turmoil and resentments of the 21st century.](#)

Western peoples, not aware that they hold idiosyncratic understandings of reality, make and attempt to develop 'universally' applicable societal constructs. This is an exercise in futility.

We are not Gods. We cannot step outside the ideological frames bequeathed to us by our communities. And, of course, human beings bequeathed ideological frames by their historically dissimilar communities cannot simply relinquish them and live by the ideological frames of so-called 'developed' societies.

What we discuss in this section can only be applicable in societies which share the ideological frames of reality held by us! And, it is highly possible that you and I do not share the same understandings of 'objective reality'. So, please, do not allow yourself to be uncritically swayed by anything I argue or suggest!

All I can say is 'Please, Think For Yourself!!!'

What has been bequeathed to us all and can be universally asserted is: God (or whatever you might or might not believe grants intelligent agency to human beings) made us intelligent for a reason!! I find it a source of constant amazement that, despite our very different ideological framings, we, nonetheless, can make sense of each other's ideas (though, some more than others!)

So, with that wordy, tendentious prologue:...

There is nothing more important in a capitalist democracy than the preparation of its people for their duties of government.⁷⁸²

Nobody is 'born to govern';

Nobody 'instinctively' understands the responsibilities of citizenship;

Nobody has an inherent 'right to rule' which supersedes the rights of others;

Nobody 'deserves' 'wealth'; and

Nobody deserves 'poverty'!

And all of this *needs to be taught* to ensure the health and wellbeing of all.

If the people are not taught their responsibilities they will become victims of the unscrupulous; their communities grotesquely distorted to benefit those 'who profit from profound inequality, injustice, oppression, exploitation, war and ecocide'.

Caitlin Johnstone has explained it:

The official story is that we live in a free democracy where our teachers tell us the truth about our nation, our government and our world when we are children, and then the free press continue telling us the truth about our nation, government and world when we are grown, and then every few years we have free and fair elections in which we use this truthful information to make decisions about which politicians and policies to vote for, and it is only by pure coincidence that what we vote for just so happens to benefit the most wealthy and powerful people on the planet.

In the official story, the democratic process consistently fails to let us progress beyond a status quo of profound inequality, injustice, oppression, exploitation, war and ecocide because that's simply how people are voting in their free and fair elections. The official story maintains that this occurs because the populations of all free democracies coincidentally happen to be organically divided into two ideologically opposed camps of equal size, creating a political deadlock

which just so happens to benefit the people who profit from profound inequality, injustice, oppression, exploitation, war and ecocide.

Per the official story, society is driven by the majority, and it is only by an immensely widespread and startlingly consistent series of coincidences that society remains perpetually shaped in a way that benefits a small minority of rich and powerful individuals....⁷⁸³

Beware those who insist that the responsibility of 'The People' is merely to 'vote' for a leader: they are subverting Democracy and a New Deal for disenfranchised citizens⁷⁸⁴. *It is the responsibility of 'The People' not merely to vote, but to ensure their fundamental rights.*

In 2021 US President Biden, in the foreword to his first explanation of his Administration's National Security Strategy entitled *Interim National Security Strategy Guidance*, provided an explanation of the importance of 'Democracy' in advancing 'United States Interests':

...[O]ne thing is certain: we will only succeed in advancing American interests and upholding our universal values by working in common cause with our closest allies and partners, and by renewing our own enduring sources of national strength.

That begins with the revitalization of our most fundamental advantage: our democracy. I believe we are in the midst of an historic and fundamental debate about the future direction of our world. There are those who argue that, given all the challenges we face, autocracy is the best way forward. And there are those who understand that democracy is essential to meeting all the challenges of our changing world.

I firmly believe that democracy holds the key to freedom, prosperity, peace, and dignity. We must now demonstrate - with a clarity that dispels any doubt - that democracy can still deliver for our people and for people around the world. We must prove that our model isn't a relic of history; it's the single best way to realize the promise of our future. And, if we work together with our democratic partners, with strength and confidence, we will meet every challenge and outpace every challenger.

(President Joseph R. Biden, Jr, ^{ae}[*Interim National Security Strategy Guidance*](#), *US White House Briefing Room*, March 03, 2021)

But, of course, such a proclamation requires close scrutiny.

What is Biden referring to when he speaks of 'our democracy'?

Why does he simplistically presume that there are only two forms of government: 'Democracy' or 'Autocracy'?

And, what exactly will the promotion of his version of democracy do for all those communities and nations subjected to his 'democratic' impulses?

Given that Biden himself, in his 2019-2020 presidential campaign, had to raise some [\\$1.3 billion from private sources](#) to fund his campaign, to whom is the newly inaugurated US President beholden during the next four years?

Is he speaking of 'democracy' as government *of, by, and for The People* or is he speaking of that *faux democracy* - the [plutocratic alternative of elitist elective government](#): the legacy of citizens engrossed in bread and circuses?

Jonathan Schlefer explained:

Political elites turn out to make poor guardrails for democracy, not least because the top line in their job description is pursuing power. Only angels could be relied on to never abandon norms of toleration and restraint in that pursuit, and even politicians' most fervent admirers have never called them that.

In the United States in recent decades, Republican leaders have abandoned democratic norms particularly egregiously, but Democrats have pitched right in.

What's to stop them?

"We the people," it turns out. *A citizenry with less interest in power than in preserving democracy is the safeguard of last resort.*

Appearances to the contrary, the problem of polarization in the United States began not with voters but with political elites who drove their bases to extremes. The more directly responsive government can be made to the people, the safer democracy will be.

Americans hear a lot about increasing ideological polarization as the source of the country's political troubles. They have their party elites to thank for this problem.

(Jonathan Schlefer, ^œ[The Real Guardrails of Democracy Are Its Citizens](#): Elites Are Driving Polarization That More and Better Representation Could Fix, *Foreign Affairs*, March 15, 2021 - [my emphases])

As President Franklin Roosevelt of the US explained of the *New Deal* objectives, *these **rights*** underpin and provide the fundamental rationale for a [sovereign nation's infrastructural Commons](#). They *must be freely available* to all of its current and future citizens - who are, indeed, responsible for ensuring them into the future for all within the nation.

No democracy can survive long if its citizens succumb to self-indulgent hedonism and ignorant disengagement from the public responsibilities of citizenship. As Roman rulers learned more than two thousand years ago, to disenfranchise citizens, engross them in ^œ[bread and circuses](#).

Perhaps the greatest threat to truly participatory democracy over the last century has been wrapped within the infotainment/ pseudo-social complexes of the age.

I well remember social activists during the 1950s who mounted forlorn campaigns against the emergence of television entertainment during a period in which most of the entertainment supported by the developing television networks was, by 21st century standards, both morally and pornographically benign.

Their major prediction was that as the forms of entertainment matured they would become increasingly immoral and pornographic in the drive to attract and retain audiences. And, if one compares the inane programming of the 1950s with the programming of this century it is hard to dispute their predictions.

What they failed to predict however was that as entertainments became increasingly sophisticated they would absorb more and more of the time and energy of audiences; that whole populations would find themselves captivated, watching entertainments and engaging in 'interactions' which might or might not be 'informative' and/ or 'participatory', but are nonetheless similar to the 'circuses' of Rome.

The pseudo-social 'interactive' platforms of the 21st century effectively lull their participants into a false sense of social 'activism' which seldom leads to participation in vibrant neighborhoods and communities engaged in that 'participatory democracy' which ensures government of the people by the people and for the people⁷⁸⁵.

True democracy is a 'bottom-up' form of government. Government of the people, by the people, for the people presumes a 'people' who:

1. Understand what it means to live in democratic communities and a democratic society;
2. Have been educated to understand their responsibilities and the implications of their decisions/actions;
3. Take their responsibilities seriously.
and, equally importantly,
4. Clearly understand both the [nature and logic of credit creation](#) and circulation in a democratic capitalist nation

In a democratic state, the preparation of citizens for their duties of government cannot be left to 'private enterprise' ⁷⁸⁶. It must, by definition, be a central feature of 'The Commons'⁷⁸⁷ - freely available to all of its current and future citizens, and centrally focused not on 'careers' within the private realm but on the civic responsibilities of citizenship - at all levels.

The problem for any system of government focused on 'the people' - whatever the economic organization opted for by those people - is that it assumes competent political leadership but does not, in fact, educate those who assume political office for their responsibilities. The consequence is that political office goes, not to those most qualified for it, but to those who are able to promote themselves most effectively. One gets a Clinton, a Bush, an Obama, a Trump or a Biden as one's president!

In order to ensure effective government one needs a cadre of people educated for the purpose. Alex Cox, in a comment on a short essay by Michael Hudson has described the British dilemma and suggested a few safeguards in addressing it:

In England the aspirant ruling class move from Eton to Oxford to the Inns of Court to Parliament - in each instance, inhabiting an other-worldly, faux-gothic environment, full of wealthy people.

There is absolutely no notion of public service at any stage. They are learning how to serve the oligarchy and massively enrich themselves.

The idea of the Philosopher King is very interesting - not in terms of kings, which we don't need - but of Philosopher Parliamentarians.

What if anyone standing for office had to renounce the accumulation of personal wealth? Aspirant MPs or Senators would agree simply to legislate (itself an incredible privilege) and then to retire on a modest pension and tend their allotments.

(Alex Cox, Comment on ^œ[Michael Hudson Asks Our Readers: If Democracy Winds Up Creating Financial Dominance, What Do We Call China? *NakedCapitalism*, April 10, 2021\)](#)

If citizens in a democracy need to be educated to understand their responsibilities and the implications of their decisions/actions so should those who aspire to political office. As Cox put it, there is a real need in a bottom up democracy for 'Philosopher Parliamentarians' who do not

promote themselves but are promoted by the processes of civic education (with the necessary 'checks and balances' determined by its citizens) which sustain the democracy.

Failure to take civic education seriously will, inevitably, expose democratic societies to the exploitative manipulations of those whose myopic goals in life are self-promotion and the [self-interested accumulation of 'wealth'](#), whatever the cost to others.⁷⁸⁸

A comment on a blog posting entitled 'They Go Together: Freedom, Prosperity, and Big Government' on the blog site *Naked Capitalism* puts it in a nutshell:

This article reminds me of that most ideal and wonderful of all statements about what our government should be: the Preamble to the Constitution:

"We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America."

We the People... .that's a pretty big government!

Do you see anything in the Preamble about the right to get filthy rich? Or perhaps protection of corporations at the expense of everything else? Or perhaps "Corporations are people too?"

I think the truth has been staring us in the face in this country all along but most of us have had the blinders of greed and self interest strapped onto us from a very early age....

([@justanotherprogressive](#), April 28, 2017)

'Democracy', in the early 21st century, is in urgent need of root and branch reformation. The [hollowed out shell of democratic government](#) has been hijacked by the descendants of 19th and early 20th century free-marketeters.

New Deal democracy has, [over the past sixty years and more](#) (much of my adult lifetime) been [quite consciously remodeled](#) to serve the interests of those who believe themselves to be the 'wealthy elite'. Newton Finn, in a comment on an essay by Peter Dorman, put it well:

There is much to be said for striving to understand the relatively recent history which has brought us to the current social/ economic/ environmental crisis, but there's also something to be said for a much longer view.

Writing in the late 19th Century, delineating the pitfalls of capitalism and anticipating the global plutocracy looming in the distance, Edward Bellamy talked about "the rule of the rich," ⁷⁸⁹ which had been in place since the demise of the early agrarian village. Whether as slaves of ancient empires, serfs of feudalism, or wage-slaves of capitalism, the impoverished many had served the interests of the wealthy few throughout recorded history, and the pattern of submission to wealth and its associated power had accordingly become deeply ingrained into human consciousness, as the way things simply are and are meant to be.

The only antidote to these millennia of social conditioning, Bellamy believed, was the idea of democracy, which had made a fitful

appearance among the wealthy in ancient slave societies, but had really been born, albeit only partially and ideally, in the American Revolution.

Read again the Preamble to the Declaration of Independence - give the words a liberal, living interpretation as opposed to a strict historical construction - and Bellamy's fundamental point becomes as self-evident as the sacred equality of all persons, the inherent rights which flow from this equality, and purpose of government as an instrument, created by the people, to secure that equality which both undergirds and expresses those inherent rights.

In short, the polar opposite, the mortal enemy, of the consummate "rule of the rich" which we now call neoliberalism, is democracy - not the faux democracy we know today but full-blown democracy, which embraces not only the political arena but extends itself boldly into the crucial economic arena as well.

(Newton Finn, Comment on an essay by Peter Dorman, ^œ[Neoliberalism as Structure and Ideology](#), posted on the *Naked Capitalism* site by Yves Smith, December 29, 2018)

Participatory Democracy 🇺🇸

Preparation of citizens for their duties of government is a prime responsibility of the State and it cannot be allowed to be subverted to serve special interests ⁷⁹⁰. As [Franklin Roosevelt explained](#), echoing both Thomas Jefferson and Abraham Lincoln's Gettysburg Address,

the liberty of a democracy is not safe if the people tolerate the growth of private power to a point where it becomes stronger than their democratic state itself. That, in its essence, is Fascism - ownership of Government by an individual, by a group, or by any other controlling private power.

Thomas Jefferson put it in a nutshell:

I know no safe depository of the ultimate powers of the society but the people themselves; and if we think them not enlightened enough to exercise their control with a wholesome discretion, the remedy is not to take it from them but to inform their discretion by education. This is the true corrective of abuses of Constitutional power.

(^œ[Thomas Jefferson to William Charles Jarvis](#), September 28, 1820)

The plutocratic alternative: Elitist Elective Government: (The legacy of citizens engrossed in bread & circuses) 🇺🇸

 (29/04/24)

[Stephen Morris](#) summed it up, "Democracy is *not about 'electing leaders'*. That is elitist 'elective' government". This misunderstanding and subversion of bottom-up democracy is "the essential flaw in Popper's philosophy of Platonic Paternalism, the belief system embraced by Elites throughout the developed world."

As Popper explained of his 'theory of democracy':

Please note that this discounts the notion of rule by the people, and even of popular initiative. Both are replaced with the very different idea of *judgement by the people*.

(Karl Popper, 2000, *The Lessons of This Century*. London: Routledge, p. 72).⁷⁹¹

Bill Black put it well:

Libertarians glorify von Hayek's bigoted glorification of elites as our moral superiors who have a right to rule and plunder our Nation.

œTyler Cowen calls plutocracy and pervasive plunder a "hyper-meritocracy," but it is a rule by the most unethical for the most venal of purposes and it is the greatest enemy of merit and justice

Neil Gabler, summing up US President Trump's first year in the job, has illustrated Black's assertion⁷⁹²:

Trump is certainly an authoritarian, but he is more of a tinhorn dictator, a tiny, negligible man who, rather than inflating himself with the nation's grandeur, has managed to deflate the nation with his own insipidness. Thanks to him, America is now a banana republic...

Now she is hopelessly diminished - a wealthier version of the corrupt nations in the developing world that we used to ridicule. And we owe it all to Donald Trump for making America small again.

(Neil Gabler, œAmerica the Banana Republic: Thanks to Trump the tinhorn dictator and those who elected him, this country is no longer a beacon of freedom, but a laughingstock, *Moyers & Company*, November 29, 2017)

Paul Krugman (long before President Trump loomed as an incredible presidential candidate in US politics) in a 2008 *New York Times* piece entitled 'OK, we are a banana republic' summed up the direction in which the nation was headed:

...[W]hat we now have is non-functional government in the face of a major crisis, because Congress includes a quorum of crazies and nobody trusts the White House an inch.

As a friend said last night, we've become a banana republic with nukes.

(Paul Krugman, œOK, we are a banana republic, *New York Times*, September 29, 2008)

In June 2020, after decades in which those who have seized the reins of wealth and power in the United States have highjacked its democracy and disenfranchised more than 70% of its population, to paraphrase Cornel West, a deep depravity exists within the neoliberal capitalist system of the 21st Century in the United States that dominates both major political parties.

Over that time there has been a failure of both political and intellectual understanding and leadership in the nation. Those who might have made a difference have been co-opted by mega-wealth to either actively promote its interests or mute and intellectualize their criticisms. Krugman concludes:

I don't think it's an exaggeration to say that America as we know it is on the brink.

How did we get here? The core story of U.S. politics over the past four decades is that wealthy elites weaponized white racism to gain political power, which they used to pursue policies that enriched the already wealthy at workers' expense.

Until Trump's rise it was possible - barely - for people to deny this reality with a straight face. At this point, however, it requires willful blindness not to see what's going on....

Now, I don't think Trump will actually succeed in provoking a race war in the near future, even though he's clearly itching for an excuse to use force. But the months ahead are still likely to be very, very ugly.

After all, if Trump is encouraging violence and talking about military solutions to overwhelmingly peaceful protests, what will he and his supporters do if he looks likely to lose November's election?

(Paul Krugman, ["Trump Takes Us to the Brink: Will weaponized racism destroy America?"](#), *New York Times*, June 1, 2020)

But, perhaps, the center of Western Capitalism is, in this century, heading toward a future, not of dictatorship or oligarchic rule but of dystopia, a society coming apart at its seams with an accelerating breakdown in social and governmental cohesion.

William Du Bois, more than a century ago, eloquently described the deep, seemingly unbridgeable, divide between those who discriminate and those discriminated against ⁷⁹³:

Between me and the other world there is ever an unasked question: unasked by some through feelings of delicacy; by others through the difficulty of rightly framing it. All, nevertheless, flutter round it. They approach me in a half-hesitant sort of way, eye me curiously or compassionately, and then, instead of saying directly, How does it feel to be a problem? they say, I know an excellent colored man in my town; or, I fought at Mechanicsville; or, Do not these Southern outrages make your blood boil? At these I smile, or am interested, or reduce the boiling to a simmer, as the occasion may require. To the real question, How does it feel to be a problem? I answer seldom a word...

Nations Reap what they Sow:
In 2024, the chickens are coming home to roost 🐔

 (26/02/17) (17/07/24)

As Yeats put it,

Things fall apart; the centre cannot hold;
Mere anarchy is loosed upon the world'.

Jon Queally has summarized what is happening well:

Harvard University philosophy professor Dr. Cornell West appeared on CNN Friday night amid nationwide protests over the police killing of George Floyd in Minneapolis, Minnesota and offered a searing indictment not just of white supremacy, the neo-fascism of President Donald Trump, and a criminal justice system that repeatedly brutalizes the poor and people of color - but also of a deep depravity that exists within the neoliberal capitalist system of the 21st Century in the United States that dominates both major political parties.

As protests raged in Minneapolis, outside Trump's White House, and U.S. cities nationwide - including Atlanta, Chicago, New York, Cleveland, and Oakland - West told CNN's Anderson Cooper in an interview, "I think we are witnessing America as a failed social experiment."

"What I mean by that," explained West, "is that the history of black people for over 200 and some years in America has been looking at America's failure. Its capitalist economy could not generate and deliver in such a way that people could live lives of decency. The nation-state, its criminal justice system, its legal system could not generate protection of rights and liberties. And now our culture, of course is so market-driven - everything for sale, everybody for sale - it can't deliver the kind of nourishment for soul, for meaning, for purpose."

The prevailing ideologies have become more and more clearly defective; increasingly clearly eroding the democratic values of the 'New Deal'; transferring wealth and power to a small plutocratic group (let's not call them 'an elite') at the expense of more than 90% of the population.

West explained the current anger over Floyd's murder by police - one of whom, officer Derek Chauvin, was arrested Friday and charged with 3rd-degree murder and manslaughter - adds to a "perfect storm" of multiple failures and inequities that pre-exist under an American imperial system that people like [Martin Luther King, Jr. and others have been warning about](#) since the middle of last century.

"When I saw those pictures there of Atlanta," West said, "you could see Brother Martin right there in Atlanta, saying: 'I told you about militarism. I told you about poverty. I told you about materialism. I told you about racism in all of its forms. I told you about xenophobia.' And what you're seeing in America is those chickens coming home to roost. You are reaping what you sow. And in this instant, you have Brother George - it is so clear - it was a lynching at the highest level. Nobody can deny it."

(Jon Queally, staff writer, [Cornel West Says 'Neo-Fascist Gangster' Trump and Neoliberal Democrats Expose America as 'Failed Social Experiment'](#), *Common Dreams*, May 30, 2020)

[What is done elsewhere, sooner or later, comes home to roost!](#) The United States is not an exception to this rule. There are many nightmares which, over time, are going to find their expression in the nation which has perpetrated them in so many regions of the world.

Oona Hathaway has explained it well:

For the Rest of the World, the U.S. President Has Always Been Above the Law: Americans Will Now Know What a Lack of Accountability Means

The U.S. Supreme Court's decision on former President Donald Trump's claims of criminal immunity has provoked grave warnings about a new expansion of presidential power. On July 1, the Court ruled 6 - 3 along partisan lines that presidents are immune from criminal prosecution for "official acts" but found that they may still be prosecuted for unofficial acts. "The Court effectively creates a law-free zone around the President," wrote Justice Sonia Sotomayor in her dissent. "In every use of official power, the President is now a king above the law."

Many commentators have echoed her critique. The ruling "jettisons the long-settled principle that presidents, like all others, are subject to the operation of law," observed the legal scholar Kate Shaw. "If the president is a king, then we are subjects, whose lives and livelihoods are only safe insofar as we don't incur the wrath of the executive," warned the New York Times columnist Jamelle Bouie. "If Trump, as commander in chief, ordered his troops to assassinate somebody or

stage a coup, that would seem to fall within the absolute immunity provision of the court's decision," explained the legal scholar Cheryl Bader. Judge Aileen Cannon's decision on July 15 to dismiss the charges against Trump for mishandling classified documents, while likely to be appealed and overturned, has added to the chorus of concerned voices.

What most analysts have failed to note, however, is that this lack of legal accountability for decisions by the U.S. president, including decisions to direct the military to use lethal force, is nothing new. It has long been the reality for most of the world outside the United States. For decades, American presidents have waged illegal wars, plotted to assassinate foreign leaders, unlawfully detained and tortured people, toppled democratic governments, and supported repressive regimes without any possibility of legal accountability in either domestic or international courts.

In the process, the [fundamental infrastructures of a democratic capitalist society](#) have been allowed to [deteriorate and decay](#) and the political and legal structures have been warped to serve mega-wealth which sees no other purpose in their preservation.

Although people all over the world have suffered from these unlawful acts, Americans have lived in a bubble - a bubble this Court decision has finally burst. Indeed, what is so frightening about this decision is that it has the potential to make the president's actions within the United States just as unchecked as they are outside it...

(Oona A. Hathaway, ["For the Rest of the World, the U.S. President Has Always Been Above the Law: Americans Will Now Know What a Lack of Accountability Means,"](#) *Foreign Affairs*, July 16, 2024)

And on the last day of May, 2020, the ["spontaneous, contagious civil unrest"](#) and destructive demonstrations across the nation in response to callous acts of police brutality suggest that anarchy looms in a nation primed to implode.

Sam Pizzigati has described what is happening:

The United States is becoming, commentators have begun to contend, a "failed state." We don't, to be sure, have warlord gangs speeding through our neighborhoods, brandishing automatic weapons out of open-top jeeps. But we do have fanboys of our nation's top elected leader carrying long guns into legislative chambers and screaming red-faced at lawmakers they despise.

"We are one trigger-pull away," laments veteran Mideast journalist Lucian Truscott IV, "from what happens every day in places like Kabul and Mogadishu and Tripoli."

Our core institutions, adds Jacobin editor Seth Ackerman, betray "a deep lack of administrative capacity," be those institutions the bureaucracies that deal with safety-net benefits or the mail or even elections. State unemployment offices run on obsolete 1960s-era software that only "old retired former programmers" know how to fix.

The corona pandemic has put a spotlight on that obsolete software - and so much more.

"The crisis demanded a response that was swift, rational, and collective," notes George Packer in the Atlantic. "The United States reacted instead like Pakistan or Belarus - like a country with shoddy

infrastructure and a dysfunctional government whose leaders were too corrupt or stupid to head off mass suffering."

So who to blame? Donald Trump makes an obvious and deserving target. But the failures of our ruling order predate his troubled and reckless administration. Our "chronic ills" - everything from "a corrupt political class" to a "heartless economy" - have gone, Packer points out, "untreated for years."

How can we halt our national descent into full-bore "failed state" status? Taking a moment to contemplate how a "successful state" operates might be a good place to start.

(Sam Pizzigati, ⁹⁰['Failed State' Status Here We Come?](#) Societies that tolerate deep divides in income and wealth, new research suggests, invite pandemic disasters, *Inequality*: Blogging Our Great Divide, May 29, 2020)

Western states have lost the plot. [Education has been subverted](#) to preparing people, not for the duties of citizenship but for private purposes. In a democratic state, civic responsibilities must always take precedence over private responsibilities. As Alexis de Tocqueville (1835) explained of the early 19th century US communities he observed:

In no country in the world has the principle of association been more successfully used or applied to a greater multitude of objects than in America. Besides the permanent associations which are established by law under the names of townships, cities, and counties, a vast number of others are formed and maintained by the agency of private individuals...⁷⁹⁴

Democracy is *not* a Spectator Sport 🇺🇸

 (14/03/17) (18/05/18) (23/10/18)

The government of a 21st century democratic state is complex. None of us (including those venal 'hyper-meritocratic elites') is born with an ability to understand our responsibilities within that state.

It is the responsibility of the state itself to ensure that understanding.

It is the responsibility of every citizen to ensure that the way in which those state responsibilities are pursued is centrally focused on empowering all citizens and ensuring that they both understand and take their responsibilities seriously.⁷⁹⁵

As has been said,

Democracy is not a spectator sport. If we don't participate in it, it ceases to be a democracy.

But, it does require all participants to understand the possibilities of/for involvement within their local, regional and national civic structures and their varied responsibilities within them if it is to be successful⁷⁹⁶. Thomas Jefferson, writing to George Wythe, put it clearly:

Preach, my dear Sir, a crusade against ignorance; establish and improve the law for educating the common people. Let our countrymen know that the people alone can protect us against these evils, and that the tax which will be paid for this purpose is not more than the thousandth part of what will be paid to kings, priests and nobles who

will rise up among us if we leave the people in ignorance...

œ(Letter from Thomas Jefferson to George Wythe, 13 August 1786)

Franklin Roosevelt explained his understanding of the 'paramount functions of the schools in a democracy':

Democracy cannot succeed unless those who express their choice are prepared to choose wisely. The real safeguard of democracy, therefore, is education. It has been well said that no system of government gives so much to the individual or exacts so much as a democracy.

Upon our educational system must largely depend the perpetuity of those institutions upon which our freedom and our security rest. To prepare each citizen to choose wisely and to enable him to choose freely are paramount functions of the schools in a democracy.

(Franklin D. Roosevelt: "œMessage for American Education Week," September 27, 1938. Online by Gerhard Peters and John T. Woolley, *The American Presidency Project*)

Their education and training should predispose them to democratic activism, or, perhaps, more appropriately, as Al Giordano (2009) argued, to democratic *organizing*.⁷⁹⁷

One of the important functions of government in democratically organized capitalist societies is administration, development and maintenance of what, under feudalism, was termed 'the commons'. In non-capitalist societies the commons, as [Ganshof has suggested](#), were not *owned* by *anyone*. They were resources to which all 'free' persons were entitled, without any attempt to ascribe ownership.

This did not mean, as the simplistic 'tragedy of the commons' implies, that the commons were subjected to rampant competitive individualized exploitation. Rather, as [explained elsewhere](#), long-term utilization of the commons presumes communities organized in terms of an '[interdependent self](#)', not an '[independent self](#)'⁷⁹⁸.

Of course, it was this presumption of common, 'interdependent' responsibility - which did not need to be legislated - which made it possible for Western Europeans to plant their flags on 'unclaimed' and 'unowned' territory and [pronounce ownership](#). It was this which [allowed them to proclaim Australia - and many other more heavily populated regions of the world - terra nullius](#) : unowned land (and, of course, resources).

The Creation and Circulation of Credit in a capitalist democracy 🐦

Stripped down to its bare essentials, the creation and circulation of credit in a capitalist democracy starts with the funding of all public commons needs through [creation of credit by the central reserve authority](#)⁷⁹⁹. That credit, inevitably, will flow through to the private sector which will be invigorated by the injection of the funds. And, as is the nature of private economic activity, that [credit will eventually pool within the 'top end of town'](#): in the coffers of major corporations and other private entities.

The only limitations on the funding of the credit requirements of public commons institutions, processes and activities are those of [resource availability](#) and the [will of government to take responsibility](#) for maintaining economic stability through [well-crafted taxation policies](#) which remove excess credit from the economy when it has fulfilled its varied purposes. Inevitably, this will require removing surplus credit from extreme accumulations of credit within the private realm.⁸⁰⁰

As was true during the 1950s to early 1970s within most capitalist democracies, extreme wealth must be subject to extreme levels of taxation (for an interactive graph demonstrating this in the US for the period 1936-1980, see: [U.S Individual Income Tax: Tax Rates for Regular Tax: Highest Bracket](#)).

Failure to take taxation responsibilities seriously will, as the world has witnessed since the 1970s, result in [absurd levels of wealth accumulation](#); the [curtailing of public credit creation](#); and the destabilization of both economies and communities ⁸⁰¹.

As has been observed elsewhere, [with great power comes great responsibility](#). The citizens of a democratic capitalist nation need to fully understand the [nature and purpose of such taxation](#).

It was the failure of nations to adequately educate their citizens that led to successful plutocratic challenges to progressive taxation regimes as 'unfair' and penalizing the 'wealth creators' of capitalism. Of course, those 'wealth creators' are actually capitalism's arch credit accumulators and hoarders.

They are the ultimate beneficiaries (through [condensation](#)) of the public credit creation and public funding in which democratic governments engage while ensuring the wellbeing of communities and of the commons institutions, processes and activities funded and supported by government.

And, as is the wont of private 'wealth creators', they strongly believe that government has no right to be funding and developing communal institutions and services. Those are potentially lucrative sources of wealth for private sector 'owners' and should be divested to private individuals within the 'economy', to be 'profitably' developed.

Threat of the Profit-Driven Privatization of Government 🇺🇸

 (31/07/16) (18/08/16) (13/09/16) (14/09/16) (15/09/16) (09/10/16) (28/03/17)

The [division of the world into 'public' and 'private' spheres](#) is uniquely a capitalist enterprise. Everything has an 'owner' with *exclusive* rights to access and use. If one cannot determine a 'private', that is, non-public, owner then, by default it 'belongs' to the 'state': to the 'government'. But, since this is the default, and essentially 'pre-capitalist' state, the government merely holds custodial title until public ownership can be transferred to private entities.

As capitalism has matured, more and more features of the physical, social and intellectual realms have become [recognized as commodities](#) and, therefore, available for divestment to private individuals within the 'economy', to be 'profitably' developed. It is this default capitalist need to convert anything and everything into money-making commodities - objects which can be exclusively exploited for profit by real or artificial individuals - which [enfeebles both social and political life](#) in Western democracies.

Once profit and loss reasoning is employed in the organization of communities or provision/ delivery of government services, "the natural tendency is to confiscate the budget for public goods and extort the captive population". The 'natural' focus of individualized, self-oriented capitalism is on meeting the independent, self-interested, accumulative 'needs and wants' of each interactant in social interactions. The '[natural' focus of interdependence](#)' is the other party in an interaction, rather than the independent needs and wants of the interactants. ⁸⁰²

A focus on 'profit' drives, and justifies, the dismantling of both governmental responsibilities and the presumed obligation of people, as members of democratic communities, to accept ongoing responsibility for the organization and administration of community affairs through what de Tocqueville (1835) called the "principle of association".

True democracy [springs from 'the people'](#). It is, as Lincoln phrased it: "government of the people, by the people, for the people". As Alexis de Tocqueville explained:

In no country in the world has the principle of association been more successfully used or applied to a greater multitude of objects than in America. Besides the permanent associations which are established by law under the names of townships, cities, and counties, a vast number of others are formed and maintained by the agency of private individuals...

The citizen of the United States is taught from infancy to rely upon his own exertions in order to resist the evils and the difficulties of life; he looks upon the social authority with an eye of mistrust and anxiety, and he claims its assistance only when he is unable to do without it. This habit may be traced even in the schools, where the children in their games are wont to submit to rules which they have themselves established, and to punish misdemeanors which they have themselves defined. The same spirit pervades every act of social life. If a stoppage occurs in a thoroughfare and the circulation of vehicles is hindered, the neighbors immediately form themselves into a deliberative body; and this extemporaneous assembly gives rise to an executive power which remedies the inconvenience before anybody has thought of recurring to a pre-existing authority superior to that of the persons immediately concerned.

(Alexis de Tocqueville (1835), ^œ[Democracy in America](#) , Vol. 1, Ch. 12, 'Political Associations in the United States', quoted in Lambert Strether, ^œ[Clinton, Sanders, the American Principle of Association \(and Fascism\)](#), *Naked Capitalism*, July 27, 2016)

So long as capitalism is perceived as the unrestrained conversion of 'public assets' into *exclusive*, private, 'profitable', economic possessions, the *inclusive* social and political 'principle of association' will be diminished and [Roosevelt's claim](#) that "as society becomes more civilized, Government - national, State and local government - is called on to assume more obligations to its citizens" will not 'make sense'.

Government: 'Of The People, By The People' 🇺🇸

 (23/07/17) (29/12/17) (28/09/19) (27/10/23)

Over the past half century, the drive to corporatization⁸⁰³ and [privatization](#) has diminished Western democracies everywhere, but especially in the Western Anglosphere.

Evan Jones (2015) vented his frustration at the myopic determination of Australian politicians to 'managerialise' and privatize the commonweal:

Trashing the public interest

The current crop of polities would rather destroy or sell off a public school or a public park than build one. The public heritage is merely a treasure chest to be plundered.

The dismantling of the vocational training system in Australia is representative of the parlous environment. The cynicism and myopia behind this dismantling - transparently strategic rather than accidental - is diabolical and a shocking indictment of the current political class.

The new era began with [Hawke-Keating federal labour](#). Did Prime Minister Bob Hawke and Treasurer Paul Keating know what they were doing?

... Managerialism? Codswallop. Although managing a sizeable public service is not easy, managerialism did not provide the answer. Politicising the senior executive service a mistake. Ditto contracting out. Contracting out involves not an economising of the public purse but rather the reverse - a legitimisation of carpetbaggers on the public teat. Ditto [public-private partnerships](#). (Note the "commercial in confidence" secrecy that has followed contracting out and public-private partnerships.) Ditto the corporatisation of public enterprises. All these procedures were sold on a variety of lies.

Then came uncritical privatisation. The public has never wanted it, but the public was not (and is not) asked its opinion nor its preferences. (Evan Jones, ⁸⁰[Whence the Commonwealth: The Rise of the Dunces](#), *Independent Australia*, 9 September, 2015)

Both 'new-left' and 'conservative-right' Australian politicians have indulged in the game. Both have displayed a readiness to subject the nation to neoliberal 'managerialism' and privatization. As Jones put it:

The majority of the current crop of people in political office know no history and have no concept of "the public interest". They are either in it for the personal privileges or are there as flunkies for powerful selective interests....

There has to be a redefinition of 'government' as a 'bottom up' expression of the interdependent will of 'the people'⁸⁰⁴. As J. D. Alt has suggested:

... [T]he primary purpose of the state, the strategic mission of the federal government, is to empower the basic units of our social fabric: our households, communities, and local economies. Big businesses and corporations can take care of themselves, and have much to offer and contribute - but it is only by nurturing the health and vigor of the basic units of our society that we can, in fact, create a more perfect union. And this is not a task that big business, pursuing corporate profits, is disposed or interested in undertaking.

Is this position anti-corporate? Am I anti-big business? Only a fool would think or say so. American corporations and businesses which are producing real goods and services - and more power to them - require for their success, above all else, customers with the means to buy those goods and services. And who are those customers? They cannot be any other than the basic units of the social fabric we've been talking about: our households, communities, and local economies.

This is why we are fooling ourselves if we believe that we, as a sovereign nation, cannot or should not pay our households and communities to undertake the things they need to accomplish. And why should we severely limit that support because politicians and economic pundits tell us there isn't "enough money" - when, in fact, our Federal Reserve system creates, out of thin air, trillions of dollars every year to make good the profits of our capitalist system?

Yes! It's true! Where do you think the dollars come from when, at the end of every business day, America's bank accounts are bigger than the day before? Why should we not use that same ability to create money for the "social profits" that will come if we pay our local communities to create the services and infrastructures they need? If we create dollars, at the bat of an eye, to pay for the profits of the car industry, why shouldn't we create dollars to pay towns and neighborhoods to provide their children with pre-school learning and day-care centers?

If we create dollars to pay for the profits of a middle and upper-class house-building industry, why shouldn't we create dollars to pay local communities to build the affordable housing needed by families still trying to climb the economic ladder? All of these payments - profit-making AND not profit-making - accomplish the same thing: they pay people wages to produce particular goods and services that other people need. Why, then, do we say that one is good and the other bad? One is possible and the other is not? Why do we limit ourselves, as a sovereign democracy, to creating money ONLY for those goods and services that generate a profit?

(J. D. Alt, ^œ[The Charade](#), *New Economic Perspectives*, September 12, 2016)

This will give both legitimacy and [necessary support](#) to continuing, grass-roots, *public* responsibility for the [commonweal](#) ; the 'development' of well defined 'public' responsibilities which *cannot*, by definition, be transferred to private entities.

Bill Mitchell, interviewed by Lynn Fries, put it well:

...There are so many things that can be done in a societal sense that don't have anything really to do with advancing the profit potential of corporations - that add value to our lives and our society - which can be undertaken. And so in my view, we have to broaden our concept of worth into social benefits and social costs and consider things not in... private terms but in... social terms.

...There's a whole range of activities then that immediately become productive and worthwhile, that will never be done as an outcome of the calculus of whether it's profitable for private companies or not, and are incredibly beneficial to society.

So once you start thinking like that, a very broad concept, then the options that open up to policy makers and our response to those options in a political sense become quite different to the way we think now.

(William Mitchell, ^œ[Seeking Full Employment Without Falling Prey to Neoliberal Traps](#), *Global Political Economy news & analysis GPEnewsdocs*, September 27, 2023)

In the blog posting below, he has elaborated similar themes (see also this discussion: ^œ[Performing artists bear the brunt of austerity under neo-liberalism](#) (January 4, 2017)).

I do, however, question his suggestion that such community development projects and activities should be funded 'at a minimum wage'. As he cogently argues, *these should not be seen* as 'make-work' jobs, to be displaced at the soonest possible time with 'real work'. Such activities are the stuff of healthy, active democratic communities which contribute primarily to the commonweal rather than profit-driven private enterprise.

I would also question the [designation of such activity as 'work'](#). It seems important that democratic capitalist communities should learn to clearly distinguish between activity aimed at ensuring the commonweal and activity aimed at ensuring profitable private enterprise ('gainful employment')⁸⁰⁵:

... [D]uring the Great Depression, US President Roosevelt's New Deal was introduced as the private sector was in full-scale retreat from job creation. The Public Works Administration (PWA), which was part of the New Deal, created hundreds of thousands of jobs and the work helped restore ageing public infrastructure (such as, roads, dams and bridges).

Many new buildings were constructed during this period (schools, recreational spaces, libraries, hospitals), which have delivered benefits to the generations that followed.

Harry Kelber (2008) wrote that the WPA meant that:

Thousands of unemployed writers, actors, musicians and painters were given an opportunity to earn a modest livelihood from their artistic talents ... and to enrich the lives of countless culturally-deprived citizens. The productions of the WPA Theater Project, for example, entertained a phenomenal audience totaling 60 million people, a great many who had never before seen a play.

(Kelber, H. (2008) '[How the New Deal Created Millions of Jobs To Lift the American People from Depression](#)', *The Labor Educator*, May 9, 2008)

The Tennessee Valley Authority was a huge hydro-electricity project introduced during this period and brought electricity and prosperity to some of the poorest rural areas of the US.

At the time, Kelber (2008) notes that the private electricity providers stridently opposed the challenge to their monopoly control. The upshot was that the project forced them to reduce their power charges.

In general, the dynamism of the public sector at that time caused huge outcries from the capitalists who didn't want challenges to their cosy profit making industries from public sector enterprise.

But societal well-being was unambiguously advanced.

There are many other examples of public sector job creation outcomes that have left valuable legacies over the years across many countries. (Bill Mitchell, [Work is important for human well-being](#), *Billy Blog*, September 14, 2016)

It is through the development of vibrant, interdependently oriented communities that Hardin's (1968) [simplistic](#) '[tragedy of the commons](#)' must be neutered as a free-market capitalist argument for the privatization of 'the commons'.

Unless that happens, Western individuals, ideologically committed to living in a free-market capitalist world, will continue to argue for the transfer of government assets into the private realm and democratic capitalist societies will, inevitably, over time, [devolve from democracy to plutocracy](#).

Chapter 13: 🚀

A 'Perfect' Solution: Hypersonic Warfare (Is **this** the way our world ends?)

The all-American powers-that-be and the arms makers that go with them dream up, produce, and sell weaponry, domestically and internationally, in an unmatched fashion. You'll undoubtedly be shocked, shocked to learn that the top five arms makers on the planet - Lockheed Martin, Boeing, Northrop Grumman, Raytheon, and General Dynamics - are all located in the United States.

(Tom Engelhardt, [∞]Slaughter Central: The United States as a Mass-Killing Machine, *TomDispatch*, April 13, 2021)

An Orwellian 'Newspeak' World

 (25/02/18) (03/04/18) (06/04/18) (16/04/21) (16/04/21) (17/04/21)

 US military spending accounts for more than 50 percent of all federal discretionary spending.

- ★ Responsibility for political oversight of military authorities and activities in the United States has, over the past half-century, been progressively 'streamlined', short-circuiting long-established political safeguards against the possibility of impulsive war making.
- ★ In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex. (Eisenhower (1961))
- ★ The madness of the Cold War policy of 'mutually assured destruction' has, in this 21st century, mutated in the US into a cold, calculated determination to ensure overwhelming military supremacy.
- ★ President Trump, elected US pitchman for Western armaments factories: A multi-billion-dollar arms deal...: "Tremendous investments in the United States."⁸⁰⁶
- ★ Countries in the richest quintile of world population appear to have accounted for about 97% of world arms exports and about 65% of world arms imports.
- ★ Countries in the most democratic quintile of world population appear to have accounted for 92% of world arms exports and about 54% of world arms imports. The most democratic quintile was **the only degree-of-democracy quintile with a positive arms trade balance.**
(US Department of State, [∞][World Military Expenditures and Arms Transfers 2017](#))
- ★ In this brave new borderless world, Western forces, armed and funded as never before, are supported by a Western-based 'intelligence', 'surveillance' and military industrial complex which [are unaudited](#); out of control; and justifying their burgeoning power through seeking out and dealing with presumptuously pronounced threats to 'freedom' and 'democracy' around the world.
- ★ Some 1,271 government organizations and 1,931 private companies working on programs related to counterterrorism, homeland security and intelligence exist in about 10,000 locations across the United States.
- ★ We live in an Orwellian 'Newspeak' world. US (and other Western) main stream media (MSM) continue to play their part in promoting and then air-brushing Western military activity, ambitions and consequences.

Introduction: US Discretionary Spending Foci 🇺🇸

 (18/02/18) (22/02/18) (10/03/18) (03/12/18) (15/12/18) (05/01/19) (03/12/19) (14/12/19) (16/02/20) (24/02/20) (13/05/20) (15/05/20) (04/06/20) (11/06/21) (13/03/22) (17/03/22) (15/08/22) (04/09/22) (02/12/22) (04/12/22) (14/12/22) (25/02/23) (26/02/23) (15/05/23) (17/02/24)

In this 21st Century, the [United States of America is a militarist state](#). Not a 'democracy'; not even, however much it might insist that it is, a 'capitalist' state. And, as one might expect of a militarist state, it's budgetary foci demonstrate this undeniable reality. Michael Beckley described the 2021 reality clearly ⁸⁰⁷:

The United States has spent \$19 trillion on its military since the end of the Cold War [1991]. That is \$16 trillion more than China spent and nearly as much as the rest of the world combined spent during the same period.

And, of course, the bulk of the military expenditures in the rest of the world have been directed to [weapons purchases from US](#) and other Western Arms manufacturers and suppliers⁸⁰⁸

[William Astore summed it up:](#)

In the decades since the draft ended in 1973, a strange new military has emerged in the United States. Think of it, if you will, as a post-democratic force that prides itself on its warrior ethos rather than the old-fashioned citizen-soldier ideal.

As such, it's a military increasingly divorced from the people, with a way of life ever more foreign to most Americans (adulatory as they may feel toward its troops).

Abroad, it's now regularly put to purposes foreign to any traditional idea of national defense.

In Washington, it has become a force unto itself, following its own priorities, pursuing its own agendas, increasingly unaccountable to either the president or Congress.

The [budgetary focus of a democratic capitalist nation](#) reveals the true priorities and intentions of that nation. In the third decade of the 21st century, what are the budgetary priorities of Western capitalist nations?

The budgetary foci of the United States of America should concern all people who value [government of the people, by the people, for the people](#). Its discretionary spending priorities, in dollar values, overwhelmingly focus on its military and 'defense' capabilities and activities. In the crony capitalist world of the 21st century, [with 'defense' contractors hiring large numbers of](#) former senior government officials, military officers, Members of Congress, and senior legislative staff as lobbyists, board members, or senior executives, it is inevitable that funding will follow.

It appears that, for those presenting justificatory military budgetary information to the US public, wisps of conscience (or perhaps embarrassment) remain. Andrew Cockburn explains:

We all know that the U.S. spends obscene sums of money on defense. But the actual amount tends to be a moving target, one that is described by official Washington and its enablers in the media in the smallest terms possible.

Thus in unveiling the Pentagon's 2024 budget request on March 6, DoD Comptroller Mike McCord demurely highlighted \$842 billion as the "top line" a figure dutifully cited in relevant news reports. In his remarks, McCord took pains to remind us that, actually, we're spending much less than we used to: "When I was born [1959] we, the United States, were at nine percent of GDP on defense. Ronald Reagan was considered high at six percent. We're now at three. So it's a big number, but in other contexts, you know, you could look at it another way."

So what do we actually spend on the defense of the United States? Unearthing the true figure demands tireless application combined with a sure grasp of the subterranean pathways along which our dollars travel to fuel the national security machine. ⁸⁰⁹

Not only does the US spend more than 50 percent of its discretionary budget on its military, it has, additionally, committed itself to an upgrading

and refocusing of its nuclear capabilities at a cost of more than \$40 billion a year for the next three decades.

President Trump, in a memorable year (2017) in US presidential politics, was [handed a 'blank check'](#) to wage war against a growing list of US 'enemies'. That blank check remains available to future presidents!

In 2024, after three full years of his presidency, US President Biden presides over a nation still mired in 'forever war'. But that is not what he promised to the United States electorate in the presidential campaign of 2020. He was going to:

...inject strategic focus into U.S. foreign policy, ...to end the United States' forever wars and make the country's international engagements serve the needs of a disaffected public....

Things would be 'different' over the next four years. What [Bernie Sanders was promising](#), Joe Biden would deliver!

Things would be different in 2021!

Just how different they became has been well described by Stephen Wertheim:

The Biden administration took office intending to inject strategic focus into U.S. foreign policy. The president and his team promised to end the United States' forever wars and make the country's international engagements serve the needs of a disaffected public. In its first year, the administration terminated the two-decade-old war in Afghanistan, pledged to "right-size" the U.S. military presence in the Middle East, and even pursued a "stable and predictable" relationship with Russia. By placing less emphasis on certain regions, the logic went, Washington could concentrate on what most affects U.S. interests: managing competition with China and tackling transnational threats such as climate change and pandemics.

Today that vision lies in tatters. The United States is now immersed in multiple wars in Europe and the Middle East, precisely where the administration sought to keep things quiet. Meanwhile, relations with China and Russia have deteriorated so strikingly as to raise the realistic prospect of the first major-power conflict since 1945....⁸¹⁰

[Yasmin Tadjdeh](#), writing in *National Defense*: the business and technology magazine of the National Defense Industrial Association (NDIA) explained why expanding US defense budgets were inescapable:

A renewed sense of urgency [spurred by rivals Russia and China](#) has pushed the U.S. military to speed up the development of hypersonic technology.

The new 21st century military growth industry is [Hypersonic Technology](#)! In a hypersonic-weapons-based war, no country, no region, no city is secure. The 'theater of war' is the world!

Key Companies in the Global Hypersonic Technology Industry

The key market players in the global hypersonic technology market include

1. Aerojet Rocketdyne Holdings Inc. [US],
2. The Boeing Company [US],
3. Brahmos Aerospace Pvt. Ltd. [India],

- 4.Lockheed Martin Corporation [US],
- 5.Thales Group [US],
- 6.General Dynamics Corporation [US],
- 7.Northrop Grumman Corporation [US],
- 8.Raytheon Company [US],
- 9.Saab AB [Sweden],
- 10.Dynetics Inc. [US],
- 11.SpaceX [US], and
- 12.L3 Harris Technologies Inc [US].

(^œ [Hypersonic Technology Market - A Global and Country Analysis: Focus on Type, End User, Launch Mode, and Country - Analysis and Forecast, 2021-2031](#), *BIS Research*, April 15, 2021)

With the US Congress determined to ensure United States military superiority in the third decade of the new century, US military budget increases, justified [using the tried and true formulas](#) of the past eighty years, continue to grow.

Andrew Eversden described the interim 2022 appropriations (no doubt, with the 'Russian invasion of Ukraine' to justify it all, appropriations through the rest of the year will continue to expand):

A bipartisan agreement among Congressional appropriators has the US finally on the verge of a fiscal 2022 budget, one featuring \$782 billion for national defense and an additional \$13.6 billion in aid for Ukraine.

"I'm proud of this package we approved and responded to Putin's unprovoked war in Ukraine," Sen. Jon Tester, D-Mont., said at the McAleese Conference today.

Included in that national defense total is \$728.5 billion for the Defense Department, \$13.5 billion more than the department asked for when its budget request rolled out in late May 2021. The appropriator's agreement comes nearly six months after the fiscal year began, meaning current programs are operating under last year's funding and new programs have been unable to begin.

The new legislation largely increases the Pentagon's procurement and research and development accounts, allocating \$119 billion in research, development, test and evaluation funding, up \$7 billion from the department's request and \$12 billion above the FY21 enacted.

It also allocates about \$145 billion for procurement, \$12.4 billion above the budget request and \$8.4 billion above the last year's appropriation. (Andrew Eversden, ^œ[Congress settles on \\$782.5B national defense budget, adds \\$13.6B in Ukraine aid: Congressional appropriators finally reached a deal after almost six months of continuing resolutions](#), *Breaking Defence*, March 09, 2022)

Leo Shane III and Joe Gould described the Congressional vote:

The package passed both the House and Senate this week with significant bipartisan backing.

Senate Armed Services Committee ranking member Jim Inhofe, R-Okla., said the military funding level - well above what the White House requested in its budget - will help maintain military investments and "keep us from falling even further behind China" and other adversaries.

(Leo Shane III and Joe Gould, ^œ[Congress passes budget with defense boost, \\$13.6 billion in Ukraine aid](#), *Army Times*, March 12, 2022)

The Washington contrived 'War in Ukraine', is aimed at miring Russia in an unending quagmire to sap its military resources and destroy ^œ[civilian support of Russian leadership](#). This is the first proxy conflict of a new 'Cold War' between 'The West' and [newly emerging challengers](#) to Western hegemony.

Given the apparent duplicity of Western European negotiators of the ^œ[Minsk Agreements of 2014 and 2015](#), Russian negotiators will assume that no future 'good faith' assurances can be relied upon. That leaves little room for negotiated settlement of the Ukraine conflict. Russia will have to find a means of ending the conflict without becoming mired in 'endless war'.⁸¹¹

The first direct conflict between 'The West' (comprising those nations and their offspring which have over the past five centuries been involved in colonizing the rest of the world) and newly emerging 'peer' powers with the economic and military strength to directly challenge Western hegemony has set the stage for an [attempt by 'The Rest' to establish a new multipolar world](#).

In 2022, inevitably, given the stakes, [propaganda swamped reality](#) so that it is difficult to determine what was actually occurring in this first proxy war between The West and its first peer challenger.

A credible attempt to cut through the fog of misinformation to explain what happened in Ukraine over the first seven months of 2022 was provided by a blogger pseudonymed 'Big Serge':

My overall prognosis is very simple: I believe that Russia has degraded Ukraine's military capabilities beyond repair, and is now doing the methodical work of grinding away the rest, while forcing the west to bear the unexpected burden of propping up the Ukrainian state and army.

The actual intricacies of Russia's operational plan of course remain a secret, but I believe there is a good chance that most of Ukraine east of the Dnieper will be annexed, as well as the entire Black Sea littoral. (Big Serge, ^œ[The Russo-Ukrainian War: A Six Month Retrospective](#), *Big Serge Thoughts*, September 01, 2022)

M. K. Bhadrakumar summed up the situation in February 2023:

The Russian strategy all through has been to "grind" the Ukrainian military and force Kiev to negotiate but the US is only now realising that this was in reality a war of attrition.....

To quote Jens Stoltenberg, NATO secretary-general, what is unfolding is "a war of attrition... a battle of logistics; as in how do you get enough stuff - materiel, spare parts, ammunition, fuel - to the front lines." But it can also mutate since the Western bloc is unable to define its end goal in Ukraine.

Putin warned that western weapon supplies to Kiev will trigger consequences. "The longer the range of the Western systems being brought to Ukraine, the farther away from our borders we will be forced to push the threat," he said. Plainly put, Russian forces may create a buffer zone in the region west of Dnieper River. Putin called out the Western elite to realise that "it is impossible to defeat Russia on the battlefield."

This is the nearest he came to speaking about the future trajectory of the special operations. To be sure, Russia is closely watching that the support for the war in the US is steadily on the wane and this can impact Biden's political calculus as a divisive election campaign takes over. Of course, the Biden Administration has secured substantial authorised appropriation enabling it to continue the high levels of support to Ukraine through the remaining 8 months of the financial year ending in October, and there is no question that the Western allies will also supplement.

(M. K. Bhadrakumar, [œRussia's Ukraine offensive in suspended animation](#), February 24, 2023)

Beyond doubt, for 'The West' war is good business and, in 2022, beating the drums of war was a highly profitable (if dangerous to the 'survival of organized human society') way of ensuring the 'viability' of US Military Contractors: [œShort term pecuniary profit](#) trumped intelligent foresight!

Noam Chomsky put it well:

There have been many monsters in the past ... but it would be hard to find one who was dedicated to undermining the prospects for survival of organized human society, not in the distant future - in order to put a few more dollars in overstuffed pockets.

In 2022 the United States of America, as hegemon of the 'Western World', with little forethought and hubristic self-belief, brought the world to the brink of another 'cold war'. In doing so, it might well have fast-forwarded the eclipse of 500 years of Western aggressive domination of non-Western territories and communities. The [sun might well be setting on Western Hegemonic control of 'The World'](#).

Robert Kaplan explained:

...[M]isbegotten wars, when serving as culmination points of more general national decline, can be fatal. This is particularly true for empires. The Habsburg empire, which ruled over central Europe for hundreds of years, might have lingered despite decades of decay were it not for its defeat in World War I. The same is true of the Ottoman Empire, which since the mid-nineteenth century was referred to as "the sick man of Europe." As it happened, the Ottoman Empire, like the Habsburg one, might have struggled on for decades, and even re-formed, were it not for also being on the losing side in World War I.

But the aftershocks of such imperial comeuppance should never be underestimated or celebrated. Empires form out of chaos, and imperial collapse often leaves chaos in its wake...

(Robert D. Kaplan, [œThe Downside of Imperial Collapse: When Empires or Great Powers Fall, Chaos and War Rise](#), *Foreign Affairs*, October 4, 2022)

A new Evil Empire for the 21st Century 🇺🇸

 Update dates for this section

In the third decade of the 21st Century The United States of America has lost control of its own foreign policy agendas. They are now being [controlled by unelected 'power brokers'](#).

And, with the Israeli government determined to eliminate all Palestinians from the territories they deludedly claim as 'Jewish', their US lobbyists have

seized control of the US foreign policy agenda. As Alastair Crooke has suggested 'œAmerica is trapped. The power-brokers are unhappy, but impotent' (*Strategic Culture*, August 19, 2024).

A July 2024 address to the United States Congress by the Israeli Prime Minister, Benjamin Netanyahu, vividly demonstrated the power of the 'Israel Lobby' within the nation and within the United States Congress. During Netanyahu's address to the Congress, members gave more than fifty standing ovations, behaving, as one commentator put it, "Like Trained Seals", often chanting 'USA! USA!' as they did so.

And on the 4th of February, 2025, President Trump of the United States met with Prime Minister Netanyahu of Israel in the 'Oval Office'.

Puppet and Puppet Master: Trump's presidential campaign was bought and paid for by The Israel Lobby and Israeli oligarchs⁸¹². Among them, Miriam Adelson gave \$100 million and President Trump is dutifully delivering on his obligations.

At the conclusion of their meeting, in a formal, prepared statement, President Trump described its outcome: a win-win-win solution: Palestinians 'relocated'; Israel secure; and Donald Trump in charge of œbuilding a 'Riviera on the Mediterranean'!

Apparently for Trump, as for Netanyahu, 'relocating' Palestinians 'to other countries' is not the same as 'ethnic cleansing' and 'the only reason the Palestinians want to go back to Gaza is they have no alternative' .⁸¹³

Six days later, Trump expanded on his determination to ethnic cleanse Palestinians from the Gaza Strip.

Brett Samuels reported:

President Trump said Monday he would consider withholding aid to Jordan and Egypt if they do not agree to take in Palestinians as part of a plan for the U.S. to take over and develop the Gaza Strip.

"Would you withhold aid to these countries if they don't agree to take in the Palestinians?" Trump was asked during a gaggle with reporters in the Oval Office.

"Yeah, maybe. Sure, why not?" Trump responded. "If they don't agree, I would conceivably withhold aid. Yeah."

Jordan and Egypt are among the top recipients of U.S. military assistance.

The U.S. and Jordan signed a memorandum in 2022 in which the U.S. committed to providing more than \$1 billion annually in foreign assistance. The U.S. provided roughly \$1.5 billion in foreign assistance to Egypt in fiscal 2023.

(Brett Samuels, œTrump says he may withhold aid to Jordan, Egypt if they don't take in Palestinians, *The Hill*, February 10, 2025)

Trump prides himself on being a 'master of deals'. Nothing is 'off the table' when negotiations start, and one's opponent must be convinced that nothing will be withheld in the drive to a successful conclusion to negotiations. This is the playbook of bullies and Trump is nothing if not a bully!

Doyle McManus, in an article for the *Los Angeles Times* entitled 'œColumn: Trump isn't an isolationist. He's a bully - and that's hurting U.S. influence in

the world', explained:

He has no compunction about violating treaty commitments or ripping up trade agreements, even deals he negotiated himself. He says being unpredictable is an asset. It's also a good way to convince other countries that he's an unreliable friend.

The danger, U.S. and foreign diplomats say, is that some of those countries may decide to look for other allies to help protect their interests....

He might somehow succeed in acquiring Greenland or building beach hotels in Gaza. But it will almost surely be a bad deal in the long run - because it will leave the United States with fewer friends and allies just when we might need them.

President Trump is fast convincing the rest of the world that they need to insulate themselves from the corrosive consequences of relying in any way on the United States of America.

This is the way that empires end: seldom with a bang but often with a whimper!

Pernicious financial, intelligence, surveillance, military and industrial leaches are feeding on the lifeblood of the United States of America. The consequences of their self-interested manipulation of governments and populations are the subject of both this and other chapters. As we explore the consequences, we need constantly to ask ourselves:

In this 21st Century, what would the United States be like if the energy, ingenuity and resources siphoned into both financial 'bailouts' and foreign adventures and wars had been, instead, used to build and maintain the nation's social support systems and internal infrastructures?

Surely, then, it really would have been 'a shining city upon a hill, a model of freedom to the rest of the world'!

But, the reality, in this 21st Century, is that the fiscal and financial health and wellbeing of the United States is reliant on military Keynesianism ⁸¹⁴. As the *United States Department of Defense* explains of its 'Intergovernmental Affairs Program':

National security requires a 'Whole of Government' approach. DoD's Federal agency partners, states, localities, non-profit groups, and the private sector play a critical role in mission readiness and economic security. Supporting and protecting our nation's defense activities and men and women in uniform goes far beyond the military fence line.

To effectively and efficiently address the pressing and complex security challenges this nation faces, DoD must enlist the support of stakeholders at all levels of government and industry.

Financial, intelligence, surveillance, military and industrial organizations know that the successful neoliberal drive to deregulation since the 1960s has rendered Western nations impotent to regulate or censor their activities. Indeed, they have co-opted the neutered governments and political parties of those nations to their agendas:

Washington has felt the need... to build new alliances in the Indian Ocean and Pacific in order to retain relevance, if no longer outright

preeminence, in this region, without committing itself alone to a ruinous new arms race.

Against a backdrop of deep public unawareness, the thinking of U.S. security planners in both political parties along these lines has converged and gathered momentum since then-President Barack Obama's notional pivot....

As Elbridge A. Colby, a deputy assistant secretary of defense in the Trump administration, writes in a chilling new book, "The Strategy of Denial: American Defense in an Age of Great Power Conflict," that reflects this new consensus and foreshadowed the AUKUS deal,

The scale of China's power and the gravity of the stakes mean that the United States must be sure that it can allocate enough of its power and its willingness to bear risk and cost to denying China hegemony in Asia. All alliances and other defense commitments should be made, retained, deferred, or exited in light of this priority.
(Howard French)

With [privatization and corporatization of public infrastructures, resources and institutions](#) around the world, they have gained unprecedented control over governments and people. In a demonstration of this power, over a six week period between February 24, 2022 and April 7, 2022, a new reality came into being in the Western World. The existing media and entertainment channels of the West were refocused to ^œ[present a 'new reality'](#):

"It doesn't have to be solid intelligence," one U.S. official said. "It's more important to get out ahead of them [the Russians], Putin specifically, before they do something."

All of the lies, half-truths and raw propaganda coming from 'Washington' justified as 'necessary deception' of US and other populations because:

We are at war with the Monsters of Eurasia!

The bottom line: 'Don't believe anything we tell you - we're lying to fool the enemy'. From this time on, the world should assume that anything coming from US 'intelligence' sources is designed to deceive, not inform (an admission of something which has long been recognized by critics of US 'intelligence' information)!

[Henry Giroux explained](#) why this is so:

The United States is now addicted to violence because the "war on terror" relies on an extreme fear and hatred of those considered enemies....

The discourse of war, violence and fear now largely mold our conception of ourselves, our relations to others and the larger world. The defining vocabularies of American life undercut the possibility of challenging the assumption that violence is the most important tool for addressing social [or political] problems.

The United States of America, since the 2nd World War, has increasingly believed itself to be under imminent threat from malign external forces. But for constant vigilance and preparedness, the US would be attacked and invaded. ⁸¹⁵

In succeeding years, the ^œ[near-panic of the early 1950s](#) matured into an almost pathological hatred of those external powers which US citizens and politicians believed to be 'threatening' the peace and security of the United

States. This has 'justified' preemptive action against those believed to be plotting against them.

As we have seen, unscrupulous US 'leaders' have, over the past seventy and more years, not hesitated to fan the flames of incipient paranoia in order to ensure support for their 'foreign policy' adventures. And, now, in 2022, the manipulation has gone even further.

All non-compliant media and entertainment channels and sites, not only in the United States but around the Western World, are being subjected to censorship, and all contrary voices silenced.

Had most Western people been told, a month earlier, that this would, or even could, happen they would have considered the teller to be a purveyor of 'conspiracy theories' and so, rightly, dismissed as deluded. But this is, indeed, the new reality.

The oft quoted assertion that 'You are entitled to your own opinion, but you are not entitled to your own facts' no longer holds. In 2022, the 'facts' are what we are told they are! 'Black' is 'white'; or 'grey'; or (whatever we decide is expedient in our determination to deceive/ embarrass/ confuse/ undermine or otherwise unsettle 'the enemy' - which is, of course, anyone these duplicitous 'leaders' decide is a 'threat' to the United States of America!)

The majority of people in Western nations seem to have accepted this reworking of reality as both necessary and legitimate to ensure that foreign powers do not influence the internal affairs of Western nations. As [Goebbels explained](#), 'If you tell a lie big enough and keep repeating it, people will eventually come to believe it'

The nature of United States 'Exceptionalism' which legitimizes the invention of a pseudo-reality to 'justify' expediently contrived control over its population was clearly [explained in 2001](#):

We're an empire now, and when we act, we create our own reality. And while you're studying that reality - judiciously, as you will - we'll act again, creating other new realities, which you can study too, and that's how things will sort out. We're history's actors and you, all of you, will be left to just study what we do.

In the third decade of the century, the United States is doing what aging empires have always done. It is ramping up tensions between itself and those who have long provided justification for its militarization; trying, increasingly desperately, to demonstrate (a fiction which was never real) that it is still in charge, still the hegemonic power-center of the world; still able to dictate terms and enforce compliance; still the world's quick-gun sheriff with a custodial mandate to ensure compliance with an international 'Rule of Law'.

But, in this 21st century, its focus is becoming blurred and its rhetoric decreasingly coherent, convincing or effective. It is hard to maintain focus in a world where too many alternative perceived 'centers of power' require its attention⁸¹⁶. It is difficult to know which of the threats should be dealt with first and how to contain the rest.

With CO₂ levels rising; polar ice melting; nuclear armed nations at loggerheads; US manufactured 'cold war' censorship conditions dividing the world into opposing camps; and sovereign nations funding secret military-

controlled biological weapons laboratories on the borders of opposed nations, we seem hellbent on damning ourselves as a species!!⁸¹⁷

Both Russia (what on earth is the US doing in the Black Sea?⁸¹⁸) and China (what on earth is the [US doing in the South China Sea?](#)) are to be brought to heel. Both are, in the decreasingly coherent estimation of a less than competent US leadership, threatening 'invasions' which must, at all costs, be countered by those whose manifest destiny it is to protect the world from....

It is embarrassing and frustrating for a self-proclaimed 'indispensable nation' and its vassals when those they attempt to 'discipline' refuse to be bullied; when the intended victim demonstrates a maturity sadly lacking in their own behavior.

The *Rand Corporation*, in a 2019 'Research Brief' entitled 'Overextending and Unbalancing Russia: Assessing the Impact of Cost-Imposing Options', outlined US intentions toward Russia ⁸¹⁹:

This brief summarizes a report that comprehensively examines nonviolent, cost-imposing options that the United States and its allies could pursue across economic, political, and military areas to stress - overextend and unbalance - Russia's economy and armed forces and the regime's political standing at home and abroad. Some of the options examined are clearly more promising than others, but any would need to be evaluated in terms of the overall U.S. strategy for dealing with Russia, which neither the report nor this brief has attempted to do.

Today's Russia suffers from many vulnerabilities - oil and gas prices well below peak that have caused a drop in living standards, economic sanctions that have furthered that decline, an aging and soon-to-be-declining population, and increasing authoritarianism under Vladimir Putin's now-continued rule. Such vulnerabilities are coupled with deep-seated (if exaggerated) anxieties about the possibility of Western-inspired regime change, loss of great power status, and even military attack....

(James Dobbins, Raphael S. Cohen *et al*, ⁸²⁰[Overextending and Unbalancing Russia Assessing the Impact of Cost-Imposing Options](#), *Rand Corporation*, April 24, 2019)

Western commentary and media 'reports' in late February, 2022, echoed very similar escalations in Western 'concern' over Iraqi 'development' of 'weapons of mass destruction' in February, 2003.

Jonathan Schwarz explained what happened then in a *Huffpost* blog posting entitled ⁸²¹[Lie After Lie After Lie: What Colin Powell Knew Ten Years Ago Today and What He Said](#) (February 05 2013):

Clearly, Powell's loyalty to George Bush extended to being willing to deceive the world: the United Nations, Americans, and the coalition troops about to be sent to kill and die in Iraq. He's never been held accountable for his actions, and it's extremely unlikely he ever will be.

And, not only US Secretary of State, Colin Powell. From the US President down, Administration officials upheld the lies and distortions fabricated to 'justify' an invasion of another sovereign nation. And an apparently gullible Western commentariat provided the 'serious' 'explanations' and 'backgrounding' for what was being claimed.

The US Administration, under George W. Bush, orchestrated a campaign of disinformation, fed to all-too-cooperative Western media outlets and elaborated in apparently 'serious' Western commentaries. ⁸²⁰

As in 2003, so in 2022: No in depth analysis of underlying causes or of other players in what has unfolded, just

a strategy of containment that increases the cost to Russia and eventually forces internal political change that brings the brutal regime of Vladimir Putin to an end.

If Western populations want to know what is happening and why it is 'necessary', they will find all the confirmation they 'need' in a deluge of mainstream Western popular and 'serious' commentaries.

John Pilger has summed up the Western descent into propaganda: ⁸²¹

It is, at times, difficult to know whether 'Western Experts' are engaging in 'raw propaganda' or genuinely believe the distorted reality they present to their audiences. One is inclined toward the latter! ⁸²²

Russia clearly stated its concerns in 2022, insisting that security is a two sided coin and international policy should address the security concerns of both sides in any reasonable negotiations between Russia and the West. This was a lesson that US President John Kennedy learned the hard way in the Cuban Missile Crisis, October 1962.

Just as the 'Cuban Crisis' was not, in fact, primarily about Cuba in 1962, so, the 'Ukraine Crisis' of 2022 is not primarily about Ukraine.

Khrushchev wanted US missiles removed from Turkey - where they posed a clear and continuing danger to Soviet security - but could not get the United States to listen or respond to his entirely reasonable requests for appropriate security guarantees. Placing missiles in Cuba proved a very effective means of getting the United States to the negotiating table!

It is sad but clear that the United States is even less willing in 2022 to seriously consider and respond to the security concerns of its putative 'enemy'.

Nuclear missiles and other hair-trigger armaments would not, following the resolution of the 1962 crisis, be placed in close proximity to the borders of either nation. And, despite the 'Cold War' atmosphere of the time, both sides entered into long-term security agreements aimed at ensuring that such crises would not recur. ⁸²³

It seems, from Washington's 2022 reaction to Russia's concerns, that The United States is no longer 'agreement capable'! ⁸²⁴ And, sadly, either for 'raw propaganda' purposes or because they really don't understand Russia's security concerns, the United States and its 'expert commentators' are convinced that Russia's 'security concerns' are merely smokescreen for regime change ambitions!

In 2022, without question, if Western 'expert commentators' are to be believed, President Putin of Russia and his advisors are naive!

Not only have they [relied on the dreaded 'novichok'](#) to eliminate their 'opponents', but, in late February 2022, they are going to 'invade Ukraine' in an attempt at 'regime change'.

Russian [explanations of the reasons for the crisis](#) are clear. This is not primarily about Ukraine itself but about the all-too-reasonable security

concerns of Russia in a world where The United States seems to be incapable of entering long-term agreements or understanding the need for the kinds of security guarantees which nuclear powers must, of necessity, provide.

Russia's Foreign Minister Sergey Lavrov, on 30 June 2022, in a joint news conference with the Foreign Minister of Belarus Vladimir Makei, explained Russia's concerns over the belligerent behavior and rhetoric of both the United States and NATO (North Atlantic Treaty Organization). This has been blatantly on display in their open attempts at escalating the conflict in Ukraine - reinforcing Russia's claims of a seriously provocative military buildup in Ukraine over the years both leading up to and following the 2014 coup:

We are seriously concerned about NATO's activities in close vicinity to our borders, primarily in the Baltic states and Poland. We share the opinion that these activities are openly confrontational and tend to lead to more tensions, as well as the division of the European security and cooperation space, that is, they are producing the results which the establishment of the OSCE [Organization for Security and Co-operation in Europe] was supposed to help prevent. Now they are dismantling all this with their own hands, waiving, among other things, the principle of indivisible security, which was publicly declared at the highest level in the OSCE in the late 1990s and in 2010, when it was said that no country should enhance its security at the expense of others. The West's actions have buried this principle.

In the light of the manifestly unfriendly steps taken by the United States and its satellites towards our countries, we reaffirmed that we are firmly determined to further preclude any attempts by the West to interfere in our domestic affairs. We agreed to continue to join efforts to oppose illegitimate unilateral actions by Washington, Brussels and their allies in the international arena.⁸²⁵

Alina Polyakova and Daniel Fried, without doubt 'Western Experts', told us that Putin, who had apparently been slow to learn how the experts do it, was going to do the 'regime change' thing that the US is so practiced at! Instead of employing sanctions to make the economies of regime change victims 'scream' he was going to invade Ukraine and commit Russia to a long and costly war, with 'The West' doing in Ukraine what it [did in Afghanistan in the 1980s](#) ⁸²⁶

Both Western 'raw propaganda' and 'expert commentary' simply elided the central issue driving Russian action in 2022, suggesting either a serious lack of empathic understanding or deliberate intent.

If, the first, then Russian negotiators (and the rest of us!) are in serious trouble. How does one awaken empathy in those with whom one must negotiate the future of humanity?

If, the second, then The West is deliberately misconstruing Russian intent in order to avoid serious negotiation to address issues of central importance to the future of civilization and, instead, incompetently placing short-term political advantage before long-term international peace and security.

In either case, we are in serious trouble!

Whatever form of Government ensures Vassal State control... 

(15/01/23) (26/01/23) (27/01/23) (28/01/23) (05/02/23)

It is the nature of hegemonic centers of political and military power that they subordinate and tie other states to themselves. The means of such manufactured dependence vary in accordance with [the understandings of 'reality'](#) which drive those dominant states.

In Western nations, this subordination is, inevitably, economic and/or military in nature. In this 21st Century, the United States is doing what it has long done: it is tying vassal states to itself through fostering economic/military dependence in those nations.⁸²⁷

On April 28, 2022, the United States Congress 'passed a bill allowing the Biden administration to lend or lease weapons to Ukraine and other eastern European countries'. When dealing with the preeminent world weapons manufacturing and supply nation, nothing comes 'free' and nothing comes cheap! As [Trump explained of another such deal](#): "That was a tremendous day, Tremendous investments in the United States."⁸²⁸

From this time on, it's all about 'good business'⁸²⁹. Expect an escalating supply of weaponry not only to Ukraine but to all those European countries which the US and NATO have urged to support Ukraine in its 'just struggle against Russian tyranny'.⁸³⁰

The US is doing what it did [throughout WW2 and the first Cold War](#): it is 'supporting' Ukraine and surrounding eastern European countries through lend-lease programs of 'military aid'. As Kathryn Watson and Rebecca Kaplan explain to their audience 'The cost of this fight is not cheap'. What they are not explaining is that, win or lose, Ukraine and its eastern European neighbors will find themselves saddled with its cost. As *CBS News* reported⁸³¹:

"The cost of this fight is not cheap, but caving to aggression is going to be more costly if we allow it to happen," the president said in remarks from the White House Thursday morning. "We either back the Ukrainian people as they defend their country, or we stand by as the Russians continue their atrocities and aggression in Ukraine."

(Kathryn Watson and Rebecca Kaplan, ["Congress passes bill letting U.S. lend weapons systems to Ukraine"](#), *CBS News*, April 29, 2022)

Vassal states should beware! Like Ukraine⁸³², they will find themselves expendable pawns in a planetary game of 'chicken' (with massive accumulated 'debts' incurred to the US in the course of fighting its wars of choice), with the United States prepared to gamble the future of those states in a macho supremacy contest with those it has defined as its enemies.

In August 2022, the United States broadened its arrogant belligerence. As though [attempting to embroil Russia in a 'forever war'](#) was not more than enough, it bumbled its way into a South China Sea confrontation⁸³³.

Once again, we are witness to a 'super-power' [reinterpreting past security agreements](#). Apparently past US recognition of the indivisible integration of Taiwan into China (strongly asserted by *both* the Taiwan and the Mainland Governments) was merely 'expedient', not a binding commitment based on good faith negotiations.

On August 2, 2022 the Democrat speaker of the United States House of Representatives, with implicit connivance of the US President, decided to abrogate those good faith agreements and ["deal with Taiwan as a US vassal state"](#), ignoring the protestations of the Government of China.

If ever there was a policy aimed at sabotaging the long-term peaceful integration of Taiwan into the rest of China, this unprovoked assault on Chinese sovereignty is surely that. Given such provocation, the likelihood of China speeding up its process of integrating Taiwan into the rest of China is real.

This ham-fisted display of arrogance once again demonstrated US willingness to callously jeopardize the safety and security of a vassal state.⁸³⁴

Like it or not, The United States has, since 1949, never had any intention of 'allowing' China to 'annex' Taiwan.

From the outset, Taiwan was to be the US' 'frontline' in its determination to eradicate communism and remake China in its own image. If that proved impossible, then, to contain 'The China Threat', it always intended to make a militarized Taiwan the first line of 'defense' against 'communist expansion'.

In the 21st century, the 'œdomino effect' is as real as it ever was. Communism is a 'political virus' which continues to threaten the 'civilized', 'free' governments of 'The West' ⁸³⁵

'The West' has long believed that 'Communism' intends to conquer the world and the United States, as the 'leader' of the 'Free World' has a God-given responsibility to resolutely oppose it wherever, and in whatever form, it infects the 'body politic'.

(Russia might appear to be a 'capitalist' nation but it is, in reality, a nation infected by the political disease of its progenitor.)

That disease can only be eliminated through a complete displacement of all forms of 'communist', 'socialist' and 'authoritarian' government. Communist and socialist governments are always 'autocratic' and 'authoritarian' and the 'democracies' of the world will only be safe when all traces of such government are eradicated.

To paraphrase [Henry Hyde's explanation](#) of the 'threat of terrorism':

Let us begin by accepting there is no single enemy to be defeated, no one network to be eliminated. China and Russia are but our most prominent opponents, but their outlook is shared by many others who are equally committed to our destruction... we know now that we have permanent, mortal enemies who will seize upon our vulnerabilities to bloody us, to murder our citizens, to commit horror for the purpose of forcing horror upon us...

Michael Brown described the US' responsibility for Taiwan:

Any effective deterrence strategy against China must begin with Taiwan's own defenses. The United States needs to signal to Beijing that Taiwan will resist an invasion just as fiercely and creatively as Ukraine has. To be credible, Taiwan should double the proportion of its budget reserved for defense and double its current troop strength of 169,000. At present, Taipei spends about \$19 billion on defense, a figure that pales in comparison with China's \$293 billion. And although Taiwan will not be able to close the gap with China's People's Liberation Army (PLA), it can greatly increase deterrence with a stronger and more prepared military. The goal must be to deny easy access to the island and cause significant damage to attacking Chinese forces, buying time for the United States and allies to assist.

But U.S. and Taiwanese officials must also recognize the lopsided threat Taiwan faces. Historically, Taiwan has spent its defense budget on equipping its military for a head-on conflict with China, including through the extensive purchase of U.S. tanks and fighter jets. But given the overwhelming numbers of tanks, ships, and airplanes that China can now field, this is not an effective use of procurement funds. For example, although Taiwan now has 400 fighter jets and 800 tanks, its forces are dwarfed by China's 1,600 fighters and 6,300 tanks. China also has 450 bombers, nine nuclear submarines, two aircraft carriers, and other equipment that Taiwan does not possess. And in terms of manpower, China has a standing army of more than two million soldiers - nearly 12 times as many as Taiwan.

Faced with this dramatic force disparity, Taiwan would be better off developing asymmetric capabilities that can thwart superior firepower....

(Michael Brown, [Taiwan's Urgent Task: A Radical New Strategy to Keep China Away](#), *Foreign Affairs*, January 25, 2023)

Not before time, Thomas Christensen *et al* in October 2022 injected a little much needed sanity into the US side of the confrontation:

Avoiding war in the Taiwan Strait requires all sides to be deterred. At a minimum, Taiwan must be deterred from declaring formal independence, Washington must be deterred from recognizing Taiwan as an independent state or restoring a formal alliance with the island, and Beijing must be deterred from using military force against Taiwan to compel unification. All sides must not only be threatened with harm for crossing these redlines but also be assured that they will not suffer catastrophic losses to their interests if they refrain from these actions.⁸³⁶

Vassal states should take note!

World-wide death and destruction: The Legacy of Western Exceptionalism 🌍

 (17/05/23)

In a confused and threatened empire vassal states will be called on to deal with ill-defined foes for decreasingly coherent reasons! They will find themselves on the frontline, quixotically opposing imaginary threats: four-armed giants waving their arms in defiance of those inspired by impossible dreams!

But, of course, there will be real world consequences! Charging at windmills can be disastrous!

Vassal states are being prepared, committed to accepting and paying for 'necessary' armaments and 'systems' and drawn into the web of 'willing partners' in another year of 'regime change' adventures! ⁸³⁷

Despite a common US commentariat view of the 2017-2021 Trump presidency as being 'nationalist', and, therefore, 'isolationist' in its promotion of 'America First', this is more illusion than reality. Trump was not intent on isolating the US (though many of his foreign policy actions (let's not call them 'policies') achieved this) but driven by that belief in US exceptionalism which has dominated US foreign policy for many decades.

Biden's history is premised on a similar understanding of US exceptionalism.

Stephen Wertheim explained it well:

Four years ago, as Joe Biden prepared to leave the vice-presidency, he told the World Economic Forum that the United States would continue to lead the 'liberal international order' and 'fulfill our historic responsibility as the indispensable nation.'⁸³⁸

The 'liberal international order' which Biden evoked is rapidly losing its appeal in a world which has, for far too long, been subjected to the presumptuous whims of its 'leaders'. Richard Haass and Charles Kupchan have cogently argued that:

The international system is at a historical inflection point. As Asia continues its economic ascent, two centuries of Western domination of the world, first under Pax Britannica and then under Pax Americana, are coming to an end. The West is losing not only its material dominance but also its ideological sway.

(Richard N. Haass and Charles A. Kupchan, [“The New Concert of Powers: How to Prevent Catastrophe and Promote Stability in a Multipolar World,”](#) *Foreign Affairs*, March 23, 2021)

They have provided a description of their version of a 'best vehicle for promoting stability in the twenty-first century' - 'a global concert of major powers' which involves evoking 19th century style 'major nations' cooperation and consultation.

But, as Stewart Patrick has argued, 'the world faces an array of daunting challenges, from climate change to nuclear proliferation to cybersecurity, that demand great-power cooperation regardless of regime type' and 'Over the past two centuries, the international system has grown to include 193 independent sovereign nations and developed a dense array of multilateral organizations and treaties that regulate everything from the use of force to the allocation of orbital slots in outer space.'⁸³⁹

If the United States is to participate in increasingly urgently required international cooperative policy and regulatory negotiations and not merely act as a wrecking-ball of such initiatives by others, then it will have to display a radically different approach to foreign relations and foreign policy to that which emerged in 2021!

On March 16th, 2021, the Office of the Director of National Intelligence 'released the declassified [“Intelligence Community assessment of foreign threats to the 2020 U.S. federal elections.”](#) Within a day, the US president invoked its [“information”](#) to justify refocusing from internal problems to external 'threats'.⁸⁴⁰

It did not take long for US President Biden to play the 'external threat' card - a tactic US presidents have long used to justify a refocusing from internal to external problems. In language reminiscent of the darkest days of the Cold-War, Biden explained to his voting base that Russia was being controlled by a 'Killer' who was going to be made to pay the 'price' of his crimes!

US President Joe Biden said he believes Russian President Vladimir Putin is a "killer" when asked by ABC News host George Stephanopoulos.

His question follows a federal investigation into Russian-linked cyber attacks and an intelligence report linking the Kremlin to election-related online interference that promoted Donald Trump and right-wing conspiracy theories in an attempt to discredit Mr Biden.

Asked whether he believes Mr Putin is a "killer" in a pre-taped interview that aired on Wednesday, the president responded: "I do."

"The price he's going to pay, you'll see shortly," he said.

(Alex Woodward, ["Biden believes Putin is a 'killer': 'The price he's going to pay, you'll see shortly'", *The Independent*, March 18, 2021](#))

Russian President Putin's measured response to the interview suggests a maturity hard to find amongst Biden's 'team of immaculate professionals'. Evgeny Mikhaylov described the response:

Vladimir Putin has addressed Joe Biden's controversial statement about alleged Russian meddling in the 2020 presidential elections, which took a personal turn against him.

"As for the statement by my American counterpart, we really are, as he said, personally acquainted. What would I answer him? I would tell him: stay healthy! I wish him good health", the Russian president said, stressing he is not joking or being ironic.

He also noted that people always project onto others what they think about themselves.

"There have been many difficult, dramatic, and bloody events in the history of each nation. But when we assess other people, when we assess other states, other peoples, we are always looking in the mirror. We always see ourselves there", Putin said.

(Evgeny Mikhaylov, ["I Wish Him Well": Putin Responds to Biden's Comments About Him, *Sputnik International*, March 18, 2021](#))

It has taken a long time for the leaders of most Western capitalist nations to begin to realize that the US, as 'leader' of the 'Free World'⁸⁴¹, has been pursuing 'feckless and self-serving' policies.

In a post-Trump reality, increasing numbers of people in Western nations are beginning to see through the propagandizing rhetoric of the past seventy years. And, slowly but surely, their leaders are beginning to realize that subserviently following Washington's lead is unlikely to be in the long-term interest of either themselves or their nations.

Jonathan Kirshner summed up the post-Trump foreign policy future for the United States of America (most of Biden's 2021 'team of immaculate professionals' were, of course, in the pre-Trump US, complicit in forging the current foreign policy reality):

the world cannot unsee the Trump presidency. (Nor, for that matter, can it unsee the way members of the U.S. Congress behaved in the final weeks of the Trump administration, voting opportunistically to overturn an election and helping incite violence at the Capitol.) From this point forward, countries around the globe will have to calculate their interests and expectations with the understanding that the Trump administration is the sort of thing that the U.S. political system can plausibly produce.

Such reassessments will not be to the United States' advantage. For 75 years, the general presumption that the United States was committed to the relationships and institutions it forged and the norms it articulated shaped the world in ways that privileged U.S. interests. If it is increasingly perceived to be feckless and self-serving, the United States will find the world a more hazardous and less welcoming place....

For U.S. partners in Asia, Europe, and the Middle East, however, Washington's priorities on the world stage must now be interrogated, and any conclusions reached must be held with qualifications rather than confidence. And there is nothing that President Joe Biden and his team of immaculate professionals can do to stop that. From now on, all countries, everywhere, must hedge their bets about the United States - something that will unnerve allies more than adversaries.
(Jonathan Kirshner, [Gone But Not Forgotten: Trump's Long Shadow and the End of American Credibility](#), *Foreign Affairs*, March/April 2021)

[Follow The Money: US Military Expenditures Swamp All Others](#) 🇺🇸

 (14/07/23)

To understand the true foci and determinations of a sovereign capitalist nation such as the United States of America, one needs to '[follow the money](#)'.

[US military expenditures swamp all others](#). The US is, first and foremost, a militarist state with, as Wertheim put it, '[Delusions of Dominance](#)'.

Not only is it a state which, increasingly, uses either explicit or implicit threat of military intervention as a major element of international diplomacy, it has also, through the past fifty years 'offshored' its non-military industrial base (primarily to China, but also to other south- and east-Asian nations), [refocusing its industrial base to military purposes](#).

Through the past half century, the United States has become the world's preeminent weapons manufacturing base and its politicians and diplomats have become its premier armaments sales force, aggressively promoting 'Made in the United States' military hardware and services to the rest of the world.

The [proxy war in Ukraine](#), since 2014, provides an excellent case study of United States' military/ industrial tactics in ensuring its preeminence and its profits. The procedures followed are not subtle: they are based on a pragmatic need to ensure an ongoing, long-term demand for new military equipment from United States suppliers.

The numerous '[regime change](#)' adventures in which the United States has engaged have all included the promotion of 'made in the United States' military equipment and services.⁸⁴²

When it comes to business, self-interest overrides all other considerations. It [will brook no competitors](#) and, as it demonstrated in the [Saudi-Arabia - Yemen conflict](#), the armaments business is not about support of its allies or 'morality', it is about market-share and profits! In 2021 France became another US ally to be taught this lesson! Howard French explained⁸⁴³:

In the space of a single news cycle last week, the substance behind the news that the United States and Britain had joined forces to sell nuclear submarine technology to Australia came to be overshadowed by the emotions aroused by this development - namely, France's theatrically indignant response to having its preexisting deal to sell submarines to Canberra canceled without notice.

Paris has invoked "treason" and spoken of being stabbed in the back, comparing U.S. President Joe Biden unfavorably to his predecessor, Donald Trump, all while taking the extraordinary step of recalling its ambassadors from the United States and Australia, something seldom

done even with hostile powers. Remarkably, not even Beijing, the putative target of this new security partnership, has been remotely as vocal.

An *RT* assessment of the AUKUS deal gives a much needed explanation of possible consequences:

A new geopolitical deal that will see the US and UK team up with Australia to station nuclear submarines deep down in the Pacific Ocean is a hostile step aimed not only at Beijing, but at Moscow too, a top Russian official claims. Nikolay Patrushev, the secretary of Russia's Security Council, told the *Argumenty i Fakty* newspaper on Tuesday that the pact between the three nations, known as AUKUS, will inevitably be yet another military bloc aimed at containing and confronting the two strongest non-Western powers.

According to the interview, Patrushev compared the pact to QUAD, a strategic dialogue format between the US, India, Japan, and Australia, designed to strengthen Washington's position across Asia. According to him, the group is *"a military-political bloc with a pronounced pro-American character."*

"Just the other day, another military bloc was formed in the region - the American-British-Australian AUKUS, which pursues the same goals," the top official went on. According to him, the new deal, which will see London and Washington hand over the technical know-how for Canberra to develop and deploy nuclear-powered submarines, is a threat to *"the entire security architecture in Asia."*

([New AUKUS nuclear bloc won't just battle China, it will take West into confrontation with Russia too, Moscow's security chief says, RT](#), September 21, 2021)

Even a [pseudo-democratic](#) militarist state needs to justify its continuing militarization to its population and the US, in both justifying its militarization and in legitimizing its military expansionism, has employed the rhetoric of 'great-power competition'.

John Mearsheimer (2019), a visiting US political analyst, (in a light-hearted debate) put US attitudes toward its 'friends and allies' into perspective for Australians:

...If you go with China you want to understand you are our enemy. You are then deciding to become an enemy of the United States... You are either with us or against us... If you're trading extensively with China and you're friendly with China you're undermining the United States... You're feeding the beast from our perspective and that is not going to make us happy and when we are not happy you do not want to underestimate how nasty we can be!
(<https://youtu.be/IER2SGbjCW0>)

As Shakespeare put an old and well-worn aphorism: 'Many a true word hath been spoken in jest.'

Daniel Nexon has described the ways in which both the Trump and, in 2021, the Biden administrations have engaged in 'great-power competition', 'wasting limited resources on illusory threats'⁸⁴⁴: As he cogently explains, in the post-Trump world, 'in the long run, a fixation on great-power competition is likely to undermine, rather than enhance, U.S. power and influence' ⁸⁴⁵

To justify its overwhelming military funding, the US has always needed a credible 'external threat' which requires it. For forty years, the Soviet Union provided that justification, but, since 1991, it has had to cast around for other 'justifications'.

For three decades, it contrived to convince itself, the US population and the rest of the 'Free World' that [an amorphous international threat of 'terrorism'](#) required constantly [expanding military budgets and concomitant 'wars'](#). Stephanie Savell, in 2019, summarized the consequences:

Less than a month after the September 11 [2001] terrorist attacks on the United States, U.S. troops - with support from British, Canadian, French, German and Australian forces - invaded Afghanistan to fight Al Qaeda and the Taliban. More than 17 years later, the Global War on Terrorism initiated by President George W. Bush is truly global, with Americans actively engaged in countering terrorism in 80 nations on six continents.

Stephanie Savell (2021) has provided an updated description of [US 'counterterrorism' activities](#) (if one included the activities of all those members of the 'coalition of the willing' the number of countries and communities affected would be even greater):⁸⁴⁶

Savell, in a 2023 study, describes the cost, in human lives, of 'the most violent conflicts in which the U.S. government has been engaged in the name of counterterrorism since September 11, 2001'. Yet, we need to remember that, depressing as this report is, it tells but a small part of the devastating story of warmongering and sanctioning around the world in which the United States and its 'coalitions of the willing' have engaged over the past thirty years:

The total death toll in the post-9/11 war zones of Afghanistan, Pakistan, Iraq, Syria, and Yemen could be at least 4.5-4.6 million and counting, though the precise mortality figure remains unknown. Some of these people were killed in the fighting, but far more, especially children, have been killed by the reverberating effects of war, such as the spread of disease. These latter indirect deaths - estimated at 3.6-3.7 million - and related health problems have resulted from the post-9/11 wars' destruction of economies, public services, and the environment. Indirect deaths grow in scale over time.

Though in 2021 the United States withdrew military forces from Afghanistan, officially ending a war that began with its invasion 20 years prior, today Afghans are suffering and dying from war-related causes at higher rates than ever...

Rather than teasing apart who, what, or when is to blame, this report will show that the post-9/11 wars are implicated in many kinds of deaths. In a place like Afghanistan, the pressing question is whether any death can today be considered unrelated to war. Ultimately, the impacts of the ongoing violence are so vast and complex that they are unquantifiable.

(Stephanie Savell *et al*, ⁸⁴⁶[How Death Outlives War: The Reverberating Impact of the Post-9/11 Wars on Human Health](#)', *Watson Institute, Brown University*, 2023)

It has been a commonplace experience of over-extended empires throughout history that, as they become mired in prolonged military campaigns and unending insurgencies, they increasingly [replace their](#)

'regular' armed forces with mercenaries. And, in the 21st century, the US is also engaging in this long-established practice.

Casting around for justifications for expanding military budgets

As its military adventures drag on with no apparent end in sight, one way of lessening civilian concern on the 'home-front' is to replace its regular forces with, to use that delightfully Western capitalist euphemism, 'contractors'. Lawrence described the 2021 process in Afghanistan:⁸⁴⁷

But that cannot be indefinitely sustained. So, it has cast around for other convincing justifications for its constantly expanding military budget:

In a surreal address to the Munich Security Conference (Feb. 15, 2020) US Secretary of Defense Mark Esper spelt out the Trump era vision of a 21st century future provided in its ^œ[National Defense Strategy](#) (NDS):

As a prelude to that strategy: China has, for more than 20 years, found itself increasingly hemmed in by US air bases and military ports. John Reed (2013), for *Foreign Policy* explained:

The Pentagon's big, new strategy for the 21st century is something called Air-Sea Battle, a concept that's nominally about combining air and naval forces to punch through the increasingly-formidable defenses of nations like China or Iran. It may sound like an amorphous strategy - and truth be told, a lot of Air-Sea Battle is still in the conceptual phase. But a very concrete part of this concept is being put into place in the Pacific. An important but oft-overlooked part of Air-Sea Battle calls for the military to operate from small, bare bones bases in the Pacific that its forces can disperse to in case their main bases are targeted by Chinese ballistic missiles.

(John Reed, ^œ[Surrounded: How the U.S. Is Encircling China with Military Bases](#), *Foreign Policy*, August 20, 2013)

In 2022, Michael Klare summed it all up: 'None Dare Call It "Encirclement": Washington Tightens the Noose around China'⁸⁴⁸

As the 2020 US Secretary of Defense spelt out, over the past two decades that strategy has 'matured' into a new, [potentially devastating threat](#) to international peace and security⁸⁴⁹

The United States is [inventing a new super-villain](#); a new [Evil Empire](#) for the 21st century.

Fareed Zakaria has described how it is happening:

In February 1947, U.S. President Harry Truman huddled with his most senior foreign policy advisers, George Marshall and Dean Acheson, and a handful of congressional leaders. The topic was the administration's plan to aid the Greek government in its fight against a communist insurgency. Marshall and Acheson presented their case for the plan. Arthur Vandenberg, chair of the Senate Committee on Foreign Relations, listened closely and then offered his support with a caveat. "The only way you are going to get what you want," he reportedly told the president, "is to make a speech and scare the hell out of the country."

Over the next few months, Truman did just that. He turned the civil war in Greece into a test of the United States' ability to confront

international communism. Reflecting on Truman's expansive rhetoric about aiding democracies anywhere, anytime, Acheson confessed in his memoirs that the administration had made an argument "clearer than truth."

Something similar is happening today in the American debate about China. A new consensus, encompassing both parties, the military establishment, and key elements of the media, holds that China is now a vital threat to the United States both economically and strategically, that U.S. policy toward China has failed, and that Washington needs a new, much tougher strategy to contain it. This consensus has shifted the public's stance toward an almost instinctive hostility...

(Fareed Zakaria, ^œ[The New China Scare: Why America Shouldn't Panic About Its Latest Challenger](#), *Foreign Affairs*, January/February 2020)

US political and foreign policy toward China, which, as Christopher Hill argues (below), 'ascribes malicious motives to a country that is more likely trying to protect what it has', demonstrates a growing US political and administrative apprehension. There is an uneasy and growing feeling that they are losing control of a world they have long-believed was theirs to oversee⁸⁵⁰. A world in which they, in the words of the US Secretary of Defense in 2020,

keep the peace, promote prosperity, ensure security, and protect the sovereignty of all freedom-loving countries.

Branko Milanovic has explained the mismatch which has become increasingly apparent in the 2020 responses of the two nations to the Covid-19 crisis (again, one needs to be aware of the commonplace Western-centric nature of such explanations): ⁸⁵¹

Keith Johnson and Robbie Gramer, in a *Foreign Policy* feature article entitled

The Great Decoupling: Washington is pressing for a post-pandemic decoupling from China. But the last big economic split brought on two world wars and a depression. What's in store this time?

have drawn parallels between the Trump Administration's 2017 to 2020 dealings with China and the Roosevelt Administration's dealings with Japan during the 1930s ⁸⁵².

The Roosevelt administration's tone-deaf response to Japan's 1930s problems, 'ramping up economic pressure on Japan, culminating in a trade and oil embargo', is more than matched by 21st century US attitudes toward China (echoed in some US acolyte nation attitudes).

Singaporean Prime Minister Lee Hsien Loong, in 2020, explained why forcing Asian countries to take sides in another, Asian centered, Cold War between the US and China might well backfire for the United States:

Asian countries do not want to be forced to choose between the two. And if either attempts to force such a choice - if Washington tries to contain China's rise or Beijing seeks to build an exclusive sphere of influence in Asia - they will begin a course of confrontation that will last decades and put the long-heralded Asian century in jeopardy⁸⁵³.

Western nations would do well to learn from ASEAN attitudes and policies. ⁸⁵⁴

Henry Farrell and Abraham Newman have explained why the folly of decoupling from China isn't just perilous - it's impossible:

...[F]or all the official enthusiasm for decoupling, there is little agreement on what it would actually entail. Does decoupling mean

- [R]educing U.S. economic vulnerabilities?
- Making the United States less dependent on China?
- Exploiting China's dependence on U.S. technology?
- Withdrawing wholesale from the World Trade Organization?

Turning any of these proposals into effective policies would require a level of technical knowledge that neither the U.S. government nor the private sector has right now.

As with so many of the 2020 US Administration's declarations and maneuverings, off-the-cuff rhetoric has displaced clear understanding, analysis and planning. But this is not merely an infection of the Trump Administration, it has resonated within the US Congress. As the authors explain:

On May 14, U.S. President Donald Trump threatened to break the United States' economic relationship with China. "There are many things we could do," he told Fox Business host Maria Bartiromo. "We could cut off the whole relationship. Now if you did, what would happen? You'd save \$500 billion." It was Trump's most extreme anti-China rhetoric to date, but it wasn't out of step with the mood in Washington. Both Republicans and Democrats agree that China has transformed from a competitor into an adversary, and perhaps even an enemy.

(Henry Farrell and Abraham Newman, ["The Folly of Decoupling From China It Isn't Just Perilous - It's Impossible"](#), *Foreign Affairs*, June 3, 2020)

Christopher Hill has commented on the US political maneuvering, spelt out by its Secretary of Defense in 2020, to brand China as Public Enemy No. 1, intent on 'more internal repression, more predatory economic practices, more heavy-handedness, and... a more aggressive military posture'. Which, inevitably, makes 'the Pentagon's top concern: the People's Republic of China'.

...Fear and loathing of China is no substitute for self-confidence and unity of purpose in dealing with it. U.S. foreign policy under Trump and his dyspeptic secretary of state, Mike Pompeo, aims less to broaden coalitions and forge effective policy than simply to marshal fear by ascribing malicious motives to a country that is more likely trying to protect what it has. The administration has made little effort to chart a way forward with a China that will neither disappear nor give in to diktats from the United States....

...Does the United States really seek lasting enmity with China? Is that in the American interest? Anyone who has visited the Great Wall might ask, do we really want to get into a fight with a people who built a thing like that?...

(Christopher R. Hill, ["What Does Washington Want From China?: Pique Is Not a Policy"](#), *Foreign Affairs*, May 11, 2020)

Ken Moak, in an article entitled

The futility of being 'tough' on China: Not only can China push back against its foes militarily and economically, its leaders see no reason to

mess with success

has explained why US attempts at 'disciplining' China for what it has defined as its 'malicious motives' over the past several decades are based on deep misunderstanding of what China is all about⁸⁵⁵:

...[T]here is a limit to what the US can do to stop China's rise, particularly when the reasons for stifling the country's progress are based on subjective and questionable information. While accusing China of spying, the US could not or would not provide credible evidence. On China engaging in currency manipulation, even the United States' own Treasury Department disagreed.

Indeed, the only "sin" China has committed is that its development model is too successful, elevating the economy to No 2 in nominal GDP terms and the biggest in purchasing power parity terms within a generation.

(Ken Moak, ^œ[The futility of being 'tough' on China](#), *Asia Times*, October 27, 2020)⁸⁵⁶

Entirely predictably, the major 'news' channels of the United States have [swung into action in support of the official refocusing](#) of US foreign policy and rhetoric.

Damien Cave, Motoko Rich and Jack Ewing show how it is done in a *New York Times* (June 15, 2020) essay entitled '^œ[Break the China Habit? Lobsters, Lights and Toilets Show How Hard It Is](#)' and sub-titled:

The risks of relying economically on the Asian superpower have never seemed clearer. But as the world tries to get moving again, it needs China more than ever,

There is little need for coherence or presentation of information when the aim is propaganda. So, they have linked China's early alleged mishandling of the coronavirus and consequent disruption of the country's ability to make and buy the world's products with, of course, 'the faults of its authoritarian system' which led it 'to ratchet up its propaganda war'.⁸⁵⁷

As the propaganda offensive against China grows, so does US paranoia. A nation which, by 2010, had developed a 'Homeland Security' industry which, to [paraphrase Priest and Arkin](#),

...included some 1,271 government organizations and 1,931 private companies working on programs related to counterterrorism, homeland security and intelligence in about 10,000 locations across the United States with an estimated 854,000 people... holding top-secret security clearances in Washington and the surrounding area and had 33 building complexes for top-secret intelligence work which were either under construction or had been built since September 2001 and which occupied the equivalent of almost three Pentagons or 22 U.S. Capitol buildings - about 17 million square feet of space.

has decided that the real threat to the security and wellbeing of US citizens comes, not from [its own poorly regulated and monitored](#) intelligence and surveillance industries, but from Chinese firms like *TikTok* ⁸⁵⁸

And, in the twilight of 2023, the now 'tried and true' United States' resort to hunting down 'terrorists' has pivoted to 'Asia'.

The United States has hosted the first meeting of the new working group on terrorism in the Quad format in Honolulu, Hawaii, on December 19-21. The QUAD working group on terrorism was

constituted in March at the foreign minister level meeting in New Delhi hosted by External Affairs Minister S. Jaishankar.

The joint statement issued after the March meeting had noted "with deep concern that terrorism has become increasingly diffuse, aided by terrorists' adaptation to, and the use of emerging and evolving technologies such as unmanned aerial systems and the internet, including social media platforms for recruitment and incitement to commit terrorist acts, as well as for the financing, planning, and preparation of terrorist activities."

(M. K. Bhadrakumar, ["US' war on terror against Houthis is smoke and mirrors"](#), *Indian Punchline*, December 24, 2023)

The experiences of the 20th Century, as George Orwell alerted us, should make us acutely aware that the most serious threats to 'freedom and democracy' come, not from external sources, but from the intelligence and surveillance organizations designed to gather information on citizens - powerful but secretive and barely under the control of their own governments. Priest and Arkin [described such developments](#) within the United States of America:

Underscoring the seriousness of these issues are the conclusions of retired Army Lt. Gen. John R. Vines, who was asked last year to review the method for tracking the Defense Department's most sensitive programs. Vines, who once commanded 145,000 troops in Iraq and is familiar with complex problems, was stunned by what he discovered.

"I'm not aware of any agency with the authority, responsibility or a process in place to coordinate all these interagency and commercial activities," he said in an interview. "The complexity of this system defies description."

President Donald Trump, in his 2020 ["resort to 'federal officers' to control US citizens"](#) in Portland, demonstrated the very real power held by both the US Administration and Congress to mobilize federal 'law enforcement agencies' against their own civilian populations. And, in doing so, he, in a truly Orwellian manner, 'justified' his behavior by accusing 'foreign powers' of being behind civil unrest. ⁸⁵⁹

Not only was there very little effective congressional protest against such behavior, President Trump managed to garner support for his condemnation of 'Chinese interference' in the US from loyal international 'allies' and supporters.

Once again, it's down the rabbit-hole with the USA.

To paraphrase Lewis Carroll (1872):

O frabjous day! Callooh! Callay!

- A new Coalition of the Willing;
- New Space Surveillance and policing powers⁸⁶⁰;
- Investing in cutting-edge technologies and accelerating the modernization of our force;
- Divesting from legacy systems and re-investing those savings into hypersonic missiles, artificial intelligence, autonomous systems, and other game-changing technologies⁸⁶¹;
- Using these advanced capabilities to help keep the peace, promote prosperity, ensure security, and [protect the sovereignty of all](#)

freedom-loving countries;

- Establishing well-regarded principles for the lawful and ethical use of AI;
- Protecting these high-tech breakthroughs from theft and exploitation by strengthening our foreign investment laws, supply chains, export controls, university-based research, and cyber defenses;
- Encouraging our allies and partners to begin to take similar actions, as they thoroughly assess the long-term threats and challenges posed by China;
- Making the hard economic and commercial choices needed to prioritize our shared security; and by working together to maintain a ready and capable alliance network.

"The contrast between China's malevolent actions and United States' leadership couldn't be more obvious".

The US and 'its allies' can and will ensure the peace and security of the world even if it has to destroy it in the process

And Congress has supplied all the funding and powers we need to do so Trump chortled in his joy.

The US is heading into a 21st century Cold War (taking Australia with it!) 🇺🇸

 (29/07/16) (06/08/16) (28/03/16) (26/07/16) (10/09/16) (03/11/17) (20/06/20) (02/07/20)
(01/12/20) (18/06/21) (24/06/21) (26/06/21) (30/06/21) (31/08/21) (30/09/21) (07/05/22) (08/05/22)
(05/06/22) (06/06/22) (26/06/22) (01/07/24)

In this 21st Century the United States has replaced the often evoked but largely mythical 'International Rule of Law' with an increasingly irrational expediency 'justified' by a 'rules based order' in which the 'rules' of yesterday morph into those required to support the concerns of today.

In the process the true nature of the US driven 'rule of law' is exposed: a chameleon-like entity changing as required to 'justify' a kaleidoscopic 'reality' driven by US expediency.

Whatever the US decides to do will always be found to be 'justified' by appeal to that 'rules based order'. Both domestic and foreign policy morph in sympathy with that shifting 'reality' and the rest of the world is left to deal with an unpredictable 'world power' which insists on its 'indispensability'.

Russian Foreign Minister Sergey Lavrov, commenting on ongoing negotiations between Russia and Iran, succinctly summed up the problem with the United States version of a 'rules based order':

We discussed international issues in depth. We stand together in rejecting the concept of the rules-based order that is pushed forward by the United States and its satellites. This concept is designed for use as a substitute for international law and the UN Charter's basic principles, primarily the principle of sovereign equality of states. Everything that the United States and its allies are doing in the international arena flat-out undermines this fundamental UN principle. Iran and Russia condemn the untenable practice of unilateral illegal sanctions that are imposed contrary to the UN Charter and need to be opposed by all independent members of the international community.

To this end, the Group of Friends in Defence of the Charter of the United Nations was established which, among others, includes Iran and Russia and has more than 20 members. I'm sure the group will expand.⁸⁶²

In the third decade of the 21st century we are, indeed, living in a rapidly changing reality. With the world descending into climate crises and with neoliberalism weakening polities, syphoning wealth to the few, degrading infrastructures and disenfranchising most of humanity, what will this world be like ten years from now?

The unprecedented global challenges that the United States faces today - climate change, pandemics, nuclear proliferation, massive economic inequality, terrorism, corruption, authoritarianism - are shared global challenges. They cannot be solved by any one country acting alone. They require increased international cooperation - including with China, the most populous country on earth.

It is distressing and dangerous, therefore, that a fast-growing consensus is emerging in Washington that views the U.S.-Chinese relationship as a zero-sum economic and military struggle. The prevalence of this view will create a political environment in which the cooperation that the world desperately needs will be increasingly difficult to achieve...

Developing a mutually beneficial relationship with China will not be easy. But we can do better than a new Cold War. (Bernie Sanders)⁸⁶³

How refreshing it is, in this third decade of the 21st century, to hear a sane assessment of the world scene coming out of Washington! How much both the United States and the rest of the world has lost⁸⁶⁴ in the [US election of their current president](#).

While the political [situation in 2020 made it difficult](#) to promote radical 'New Deal' policies, one should ask, as so many in the United States and around the world have asked,

If not in 2020, then when will it ever be propitious to vigorously oppose Democrat selection of a corporatist presidential candidate?

There has, in the post-Cold War (Mark I) United States of America, been an important change in political focus and foreign policy approach to the rest of the world. Richard Haass explained:

The old foreign policy paradigm grew out of World War II and the Cold War, founded on the recognition that U.S. national security depended on more than just looking out for the country's own narrowly defined concerns. Protecting and advancing U.S. interests, both domestic and international, required helping shepherd into existence and then sustaining an international system that, however imperfect, would buttress U.S. security and prosperity over the long term.

Despite missteps (above all, the misguided attempt to reunify the Korean Peninsula by force and the war in Vietnam), the results largely validated these assumptions. The United States avoided a great-power war with the Soviet Union but still ended the Cold War on immensely favorable terms; U.S. GDP has increased eightfold in real terms and more than 90-fold in nominal terms since the end of World War II.

The new paradigm dismisses the core tenet of that approach: that the United States has a vital stake in a broader global system, one that at

times demands undertaking difficult military interventions or putting aside immediate national preferences in favor of principles and arrangements that bring long-term benefits.

The new consensus reflects not an across-the-board isolationism - after all, a hawkish approach to China is hardly isolationist - but rather the rejection of that internationalism. Today, notwithstanding Biden's pledge "to help lead the world toward a more peaceful, prosperous future for all people," the reality is that Americans want the benefits of international order without doing the hard work of building and maintaining it.

(Richard Haass, ^œ[The Age of America First: Washington's Flawed New Foreign Policy Consensus](#), *Foreign Affairs*, November/December 2021)

Through the first four decades of the post-Cold War world, the US has pursued its interests with an essentially irrationalist expediency. It is, as the [neo-conservative drivers of its Middle East adventures claimed](#), creating its own reality - a reality which it is increasingly determined to impose on the rest of the world. A Bush White House aide put it in a nutshell:

We're an empire now, and when we act, we create our own reality. And while you're studying that reality - judiciously, as you will - we'll act again, creating other new realities, which you can study too, and that's how things will sort out. We're history's actors and you, all of you, will be left to just study what we do.

Paul Roberts explained:

The neocons used September 11, 2001, as a "new Pearl Harbor" to give power precedence over law domestically and internationally. The executive branch no longer had to obey federal statutes, such as the Foreign Intelligence Surveillance Act or honor international treaties, such as the Geneva Conventions. An asserted "terrorist threat" to national security became the cloak which hid US imperial interests as the Bush Regime set about dismantling US civil liberties and the existing order of international law constructed by previous governments during the post-war era.

(Paul Craig Roberts, ^œ[The New Neo-Con Reality](#), *CounterPunch* October 28, 2008)

The true importance of the incumbent of 'The White House' to running the United States' Administration has been well illustrated in 2024.

The two most likely candidates to be fielded by the *Democrats* and the *Republicans* in November's presidential election, Donald Trump and Joe Biden, fronted the cameras in a stage-managed 'presidential debate'.

Jonathan Cooper, with later editing by Colleen Long and Curtis Yee, in an ^œ[Associated Press report](#) (June 28, 2024), summed it all up:

The first general election debate of the 2024 season was defined by personal attacks after U.S. President Joe Biden delivered rambling answers and his Republican rival, Donald Trump countered with falsehood...

The 'most powerful nation in the world' was, once again, presented with two blatantly incompetent candidates between which they would have to decide in the upcoming election. And, despite growing protests at being asked to vote for either a Republican candidate who seemed unable to tell between fact and fiction in his responses to questions and a Democratic candidate clearly exhibiting signs of advancing dementia, neither party seemed

prepared to revisit the adequacy of their most probable future chosen candidates. It was, apparently, unnecessary to do so!

Michael Hudson summarized it all very well:

I think most commentators are missing the point. Biden is the IDEAL president BECAUSE he has dementia. The ideal is for the CIA, NSC and other key agencies also to be headed with Alzheimers individuals.

That means that they can't testify to what happens because they honestly can't remember. More important, it means that control is in the hands of their operators, via Blinken and Sullivan. That bypasses the election neatly, putting control in the hands of the Dark State and the donor class.

(Michael Hudson, ⁸⁶[comment on a Naked Capitalism blog posting](#), June 30, 2024)

The 'democratic' processes of the United States have been captured by 'big-money'. 'Democratically elected' politicians who [rely on plutocratic support](#) for both election and, all-too-often, for 'guidance' in the ongoing political administration of the nation, are indeed the very definition of what Roosevelt, in the 1930s, claimed were fascist politicians.

[As he argued](#) "Fascism - ownership of Government by an individual, by a group, or by any other controlling private power" is the deepest and most insidious threat to the democratic organization and functioning of a Western Democracy.

With politicians and key administrators beholden to their plutocratic backers, decision-making in the United States of America has been fractured into a multitude of poorly connected focuses driven by short-term self-interest.

Any attempt at 'understanding' the increasingly chimeric politics of the nation and its regions is constantly thwarted by this ongoing process of satisfying the demands of disparate power-holders whose self-focused drive to power is not conducive to cooperative planning at any level of government ⁸⁶⁵.

The plutocratic hollowing out of Western democracies is indeed a threat to the wellbeing and rights of populations in such nations. However, the larger, and more serious threat to the rest of the world has lain, and still lies, in an even more fundamental weakness implied in the [definition of 'independent individualism' at the root of 'Western democracy and Civilization'](#).

Overt insistence on the preeminent right to 'individual independence' and freedom to behave as self-interested individuals [at the expense of all forms of social cohesion and consequent social and political organization](#) has led to the absurd insistence that all who live in 'non-democratic' societies are living in 'autocratic' and 'authoritarian' societies.

The claim by the United States, as the hegemonic center of Western Capitalism, that all those living in non-democratic societies and polities need to be 'freed' becomes a declaration of 'war' against all nations and [communities which place the wellbeing of the community before the self-interest of individuals](#).

They must be 'liberated' so that, having cast off the [chains of 'society'](#), their populations can freely develop their own unique individualities in a new 'democratic' reality consisting of independent individuals living in a 'globalized free world'.

For the independent individual, self-interest trumps any and all forms of 'social' responsibility. State, community, family, friendship, all forms of social, economic and political grouping and all forms of responsibility legitimized and required through involvement in them are subordinate to self-interest. As Thatcher insisted 'There is no such thing as society'!

Hal Brands has described Biden's version of all this:

THE BIDEN DOCTRINE

This three-fold challenge suggests a three-fold response - elements of which can be seen in the Biden administration's early moves.

First, the United States must strengthen the cohesion and resilience of the democratic community against its autocratic rivals and make such democratic solidarity truly global, since so many aspects of the threat require a global response.

Second, it must lead the world's democracies in addressing transnational problems that no nation can solve on its own.

And it must build a "position of strength" for global rivalry by reinvesting in its own competitiveness and demonstrating that democracies can still deliver for their citizens.

The Biden foreign policy has been centered on putting this sweeping concept of American strategy - rooted in the inescapable fact that the supremacy of democracy is more imperiled than at any time in generations - into operation.

(Hal Brands, ⁸⁶[The Emerging Biden Doctrine: Democracy, Autocracy, and the Defining Clash of Our Time](#), *Foreign Affairs*, June 29, 2021)

There is a deep need in this century to understand that variations in governing systems around the world [stem from the primary ideological differences](#) which shape their understanding of reality and their consequent societal organization.

We cannot afford that simplistic understanding which leads to designation of all [systems different to those of the West](#) as 'autocratic or 'authoritarian' or 'totalitarian' and so to binary division of the world between 'The West' and 'The Rest'⁸⁶⁶. A *World Politics Review* email entitled 'Insight' (25 June, 2021) demonstrated this naive Western 'understanding' of 'reality':

Popular protests are on the rise, and they are increasingly going global.

Over the past two years, popular movements demonstrating against fiscal austerity and corruption have **brought down governments-in democracies and authoritarian regimes alike**-from Europe and Latin America to Africa and Asia. (my emphasis).

When all forms of government other than those from 'The West' are perceived as 'authoritarian', and [one's predisposition is to 'free' the oppressed of the world](#), then any form of government not identified as a 'Western Democracy' becomes a legitimate target of hostility. And so...

The US is heading into a 21st century Cold War⁸⁶⁷, quite consciously and deliberately focused on creating conditions which will enable the United States of America to hold the rest of the world to ransom through threat of unstoppable hypersonic nuclear missile attack backed by overwhelming military superiority. Such weaponry is, by its nature, extremely hazardous. [Noam Chomsky has explained:](#)

[These] extremely hazardous weapons, ...have only a few minutes flight-time to Moscow, posing a decapitation threat, a sudden attack that would destroy any possibility of response. That, of course, sharply increases the danger of a nuclear response to warnings given by automated systems that have often failed in the past, thus ending all of us...

Anyone familiar with the record knows that it's a virtual miracle that we have so far avoided terminal nuclear war. The threat, which was already grave, was heightened by the Trump nuclear posture review that authorized new destabilizing weapons and lowered the threshold for nuclear attack.

Jade Gailberger has described [Australia's willing commitment to cooperating with the United states](#) in developing and testing hypersonic weaponry:

Hypersonic missiles that can travel at five times the speed of sound - or between Sydney and Melbourne in just seven minutes - will be built by Australia and the United States under a milestone agreement.

It will be Australia's entry to the global arms race to develop the technology for the fastest missiles ever made, although research has been underway for 15 years.

Australia's defence industry, including small and medium businesses, will play a key role in building the weapons.⁸⁶⁸

Nigel Pittaway has explained the nature of the cooperative⁸⁶⁹[SCIFiRE](#) relationship between Australia and the United States of America:

From the U.S. perspective, the effort falls under the Allied Prototyping Initiative, which is managed by the Directorate of Advanced Capabilities within the Office of the Under Secretary of Defense for Research and Engineering.

The program will be executed by the U.S. Air Force under the auspices of the weapons program executive officer, and it will leverage more than 15 years of collaboration on research into scramjets, rocket motors, sensors and advanced manufacturing materials between the two countries.

The agreement follows discussions between former U.S. Defense Secretary Mark Esper and Australian Defence Minister Linda Reynolds during the bilateral Australia-US Ministerial Consultation talks held in Washington in July.

"SCIFiRE is a true testament to the enduring friendship and strong partnership between the United States and Australia," Michael Kratsios, acting undersecretary of defense for research and engineering, said in a statement. "This initiative will be essential to the future of hypersonic research and development, ensuring the US and our allies lead the world in the advancement of this transformational warfighting capability. We thank the Australian Department of Defence for their shared commitment to this game-changing effort."

(Nigel Pittaway, ⁸⁶⁹[Australia, US partner on air-launched hypersonic missile](#), *Defense News*, December 01, 2020)

There is madness in the air!

At the same time as ⁸⁷⁰[Australia defied international pressure to set Greenhouse Gas emissions targets](#), it willingly committed to escalating

nuclear tensions around the world by cooperating in developing devastating first-strike nuclear weaponry.

With hypersonic weaponry at its disposal, that US-led 'first-strike' threat becomes insuperable⁸⁶⁹.

If the 20th century Cold War threatened humanity with nuclear destruction, this kind of escalation all-but-guarantees it!

The US administration's (and, as 2020 drew to a close, Australia's) vision for the 21st century is of a world engulfed in nuclear apocalypse.

As 2019 drew to a close, the inevitable happened: Congress approved a massive increase in US military spending with little or no constriction of the president's war powers⁸⁷⁰.

The House on Wednesday passed a \$738 billion military policy bill that would authorize the creation of the Space Force championed by President Trump as the sixth branch of the military...

The 377-to-48 vote reflected broad bipartisan support for the compromise package, one of the nation's most expensive military policy bills to date. It passed over the opposition of a bloc of progressive Democrats and libertarian-minded Republicans who objected to its steep price tag and its omission of provisions they had proposed to limit the president's power on an array of military matters....

"This is exactly what the American people have been demanding of government, that we can actually move forward on legislating, on governing, to show that we are adults that are able to get things done on issues of national security," said Representative Andy Kim, a freshman Democrat who represents a New Jersey district that voted for Mr. Trump in 2016. "Even in a time of divided government."

The Senate is expected to take up the compromise bill and send it to the president's desk as early as next week.

(Catie Edmondson, ^{ae}[House Passes \\$738 Billion Military Bill With Space Force and Parental Leave](#): A bipartisan group of lawmakers agreed to give troops a pay raise and the president his Space Force, while jettisoning a slew of measures that would have reined in the president's war powers, *New York Times*, December 11, 2019)

William Astore has explained: War is the new normal for the 21st century United States of America:

War, in other words, is [the] new normal, America's default position on global affairs; and peace, some ancient, long-faded dream. And when your default position is war, whether against the Taliban, ISIS, "terror" more generally, or possibly even Iran or Russia or China, is it any surprise that war is what you get?

- When you garrison the world with an unprecedented 800 or so military bases⁸⁷¹,
- When you configure your armed forces for what's called power projection,
- When you divide the globe -- the total planet -- into areas of dominance (with acronyms like CENTCOM, AFRICOM, and SOUTHCOM) commanded by four-star generals and admirals,

- When you spend more on your military than the next seven countries combined,
- When you insist on modernizing a nuclear arsenal (to the tune of perhaps \$1.7 trillion) already quite capable of ending all life on this and several other planets,

What can you expect but a reality of endless war?

Think of this as the new American exceptionalism. In Washington, war is now the predictable (and even desirable) way of life, while peace is the unpredictable (and unwise) path to follow.

In this context, the U.S. must continue to be the most powerful nation in the world by a country mile in all death-dealing realms and its wars must be fought, generation after generation, even when victory is never in sight. And if that isn't an "exceptional" belief system, what is? (William J. Astore, [American Exceptionalism Is Killing the Planet The Many Abuses of Endless War](#), *TomDispatch*, December 1, 2019.)

The US Department of Energy's National Nuclear Security Administration (NNSA) provided a justificatory explanation of its priorities and plans over the next thirty years. In its [Fiscal Year 2018 Stockpile Stewardship and Management Plan](#) (SSMP), it describes its plans to "ensure the safety, security, and effectiveness of the U.S. nuclear stockpile and to maintain the scientific and engineering tools, capabilities, and infrastructure that underpin the nuclear security enterprise". ⁸⁷²

William Broad and David Sangerjan, in a 2016 *New York Times* article, summed up the proposed developments:

...[W]hile the North Koreans have been thinking big - claiming to have built a hydrogen bomb, a boast that experts dismiss as wildly exaggerated - the Energy Department and the Pentagon have been readying a line of weapons that head in the opposite direction.

The build-it-smaller approach has set off a philosophical clash among those in Washington who think about the unthinkable.

...The explosive innards of the revitalized weapons may not be entirely new, they argue, but the smaller yields and better targeting can make the arms more tempting to use - even to use first, rather than in retaliation.

Gen. James E. Cartwright, a retired vice chairman of the Joint Chiefs of Staff who was among Mr. Obama's most influential nuclear strategists, said he backed the upgrades because precise targeting allowed the United States to hold fewer weapons. But "what going smaller does," he acknowledged, "is to make the weapon more thinkable."

...The B61 Model 12, the bomb flight-tested last year in Nevada, is the first of five new warhead types planned as part of an atomic revitalization estimated to cost up to \$1 trillion over three decades. As a family, the weapons and their delivery systems move toward the small, the stealthy and the precise.

(William J. Broad and David E. Sangerjan, [As U.S. Modernizes Nuclear Weapons, 'Smaller' Leaves Some Uneasy](#), *New York Times*, January 11, 2016)

[A strange new military has emerged in the United States](#). Think of it, if you will, as a post-democratic force that prides itself on its warrior ethos rather than the old-fashioned citizen-soldier ideal. As such, it's a military

increasingly divorced from the people, with a way of life ever more foreign to most Americans (adulatory as they may feel toward its troops). Abroad, it's now regularly put to purposes foreign to any traditional idea of national defense' (William Astore, March 22, 2016).

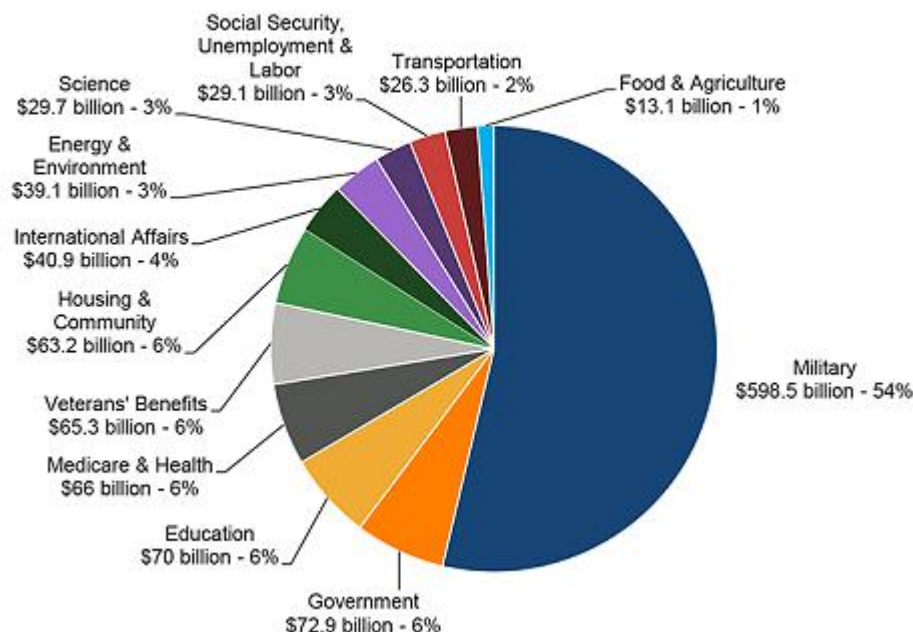

As Eisenhower explained in 1960: "The total influence [of that Military-Industrial Complex] - economic, political, even spiritual - is felt in every city, every State house, every office of the Federal government"⁸⁷³.

 (07/08/16)

The website ⁸⁷⁴[National Priorities Project](#) has illustrated the degree to which, to the present, 'defense' dominates and justifies federal budgetary spending in the United States - which, in its own mind, has, for more than half a century, been 'a nation under foreign threat':

In fiscal year 2015, military spending is projected to account for 54 percent of all federal discretionary spending, a total of \$598.5 billion.

Discretionary Spending 2015: \$1.11 Trillion

 (09/09/16) (16/05/17) (19/05/17)

Now, the US Military-Industrial Complex is being funded as no other military has been funded in Western history (eclipsing the combined funding of the [next nine nations in the world](#))

Neta Crawford has spelt out US 'war on terror' costs over the past 18 years in a report subtitled 'A Summary of the \$5.6 Trillion in Costs for the US Wars in Iraq, Syria, Afghanistan and Pakistan, and Post-9/11 Veterans Care and Homeland Security':

As of late September 2017, the United States wars in Iraq, Afghanistan, Pakistan and Syria and the additional spending on Homeland Security, and the Departments of Defense and Veterans Affairs since the 9/11 attacks totaled more than \$4.3 trillion in current dollars through FY2017. Adding likely costs for FY2018 and estimated future spending on veterans, the costs of war total more than \$5.6 trillion....

(Neta C. Crawford, ⁸⁷⁵[Costs of War](#), Watson Institute, Brown University, November 2017)

Lest it be imagined that the US Military Industrial Complex is a careful steward of such astronomical sums, Idrees Ali and Mike Stone, in a *Reuters* report, put that delusion to rest ⁸⁷⁴:

The Pentagon has failed what is being called its first-ever comprehensive audit, a senior official said on Thursday, finding U.S. Defense Department accounting discrepancies that could take years to resolve.

Results of the inspection - conducted by some 1,200 auditors and examining financial accounting on a wide range of spending including on weapons systems, military personnel and property - were expected to be completed later in the day.

"We failed the audit, but we never expected to pass it," Deputy Secretary of Defense Patrick Shanahan told reporters, adding that the findings showed the need for greater discipline in financial matters within the Pentagon.

(Idrees Ali and Mike Stone, ⁸⁷⁵[Pentagon fails its first-ever audit, official says, Reuters](#), November 16, 2018)

And, in December, 2023, Lindsay Koshgarian again describes the continuing US Pentagon's financial hall of mirrors:

The Pentagon just failed its audit - again. For the sixth time in a row, the agency that accounts for half the money Congress approves each year can't figure out what it did with all that money.

For a brief recap, the Pentagon has never passed an audit. Until 2018, it had never even completed one.

Since then, the Pentagon has done an audit every year and given itself a participation prize each time. Yet despite this year's triumphant press release - titled "DOD Makes Incremental Progress Towards Clean Audit" - it has failed every time.

(Lindsay Koshgarian, ⁸⁷⁶[The Pentagon Fails Its Audit Again - and Again and Again and Again and Again and Again](#): No other federal agency could get away with this. There would be congressional hearings. There would rightly be public outrage, *Common Dreams*, December 01, 2023)

For more on all this see:

Short-circuiting Political Safeguards Against Impulsive War Making Prosecuted by Unaccountable 'War Heroes'

 List of Update Dates:

The history of capitalism is, without doubt, a history of [nations committed to militarism: to invasion, subjugation and rapine](#), justified as a 'civilising mission' by those whose moral superiority has driven them to accept responsibility for 'civilising' and 'developing' the rest of the world. As [Hirst \(1900\) explained](#):

Our colonies... owe their vitality and strength, and most of the finer characteristics which make them almost unique in the history of colonization... to the policy of non-interference, to the studied avoidance of aggression, to toleration and generous amity between conflicting creeds and diverse races, to Liberal principles and Liberal ideas.

And, despite the unravelling of Western European empires in the post-WW2 period, the colonial enterprise, now called '[neo-colonialism](#)', has continued unabated. The future of the world is to be 'capitalist'. As ⁸⁷⁵[Fukuyama argued](#)

...[L]iberal democracy may constitute the 'end point of mankind's ideological evolution' and the 'final form of human government,' and as such constitute[s] the 'end of history.' That is, while earlier forms of government were characterised by grave defects and irrationalities that led to their eventual collapse, liberal democracy was arguably free from such fundamental internal contradictions.⁸⁷⁵

Hammond (1900) explained the mindset of Western 'democratic' capitalists intent on 'civilizing' the world: 'It is the major premiss of the Imperialist argument that British [and, by extension, US] civilization is the best in the world'

In the 21st Century, the United States, the [current center of Western Hegemony](#), remains confident of its superiority and 'right' (indeed, 'duty') to direct the world (because it is, always and inevitably, 'at the center of whatever is good, just, stable, and orderly').

Zachary Karabell explained why United States politicians, of both major varieties, have long-shared 'a worldview that puts the United States at the center of whatever is good, just, stable, and orderly and that any who depart from the wishes of the United States are opposed to whatever is good, just, stable, and orderly':

The U.S. midterm elections demonstrated that domestically, Americans are sharply divided, with the balance of power nationally almost exactly split between Democrats and Republicans and each believing that the other party is too extreme and a threat to democracy. Yet when it comes to foreign policy, Americans and their political parties are much more aligned. In theory, that should be a good thing. In reality, it is not.

That's because alignment is based on a continued fantasy of American preeminence globally that may have been true in the middle of the 20th century but has long since passed its expiration date. This la-la-land syndrome has sharp consequences. In not grasping the changing balance of power globally, U.S. foreign policy undermines what remains of U.S. power, not just internationally but domestically...

(Zachary Karabell , ⁸⁷⁶[Democrats and Republicans Agree That America Is Always Right: Washington can no longer afford its self-defeating "with us or against us" attitude. Foreign Policy](#), November 10, 2022)

This has been the fable upon which [Western Capitalists have all agreed](#). But, as Joe Brunoli has argued, the reality for the center of world capitalism in this 21st century is rather different:⁸⁷⁶

...If we are to be honest, having a government that is run by and for the corporations; a government in which the line between public service and private enterprise is increasingly blurred; a government that represents the perfect 'marriage' between the powers of the State

and those of corporations, means, by historical definition, that we have a 'fascist' system of government....

The collapse of the Soviet Union in the late 20th century was widely trumpeted within the US and among US allies as [a victory of 'democracy' over 'totalitarianism' brought about by an aggressive buildup in military power](#) within the US under President Reagan.

This ostensibly validated the burgeoning growth of US military budgets and justified a growing belief that US authority around the world required an unchallengeable military.

The US was becoming a militant nation whose 'economy' underpinned and relied upon its military power. US Capitalism was fast morphing into US Militarism. Future US 'diplomacy' would increasingly become prelude to invasion rather than being the means for avoiding conflict.⁸⁷⁷

The late 20th century [profit-motivated off-shoring of manufacturing facilities](#) by Western corporations presumed a neocolonial relationship between those corporations and the territories to which they moved. Most of the needed infrastructural costs of the transfer were borne by the 'grateful' neocolonial territories which were encouraged to compete with each other to attract what IMF and World Bank officials told them would be highly beneficial 'foreign direct investment'.

The corporations involved did not for a moment believe that any of those territories would have the ability to turn the tables on their 'benefactors'.

The inevitable [cost to those neocolonial administrations of funding the necessary infrastructures](#) required by transnational companies massively increased their foreign debt burdens. So, it seemed, in the neoliberal climate of the times, absurd to believe that they could become independent of Western corporate control, no longer competing for corporate favor but able to develop independently and profit from the relocated facilities and/or technologies.⁸⁷⁸

Those that attempted to do so, soon found themselves being regarded not as cooperative clients of Western powers but as 'competitors' and possible future foes.

Evan Medeiros and Ashley Tellis described the 21st century expression of all this:

Beginning in 2020, U.S. Secretary of State Mike Pompeo and Deputy National Security Adviser Matt Pottinger, among others, started speaking about putting pressure on the Chinese Communist Party in ways that many interpreted as calls for regime change. Pompeo, slamming Beijing's "new tyranny," memorably declared: "If the free world doesn't change, communist China will surely change us." Distinguishing between the Chinese people and their regime, Pottinger urged the former "to achieve citizen-centric government in China" as an antidote to the CCP.

This rhetoric is rooted in a strain of thought that contends that the characteristics of a regime - rather than the country's national interests or its position within the international system - determine state behavior....

(Evan S. Medeiros and Ashley J. Tellis, [Regime Change Is Not an Option in China](#), *Foreign Affairs*, July 8, 2021)

So, what happens when a nation like China, whose strength is firmly founded on [Western corporate transfer of non-military US \(and other Western\) industrial activity](#) to it⁸⁷⁹, becomes a perceived threat to US hegemony?

A *Global Times* editorial described the US move to reduce its reliance on China and realign its supply chains:

As the US and India appear to move toward closer trade ties, it is essential for China to be vigilant as to Washington's plan to accelerate a global realignment of supply chains.

India and the US have established a new working group to build sustainable supply chains and boost bilateral trade, the governments said in a joint statement on Thursday after the conclusion of the 13th India-US Trade Policy Forum in Washington, Reuters reported.

Also, Indian Union Commerce and Industry Minister Piyush Goyal said on Wednesday that US Commerce Secretary Gina Raimondo will visit India in March this year, accompanied by a high-powered delegation of global CEOs of large multinational companies, according to Indian media outlet ANI.

While there is no shortage of topics about trade frictions between India and the US, such as the US removal of India from its generalized system of preferences and India's digital competition law, it has to be admitted that the US-India economic and trade relationship is in a period of rapid development....

(Editorial, ⁸⁸⁰[GT Voice: Rising signs of US supply chain shift require vigilance](#), *Global Times*, January 12, 2023)

The problem for the United States in 'Washington's plan to accelerate a global realignment of supply chains' is that in future years India might well become the next 'China'.⁸⁸⁰

India might be willing to court Western favor to its own advantage but, as the US found in its dealings with China, there is no way of ensuring this into the future.⁸⁸¹

India's Prime Minister Narendra Modi, in early 2023, seemed to be experiencing a Western determination to weaken his position in India. By insisting on India's right to maintain an independent political position in the world (based on its long-term [leadership of the non-aligned movement](#)) Modi was apparently being seen as an 'obstacle' to the realignment of US supply chains from China to India.

Hans India described what seemed to be happening:⁸⁸²

Qian Feng spelled out the dilemma:

...[M]any Indians have increasingly become aware that Washington is, most of the time, the biggest culprit of the chaos and crises all over the world. They have also started to sense Washington's actual intentions behind its wooing of New Delhi: The US is making India serve its strategic interests.

India's mistrust in the US is real. It mainly comes from the fact that what Washington has promised to New Delhi has turned out to be lip service. The US claims that it attaches great importance to India on matters in which India has a tremendous air of expectancy, such as market access issues. Yet, Washington has been reluctant to grant what India hopes for.

Washington will not terminate its efforts to rope in New Delhi in various fields such as strategy, diplomacy, and security. Against the backdrop that the US has already regarded China as its top rival, the US wants to further sow discord between China and India by provoking friction between them. In this way, India can support the US' strategy, playing a more significant role in containing China. That is to say, as long as Washington sees Beijing as its top opponent, it will not stop attempts to woo India.

(Qian Feng, ⁸⁸²[Indians rating US as a 'security risk' indicates India will not be a loyal supporter](#), *Global Times*, January 18, 2023)

A 2022 *Global Times* editorial summed up the consequences for China:⁸⁸³

It appeared, in April 2023, that, if Bhadrakumar is correct, India was willing to pursue diplomatic policies driven by pragmatic, self-interested opportunism (reminiscent of Türkiye's foreign policy orientation) which seemed at odds with its long-declared policy of '[nonalignment](#)'.⁸⁸⁴

In its attempt to 'remain neutral', India, under Modi's leadership, is suffering increasing regional intolerance and violence. Sushant Singh described the scene:

...This August, [Modi] asserted that India's [G-20] presidency would help make the world into "one family" through "historic efforts aimed at inclusive and holistic growth." The government's message was clear: India is becoming a great power under Modi and will usher in an era of global peace and prosperity.

But 1,000 miles away from New Delhi, in the northeastern state of Manipur, India is caught in a conflict that suggests it is in no position to serve as an international leader. Over the last four months, ethnic violence between Manipur's largest community, the Meiteis, and its second-largest minority, the Kukis, has killed hundreds of people and rendered 60,000 people homeless. Mobs have set fire to over 350 churches and vandalized over a dozen temples. They have burned more than 200 villages.

At first glance, it may seem as if the violence in Manipur will not hinder Modi's foreign policy ambitions. After all, the prime minister has traveled the world over the last four months without having to talk about the conflict. It did not come up (at least publicly) in June, when U.S. President Joe Biden rolled out the red carpet for Modi in Washington, D.C. It was not mentioned when Modi landed in Paris three weeks later and met French President Emmanuel Macron. And the issue has not arisen during his visits this year to Australia, Egypt, Greece, Japan, Papua New Guinea, South Africa, and the United Arab Emirates.

(Sushant Singh, ⁸⁸⁵[Why Modi Can't Make India a Great Power: Government-Backed Intolerance Is Tearing the Country Apart](#), *Foreign Affairs*, September 4, 2023)

It is not hard to understand why 'The West' and its entourage have ignored India's ongoing ethnic and religious troubles. After all, such conflict has been 'stock-in-trade' for the US and its Western allies over the past half century and more and, in September 2023, India is being courted by Western powers eager to recruit it as a trojan horse in attempts to derail the embryonic 'New World Order'.

Of course, though 'The Pentagon must be feeling elated', the apparently 'wild swing in Indian policy' is what one might expect of policies driven by

pragmatic, self-interested opportunism. The pendulum might, just as dramatically, swing in another, perhaps unrelated, direction when/if significant advantages are to be gained by such a change.

While, in 2023, ⁸⁸²India clearly wants an improved trading relationship with the world's largest importer of finished manufactures, it has, through the post-WW2 period, shown itself to be disconcertingly independent in its international relations with Western states.

As China's *Global Times* observed following apparently effusive support of each other by US and Indian leaders in a Modi state visit to the US,

This seems perfect, but we all know that many plans concocted in imagination often fall apart in reality, just like the Chinese idiom "discussing warfare on paper." The more strategically independent a country is, such as India, the less likely it is to strictly follow the script written by Washington, especially when Washington demands actions that go against its own national interests. We believe that New Delhi will make calm and sober choices, as history has proven.

(⁸⁸³US will lose its 'huge bets' on China's neighboring region: *Global Times* editorial, *Global Times*, June 24, 2023)

India can but hope that the myopic self-interest which has driven Western corporate 'offshoring' will enable them to reap the benefits without incurring the costs of expediency-driven 'Washington alignment'.

Such weathercock policies will, however, make India a fair weather companion in serious attempts at creating and sustaining a 'new world order'.

Bhadrakumar, in a post (July 6, 2023) focusing on India's performance in hosting a teleconference between Shanghai Cooperation Organization (SCO) leaders, described India's ambivalent approach to the central aims of the organization:⁸⁸⁵

He summed up India's ambivalent attitude to involvement in 'a new world order' in a *Russia Today* contribution:⁸⁸⁶

It seems that Washington considers India (perhaps correctly!) to be its *Trojan Horse*, subverting the ambitions of those organizations. Nations whose foreign policies are focused on pragmatic self-interested opportunism make disconcerting and potentially unpredictable partners in any determination to reform the 'world order'.

The presumption that those corporations and financiers responsible for moving Western industrial facilities and activities 'offshore' will, with the rising 'threat of China', relocate their operations to Western nations is, of course, delusional.

That will only happen when deregulation has stripped Western populations of all of the 'New Deal' protections which made them 'high cost' 'welfare states', intent on ensuring the quality of life of their populations rather than ensuring the profits of the super-rich.

A *Global Times* editorial described the consequences of China's emergence as a threatening competitor to Western hegemony:⁸⁸⁷

In a typically myopic foreign policy initiative, the 2023 United States' Administration decided to attempt to weave India into its solution to the 2023 exclusionary realignment of Middle Eastern nations. This Eurasian initiative had been brought to a head by the Chinese in brokering a

resolution to the long-standing, US fomented, Saudi-Iran antagonisms. As Bhadrakumar explains,

The Biden Administration is in a persuasive mood, won't take no for an answer. National Security Advisor Jake Sullivan disclosed at a think tank conference in Washington on Thursday that he proposed to travel to Saudi Arabia on Saturday for talks with Saudi leaders.

The Saudi establishment daily Asharq al-Awsat, quoting from Bloomberg, reported that Sullivan will be followed by Secretary of State Antony Blinken "in a new sign of the US administration's determination to cement ties with the Kingdom."

Meanwhile, Sullivan revealed that also going to Saudi Arabia will be representatives from India and the United Arab Emirates to discuss "new areas of cooperation between New Delhi and the Gulf as well as the United States and the rest of the region." In essence, he claimed he is spearheading a White House initiative to reset Washington's Gulf strategy.

Sullivan has a way of creating misconceptions, and there are no signs that New Delhi is even aware of this White House initiative to integrate India into the Biden Administration's Gulf strategy.

(M. K. Bhadrakumar, [US needs a junior partner in the Gulf](#), May 06, 2023)

Milan Vaishnav provides a perceptive corrective to the dominant 2023 narrative of an India fast becoming another Western-style 'economic miracle', meekly falling into line behind half-baked US' foreign policy initiatives:

...Western interlocutors are convinced that the combination of Russia's Ukraine quagmire and China's flagrant aggression on the Sino-Indian border makes the time ripe to wean India off its addiction to Russian arms and consolidate its anti-China posture. This year, India will simultaneously hold the presidencies of the G-20 and the Shanghai Cooperation Organization, a Eurasian political and security group historically dominated by China and Russia - a symbolic victory for its efforts to be seen as a leading, rather than a balancing, power on the global stage.

On closer inspection, the narrative hyping India's inexorable rise appears less assured. Reckoning with India's contradictions is an exercise in cognitive dissonance....

India may be touted as the "next big thing," but as with any marketing campaign, one would be well advised to read the fine print.

(Milan Vaishnav, [Is India's Rise Inevitable?: The Roots of New Delhi's Dysfunction](#), *Foreign Affairs*, April 14, 2023)

Shekhar Gupta, in an endorsement of a Western-focused future for India, sub-titled 'Nostalgia for the non-aligned years is back in India, multilateralism is in fashion, and only places where we seek refuge are the organisations China founded or dominates', warns of the dangers of involvement in such a 'multipolar' alternative:⁸⁸⁸

It would seem that Indian 'non-alignment' poses a problem for its whole-hearted alignment with any non-India-based multilateral initiatives. With India a less than reliable corporate 'partner', [hyperglobalization](#) is going to be alive and well in this third decade of the 21st century!

When the threat of US military power no longer deters but strengthens the resolve to resist... 🇺🇸

When the threat of US military power no longer deters but strengthens the resolve and internal political cohesion of a targeted nation then a militarist state which has voluntarily transferred its industrial base 'overseas' is left with only two options: attempt to belatedly rebuild its voluntarily gutted industrial economy; and/ or double-down on military supremacy and use diplomacy as a prelude to conflict.

In this 21st century, nations which will not accept unconditional US hegemonic dominance find themselves being confronted by an industrially weakened but militarily strengthened center of Western Capitalism. They are left with a [choice of one of two roads leading to subjection: defeat or surrender](#).

Those nations which find themselves targets of US belligerence (harnessing both its financial and military advantages in attempting to bring its perceived foes to their knees) must, inevitably, if they are to successfully counter US moves, insulate their economies from US predatory attacks.

China has, over the past several years, been doing just this.

It has a peculiar advantage in its attempts to insulate its internal economy from US aggression.

Its potentially internally self-sufficient economy provides increasingly secure protection from US attacks.

It has, in this 21st century, increasingly insulated itself from dependence on the US dollar and so positioned itself to avoid reliance on 'SWIFT, the financial messaging system, which is under de facto U.S. control and a major source of American geopolitical leverage'. In these efforts it has employed a [fiat credit system](#) to fund its internal credit requirements.

Using such funding, it has planned and executed increasingly sophisticated internal infrastructural and industrial development⁸⁸⁹. And it has, simultaneously, underwritten its internal economy, developing strong internal demand both through the inevitable growth in employment possibilities resulting from its infrastructural programs and through its increasingly sophisticated 'poverty alleviation'⁸⁹⁰ and 'œsocial security' programs.

At the same time, the dependence of the West on global supply chains (deliberately created by short-sighted Western corporate off-shoring) protects China's export-oriented economic activity from Western 'protectionist' policies. When most of a state's remaining industrial capacity and increasingly poorly paid labor force has become dependent on that offshored industrial base, talk of 'protectionism' and tariff imposition is delusional (as US President Trump found in his misbegotten 'trade war' with China).

Chinese description of all this is summed up in [its "dual circulation" strategy](#). Yan Xuetong has summarized: ⁸⁹¹

The US itself has, over past decades, been able to both enjoy the advantages of international trade and, simultaneously, insulate its internal economy from external shocks. Since the mid-1970s it has, however, forfeited that advantage through corporate driven 'off shoring' of its industrial base.

The United States of America has, indeed, become, militarily, the most powerful sovereign nation in the world. Its armed forces and supporting institutions eclipse those of all other nations and it has, historically, been all too ready to impose its will on others through either explicit or implicit military threat. The United States is inexorably morphing into what Arthur Nwankwo described as a 'cimilicy'. [Risa Brooks et al](#) explained:

...[O]ver the past three decades, civilian control has quietly but steadily degraded. Senior military officers may still follow orders and avoid overt insubordination, but their influence has grown, while oversight and accountability mechanisms have faltered.

Today, presidents worry about military opposition to their policies and must reckon with an institution that selectively implements executive guidance. Too often, unelected military leaders limit or engineer civilians' options so that generals can run wars as they see fit.

[The United States has always invaded other nations for their own good 🇺🇸](#)

As it has become addicted to imposing its will on other nations, [responsibility for political oversight of military authorities](#) and activities in the United States has, over the past half-century, been progressively 'streamlined', short-circuiting long-established political safeguards against the possibility of impulsive war making.

Barbara Torreon and Sofia Plagakis, in a 2019 updating of a *Congressional Research Service* report entitled *Instances of Use of United States Armed Forces Abroad, 1798-2019*, have provided a list of them. Despite being a depressingly long list (grown exponentially since the advent of the post-Second-World-War 'Cold War' rivalries), however, it fails to include the much longer list of 'special forces' and CIA-fomented involvements in coup and counter-coup activity around the world. And, as the authors say,

The following list reviews hundreds of instances in which the United States has used military forces abroad in situations of military conflict or potential conflict to protect U.S. citizens or promote U.S. interests. The list does not include covert actions or numerous occurrences in which U.S. forces have been stationed abroad since World War II in occupation forces or for participation in mutual security organizations, base agreements, or routine military assistance or training operations. (Barbara Salazar Torreon and Sofia Plagakis, ^œ[Instances of Use of United States Armed Forces Abroad, 1798-2019](#), Congressional Research Service, 7-5700, R42738, Updated July 17, 2019)

But, of course, the United States has always invaded other nations for their own good! Jacqueline Hazelton has explained:

After two decades, the United States is finally leaving Afghanistan, and only 2,500 U.S. troops remain in Iraq. In both countries, the insurgencies continue. It wasn't supposed to end this way. In both wars, Washington hoped that imposing democratic reforms could protect the population, win hearts and minds, and defeat the insurgency.

That, after all, was the narrative spelled out in the vaunted ^œ[U.S. Army/Marine Corps Counterinsurgency Field Manual](#), published in 2006, which was intended to guide both campaigns. Drawing from Western practitioners' accounts of successful counterinsurgency

campaigns over 60 years, the document argued that good governance - including democratic reforms - defeats insurgencies. "Soldiers and Marines are expected to be nation builders as well as warriors," two generals, David Petraeus and James Amos, wrote in the manual's foreword. "They must be able to facilitate establishing local governance and the rule of law." A 2005 article in the journal *Military Review* by another pair of officers - Peter Chiarelli and Patrick Michaelis - made the same case: "A gun on every street corner, although visually appealing, provides only a short-term solution and does not equate to long-term security grounded in a democratic process." Governments must limit civilian casualties, they noted, because harming the population only bolsters support for the insurgency.

Civilian policymakers have made similar points. In 2009, the Center for a New American Security, the liberal-leaning U.S. think tank, recommended that a top priority for the United States should be to "promote democracy, the rule of law, and human rights in Afghanistan and the region."

(Jacqueline L. Hazelton, ["The Hearts-and-Minds Myth: How America Gets Counterinsurgency Wrong,"](#) *Foreign Affairs*, July 15, 2021)

Rory Stewart summed up the US 'intervention' in Afghanistan - though of course 'The age of intervention' began long before Bosnia in 1995:

The extravagant lurches of the U.S. intervention in Afghanistan - from a \$1 trillion surge to total withdrawal, culminating in the reestablishment of a Taliban government 20 years after the 9/11 attacks - must rank among the most surreal and disturbing episodes in modern foreign policy.

At the heart of the tragedy was an obsession with universal plans and extensive resources, which stymied the modest but meaningful progress that could have been achieved with far fewer troops and at a lower cost. Yet this failure to chart a middle path between ruinous overinvestment and complete neglect says less about what was possible in Afghanistan than it does about the fantasies of those who intervened there.

The age of intervention began in Bosnia in 1995 and accelerated with the missions in Kosovo, Afghanistan, and Iraq. Over this period, the United States and its allies developed a vision of themselves as turnaround CEOs: they had the strategy and resources to fix things, collect their bonuses, and get out as soon as possible. The symbol of the age was the American general up at 4 am to run eight miles before mending the failed state.

(Rory Stewart, ["The Last Days of Intervention: Afghanistan and the Delusions of Maximalism,"](#) *Foreign Affairs*, November/December 2021)

Supplying Weaponry to those fighting for 'Freedom': Ir's Win-Win: Do Well and Do Good! 🇮🇷

Not only has the United States engaged in military adventures around the world, it has been just as active in supplying weaponry to buyers around the world. And, of course, this is [not a recent phenomenon](#). In 2016, an attempt was made in the US Senate to rein in arms sales to Saudi Arabia in the hope that this would limit its destructive attacks on Yemen but this was thwarted by President Trump ⁸⁹².

The US State Department's summation of ^œ[World Military Expenditures and Arms Transfers](#) (2019 edition) has provided a synopsis of Arms Transfers around the world in 2019:

Arms transfers

During the eleven-year period [2007-2017], about 79% of the world arms trade, by value, appears to have been supplied by the United States, about 10% by the European Union, about 5% by Russia, and less than 2% by China. There was no clear trend in either the U.S., the Russian, or the Chinese market share during the period.
(^œ[World Military Expenditures and Arms Transfers:2019 edition](#), U.S. Department of State Bureau of Arms Control, Verification and Compliance)

Presumptuous hubris has, over the past half century and more, become the hallmark of US presidential foreign policy. None demonstrate this more clearly than Donald Trump. But, he is [not unique in his impetuous presumption](#) of the right to extend his powers beyond those ceded to past Presidents⁸⁹³ by the US Congress under the 'authorizations for use of military force (AUMF)'.

It seems to have become inevitable that each US president ([including Eisenhower](#) at the end of his 2nd term) will look for a sovereign country against which to exercise his prerogative of 'regime change'. And, of course, this is not a recent phenomenon. As Martin Luther King put it in the 1960s 'Vietnam era':

A nation that continues year after year to spend more money on military defense than on programs of social uplift is approaching spiritual death.....

I knew that I could never again raise my voice against the violence of the oppressed in the ghettos without having first spoken clearly to the greatest purveyor of violence in the world today -- my own government. ...

(Martin Luther King, Jr., ^œ[Beyond Vietnam -- A Time to Break Silence](#), Delivered 4 April 1967, Riverside Church, New York City)

As President Biden awaited his turn in the US White House following his 2020 presidential election victory, among the questions asked was: What will the US president's attitude be toward those 'socialist', 'authoritarian' Central and South American states which have been on the receiving end of US 'concern' through the Trump presidency? How would Bolivia and Venezuela fare under President Joe Biden?

Biden, as US Vice President, served as the United States' principal emissary to Latin America and the Caribbean between 2008 and 2017. The experiences of Venezuela and other 'left-leaning' states over those years were less than inspiring, but perhaps Biden, as President, would be less hell-bent on 'reforming' socialist states than his predecessors. As Michael Camilleri wrote,

President-elect Biden will bring to the Oval Office a greater knowledge of hemispheric relations than any of his recent predecessors. But he will also confront a Latin America buffeted by political, economic, and health crises - and by the legacy of the Trump administration's sporadic and politically driven engagement....

Many Latin Americans welcomed Biden's election as a reprieve from the Trump administration's insults, bullying, and propensity to view the

region through the lens of electoral politics. Biden has criticized Trump for abdicating U.S. leadership in the region and called for a return to shared responsibility, respect, and partnership.

The president-elect's repudiation of Trump's 'America first' philosophy and his pledge to revitalize the multilateral system will resonate powerfully in the region. Biden's strong track record in Latin America and the Caribbean - and the simple fact that he is not Donald Trump - will serve him well in the endeavor to restore U.S. leadership in the hemisphere

(Michael J. Camilleri, ⁸⁹[Biden's Latin American Opportunity](#): Why the Western Hemisphere Is More Important Than Ever, *Foreign Affairs*, December 28, 2020)

President Biden had an opportunity to radically change US attitudes toward those states which determine to govern for the 99% and use their resources and talents to benefit the disadvantaged and disenfranchised members of their nations.

It seems to have been a forlorn hope that this would eventuate.

He had a long history of US 'interventionism' to alter - but he has chosen instead to perpetuate the hubristic US policies of the past.

The Trump Administration's outright belligerence toward China has, if anything, been amplified in the first months of the Biden presidency. Rachel Cheung and Benjamin Wilhelm described the tone of the first top-level meeting between China and the US:⁸⁹⁴

Even the most optimistic observers had expected little to come out of last week's U.S.-China summit in Alaska, where high-level officials from both sides met in person for the first time since President Joe Biden took office. But as the heated on-camera exchange that preceded the private discussions confirmed, not only will this rivalry remain, but relations that were strained under former President Donald Trump may further deteriorate in the years to come.

Yang Jiechi, as reported by Patrick Lawrence, summed up China's attitude to the Biden team's foreign policy style:

Yang Jiechi, who once served as Beijing's ambassador to Washington.... "I think we thought too well of the United States," he said to Blinken across long, linen-draped tables in Anchorage. "We require the U.S. to treat China and Sino - U.S. relations in an objective and rational manner, discard the Cold War and zero-sum thinking, and respect China's sovereignty, security, and development interests." (Patrick Lawrence, ⁹⁰[The Blundering Biden Team](#), *Consortium News*, March 23, 2021)

Antony Blinken, Biden's secretary of state, signaling the continuation of US foreign policy attitudes and actions in the Americas, explained: Biden would seek to "more effectively target" sanctions on Venezuela, which aim to oust President Nicolas Maduro.

Apparently, in 2021, very little has changed on the US foreign policy front: Any presumption around the world that a change of leadership in Washington would signal a change in foreign policy style and substance can now be put aside. Trump has coarsened the US diplomatic style in its dealings with other nations and Biden and his team see no reason to alter it!

U.S. Secretary of State Antony Blinken said on Tuesday "the path to diplomacy is open right now" with Iran over its 2015 nuclear deal but would not address whether the Biden administration has had any direct engagement with Iranian officials.

"The path to diplomacy is open right now. Iran is still a ways away from being in compliance (with the deal). So we'll have to see what it does," Blinken told National Public Radio according to a transcript provided by the broadcaster.

Asked if there was any move under way to resume direct diplomacy, Blinken pointed to U.S. President Joe Biden's public stance that if Iran resumes compliance with the 2015 nuclear deal the United States would do so too.

"The president's been very clear publicly, repeatedly, about where we stand. And we'll see what, if any, reaction Iran has to that," he said.

The interviewer noted Blinken had not directly answered the question and asked: "but you're not ruling out that direct diplomacy might be somewhere in the future here?"

Blinken responded: "Well, at some point, presumably, if there's going to be any engagement on this, that would have to require diplomacy. That's what we're in the business of."

([U.S.'s Blinken: 'The path to diplomacy is open right now' with Iran](#), *Reuters*, February 17, 2021)

Medea Benjamin and Nicolas Davies summed up the problem with this 'new' 2021 US Iran policy:

While it was the United States under Trump that withdrew from the nuclear agreement, Biden is taking the position that the U.S. will not rejoin the agreement or drop its unilateral sanctions until Iran first comes back into compliance. After withdrawing from the agreement, the United States is in no position to make such demands, and Foreign Minister Zarif has clearly and eloquently rejected them, reiterating Iran's firm commitment that it will return to full compliance as soon as the United States does so.

Biden should have announced U.S. re-entry as one of his first executive orders. It did not require renegotiation or debate....

(Medea Benjamin and Nicolas J. S. Davies, [Is Biden Committing Diplomatic Suicide Over the Iran Nuclear Agreement?](#), *CounterPunch*, February 16, 2021)

Jessica Mathews has summed up the 2021 international reality within which the US has apparently decided to 'restore' its pre-Trump foreign policy approach to the rest of the world:

For years, Joe Biden has portrayed the presidency of Donald Trump as an aberration from which the United States can quickly recover.

Throughout the 2020 U.S. presidential campaign, Biden asserted that under his leadership, the United States would be "back at the head of the table." But a return to the pre-Trump status quo is not possible. The world - and the United States - have changed far too much. And although hailing the return of American hegemony might seem comforting to Americans, it reveals a degree of tone-deafness to how it sounds to the rest of the world.

When people elsewhere look at Washington's track record over the past two decades, they don't see confident leadership. What they see, instead, are a series of disasters authored by Washington, chief among them the 2003 invasion of Iraq and the subsequent destabilization of much of the Middle East and the 2008 global financial crisis. During those decades, Washington also pursued an ineffectual war in Afghanistan, an incoherent policy in Syria, and ill-judged humanitarian interventions, most notably in Libya.

The failures have also been domestic. To date, the United States has handled the COVID-19 pandemic worse than any other major country. Americans make up only four percent of the world's population but account for a staggering 25 percent of global COVID-19 cases and 19 percent of deaths from the disease. The failure has come at all levels: a stunning lack of national leadership, an alienated population unwilling to make modest sacrifices in the common interest, and a health-care system that is deeply inequitable and administratively fractured. (Jessica T. Mathews, ^œ[Present at the Re-creation? U.S. Foreign Policy Must Be Remade, Not Restored](#), *Foreign Affairs*, March/April 2021)

[It's Not Regime Change! It's Freeing the Oppressed from Tyranny! 🇺🇸](#)

 (01/01/23) (10/02/23) (12/02/23) (06/08/24) (08/12/24) (17/12/24) (20/12/24) (02/02/25)

The [hubristic belief of Western powers in their right to invade, subjugate and decide the fates of other nations and peoples](#) never ends!

As 2024 draws to a close interference in the internal affairs of sovereign nations and the associated killing seems to have gone into hyperdrive. The United States, its varied vassals and proxies, with their [surrogate 'regime change' organizations](#), are attempting to ensure that the world remains subordinate to their will.

Elections which do not result in victories for their approved candidates are declared 'illegitimate' and nations and peoples which will not bend to their will are bullied and invaded.

With the 2024 Christmas and New Year festivities gaining momentum in The West, so have its regime change activities.

Syria, economically undermined and destroyed by sanctions and by the appropriation of its resources by the United States and Israel, has collapsed, white-anted by both Western and Turkish surrogate regime change organizations and political maneuverings.

As always, the overt players in the destruction of Syria over two decades are merely surrogates of a dying empire and [its last 'settler colony', Israel](#).

No, what has happened is not the result of a 'corrupt' and brutal Syrian government! Syria, [as we have already seen](#), has been, and is now, victim of a twenty year campaign to discredit and destroy the nation.

Weep for the people of Syria!! Victims of the same ^œ[callous Western brutality](#) which has been endured by peoples around the world over more than 500 years.

And, as if that were not more than enough, Western surrogates have been hard at work engineering 'regime change' in nations bordering the Russian Federation.

Labelling political actors as 'far right' or 'far left'⁸⁹⁵, Western surrogate organizations have organized campaigns and coups undermining those they oppose

The Romanian constitutional court annulled the country's presidential election on December 6. A runoff was due to take place just 48 hours later between far-right independent candidate Calin Georgescu and progressive, pro-western alternative Elena Lasconi.

This decision is unprecedented in Romanian history. It followed the declassification of documents by Romanian intelligence services that exposed evidence of voting manipulation through social media platforms, illegal campaign financing on TikTok, cyber-attacks orchestrated by external forces and suspected Russian interference.

The second round of voting was originally scheduled for December 8 for Romanians residing in the country. Romanians living abroad had a three-day voting window starting on December 6. The delayed enforcement of the election's annulment resulted in nearly 48,000 Romanians casting votes that were ultimately invalid...

(^œ[Why Romania's election was annulled - and what happens next? *The Conversation*, December 17, 2024](#))

And:

TBILISI, Nov 30 (Reuters) - Many thousands of demonstrators gathered late on Saturday in Georgia's capital Tbilisi, building barricades, breaking windows and setting off fireworks outside parliament, in protest against the government which called off talks to join the EU. Riot police responded by firing water cannon and tear gas into the crowds. The demonstrations were by far the biggest since the increasingly anti-Western ruling party was re-elected last month in a vote the pro-EU opposition says was rigged....

(Felix Light, ^œ[Many thousands rally to oppose Georgian government after break with EU, *Reuters*, December 1, 2024](#))

Of course, all this is merely a continuation of the flailing attempts of a dying Empire to prolong its hegemony.

The first 2019 victim of US hubris was Venezuela. It had, for 15 and more years, been targeted by US 'sanctions'; economic and diplomatic undermining⁸⁹⁶; distortions of the truth; blatant lies; sponsorship of 'dissidents'; and maneuverings to gain [control of the nation's vast oil reserves](#) through 'privatization'.⁸⁹⁷

And, in 2020, Nicolas Maduro - the *duly elected president of Venezuela* - finally, moved to accommodate US demands for privatization of the oil reserves in order to keep the Venezuelan economy afloat. Sadly, of course, accommodating US demands is accommodating the demands of a schoolyard bully. Such capitulation signals only weakness to bullies. As Bolivia found, accommodating the demands for US regime change does not lessen US determination to eradicate 'left-wing', 'socialist' sympathies (equated with and signaled in such phrases as 'Venezuela's "authoritarian leader"' and 'years of gross mismanagement and corruption') in target nations ⁸⁹⁸.

In 2020 the United States administration, through its surrogate, the International Monetary Fund (IMF), demonstrated the depths to which it will sink in pursuing its regime change agendas around the world⁸⁹⁹. In a time of deep crisis, with the Covid-19 pandemic impacting Venezuela, the US not

only maintained its crippling sanctions against the nation but was also complicit in refusing IMF funding to the nation in its fight against the pandemic⁹⁰⁰.

Marjorie Cohn, in 2019, summed it up:

Trump and the real troika of tyranny - Bolton, Secretary of State Mike Pompeo and U.S. envoy for Venezuela Elliott Abrams - have failed in their coup attempt against the democratically elected Venezuelan President Nicolas Maduro. Trump's troika, egged on by Sen. Marco Rubio (R-Florida), are seeking to substitute U.S. puppet Juan Guaidó for Maduro as president of Venezuela....

Why is Trump's troika so intent on regime change in Venezuela and sanctions in Cuba, Venezuela and Nicaragua?

Last month, Bolton addressed the Bay of Pigs Veterans Association on the 58th anniversary of the Bay of Pigs invasion, in which the U.S. aided and abetted a failed attempt to overthrow Cuba's Fidel Castro. "Together, we can finish what began on those beaches," Bolton said, adding, "We must reject the forces of communism and socialism in this hemisphere."

It's not simply anti-communism that animates the Trump administration's fixation on sanctions and regime change in these Latin American countries. "With at least a half-million voters who were born in Cuba, Venezuela, Colombia or Nicaragua - and more with ancestral roots in those countries - it's a constituency that could prove pivotal in November 2020 in a state that's essential to Trump's reelection fortunes," Marc Caputo wrote at Politico.

U.S. strategies on Cuba and Venezuela intertwine in an insidious way, and Senator Rubio is pivotal in both. "Venezuela is really an extension of the position on Cuba," according to Ricardo Herrera, director of the Cuba Study Group. The Wall Street Journal reports that both countries are part of a plan to reassert U.S. dominance in Latin America and finally destroy the Cuban Revolution.

Moreover, corporate America wants to get its hands on Venezuela's oil. Bolton said in January, "We're in conversation with major American companies now.... It will make a big difference to the United States economically if we could have American oil companies really invest in and produce the oil capabilities in Venezuela."

(Marjorie Cohn, ["Trump's 'Troika of Tyranny' Meddles in Venezuela, Cuba, Nicaragua, Truthout](#), May 3, 2019)

In 2019, Venezuela's elected government was declared 'illegitimate' and a US groomed alternative set up to usurp the sovereignty of the nation.

That failed but not for want of trying. For the next four years Venezuela would suffer continual interference from United States' operatives and its mainstream media.

In July 2024, with Biden's first term in office coming to a faltering end as he sank into advancing dementia, his administration doubled down on US condemnation of Venezuela for 'interference' in its own elections.

Matt Spetalnick and Phil Stewart for *Reuters*, in a report entitled ["US accuses Venezuela of election manipulation, leaves door open to sanctions"](#) (July 30, 2024) described the immediate reaction of the US Administration to the 'unfavorable' election result:

The Biden administration said on Monday that electoral manipulation had stripped Venezuelan President Nicolas Maduro's claim of reelection victory of "any credibility," and Washington left the door open to fresh sanctions on the OPEC nation.

Senior U.S. officials, briefing reporters on Sunday's election, sharpened Washington's response to the disputed vote, in which Venezuela's electoral authority declared Maduro had won a third term, extending 25 years of socialist party rule.

Independent exit polls pointed to a landslide opposition win. The U.S. and a number of other governments cast doubt on the official vote count. Maduro's opposition rival, Edmundo Gonzalez, asserted that he was the true winner.

The U.S. officials, speaking on condition of anonymity, amplified public demands by President Joe Biden's senior aides that Maduro publish a detailed tabulation of votes and said a failure to do would leave the international community unwilling to accept the announced outcome.

Anna Merlan, in an article entitled 'Disinformation Peddlers Use Venezuela Chaos to Stoke Fears of Anti-Trump Vote-Rigging: Believe it or not, MAGA has turned against a president accused of stealing an election', described the immediate reaction of the United States Administration to the 'wrong' person winning the election.

The article, skewed toward US mainstream media disenchantment with the 'legitimacy' of Venezuela's administration, needs a lot of fact checking but provides a picture of the way in which in a 2024 US presidential election year, both sides in the contest linked the 'Venezuelan election fraud' to similar activities imputed to their opposing party within the United States:

The aftermath of Sunday's elections in Venezuela has been sustained chaos, with both incumbent President Nicolás Maduro and his opponent Edmundo González Urrutia declaring victory. Masses of protesters have poured into the streets, calling on Maduro to step down. Hundreds have been arrested; some have been killed.

In the United States, pro-Trump disinformation peddlers seized the opportunity to darkly warn that similar chaos and authoritarianism would befall the United States if their candidate loses in November. It's a topsy-turvy bit of discourse that has political figures who aren't bothered by Trump's attempts to stay in office after losing taking sides against another leader who they argue is doing the same thing.

Venezuela's recent voting was marred by allegations of impropriety by Maduro's United Socialist Party, who have become crushingly unpopular over his 11-year reign, as inflation has soared, social programs gone bankrupt, and millions of people fled. This week wasn't the first time forces supporting Maduro have been accused of election interference, and obvious attempts at voter suppression were on display in the lead-up to this election, as critics warned international election observers were being kept from monitoring voting....

(Anna Merlan, ^œ[Disinformation Peddlers Use Venezuela Chaos to Stoke Fears of Anti-Trump Vote-Rigging: Believe it or not, MAGA has turned against a president accused of stealing an election](#), *Mother Jones*, July 31, 2024)

Rebecca Koenig, in a U.S. News article on the ubiquitous nature of bullying in US workplaces has summed up the nature of US style bullying:

Signs of Bullying

Workplace bullying behavior is more serious and enduring than the mere incivility of an occasional rude remark from a co-worker. Types of bullying include:

- Verbal abuse
- Threats
- Humiliation
- ^œ[Gaslighting](#)
- Ostracism or isolation
- Withholding resources or information
- Intimidation
- Sabotage
- Reputation damage due to rumors
- Unfairly negative evaluation of work

...Some personality traits are linked to aggressive behavior. People who are emotionally unstable, easily angered or irritated, unconscientious about following rules or uncaring about others' feelings are more likely to become bullies, Bowling says.

Although they are not at fault, targets of bullying may share some traits, too. There are different schools of thought about what makes someone a target. They tend to be ethical and honest, technically competent in a way that makes bullies feel threatened and lacking in political intelligence, says Gary Namie, psychologist and director of the Workplace Bullying Institute. They may look like easy targets unlikely to resist abuse or may have habits or personality traits that bullies find provocative, Bowling says.

(Rebecca Koenig, ^œ[Battling Bullying in the Workplace](#), *U.S. News*, Dec. 13, 2017)

It seems that bullying has become an ingrained US personality trait, commonplace among those who rise to positions of authority and power in the nation. Inevitably, US foreign policy and practice are driven by and reflect those traits.

One need look no further than the 2019 and 2024 experiences of the elected Venezuelan government at the hands of the US' 'Main Stream Media', its politicians and their support staffs for examples of such behavior.

In 2021, US 'exceptionalism' was once again on show: The Biden administration decided that the Trump administration's tactless belligerence and sanctions diplomacy was a foreign policy style to be emulated! David Goldman described Biden's descent into Trump style 'sanctioning':

The Biden Administration last week set a new historical record by threatening sanctions against Germany, India, Russia and China in the space of 72 hours. Germany and India are, or at least were, American allies.⁹⁰¹

In this topsy-turvy 21st century the moral high-ground is occupied by Russia and China and the presumptuously bullying, sanctioning and 'regime change' low-ground is occupied by the United States and its acolytes. ⁹⁰² As [Bouthaina Shaaban described](#) of Syria:

...[T]he Western calls for democracy and freedom... caused the entry of ... hundreds of thousands of terrorists into our country, ...caused the destruction of our schools, of our infrastructure [and] moved our country a hundred years backwards.

Aaron Maté concisely spelt out the truly horrific reality. Western determination to 'free' populations trapped in what they self-servingly describe as 'brutal dictatorships' has, time-and-again, produced consequences such as these:⁹⁰³

The Syrian government, backed by Russia, Iran, and the Lebanese resistance group Hezbollah, was ultimately able to defeat the US-backed sectarian contras and regain control of about 70% of the country. But the damage was incalculable: hundreds of thousands of dead, millions displaced, industrial and agricultural capacity decimated. A state that once enjoyed some of the highest medical, educational, and food production levels in the Middle East was left divided, hungry, and impoverished.

The ^œUS invasion of Syria and occupation of Syrian territory in defiance of the elected Syrian Government (which, of course, it has proclaimed an 'authoritarian' and 'totalitarian' government, 'justifying' its occupation) without Congressional approval and in defiance of the United Nations and the international 'Rule of Law', is, by all standards of both United States and international law, illegal.

Brian Finucane has explained:

Both domestic and international laws restrict war making, and thus, in principle, the president is restrained from unilaterally using military force whenever he or she desires.

U.S. law makes exceptions for cases of self-defense and conflicts that are approved by Congress, and international law similarly allows for self-defense and force approved by the UN Security Council. But with both Congress and the UN Security Council reluctant to approve conflicts for both policy and political reasons, the U.S. government has figured out creative ways to circumvent these bodies.

Nowhere is that clearer than in Syria, where successive U.S. administrations have engaged in clever legal maneuvering to fit a wide range of U.S. operations within the scope of domestic laws.

The original rationale for going to war in Syria in 2014 was to fight ISIS and al Qaeda. Although Congress did not authorize the campaign against ISIS in advance, it subsequently appropriated funding for U.S. counter-ISIS operations. Yet since 2016, U.S. forces in Syria have also battled a handful of other foes with no congressional authorization or even debate....

(Brian Finucane, ^œAn Unauthorized War: The Shaky Legal Ground for the U.S. Operation in Syria, *Foreign Affairs*, January 11, 2022)

'On 6 February 2023, a series of violent earthquakes struck southern and central Turkey and northern and western Syria.... They occurred 34 km (21 mi) west of the city of Gaziantep at 04:17 a.m. TRT (01:17 UTC),... causing widespread damage and tens of thousands of fatalities in the region. With a maximum Mercalli intensity of IX (Violent) and a magnitude of at least Mww 7.8, the main earthquake is tied with the 1939 Erzincan earthquake as the strongest recorded earthquake to hit Turkey in modern times... and is one

of the strongest earthquakes ever recorded in the Levant.' (cf ^œ[Wikipedia](#) accessed February 9, 2023).

A day later, appeals were still being made for all those nations which have imposed sanctions on Syria⁹⁰⁴ to lift them without restriction so that desperately needed assistance could flow unhindered to the millions in need. The response:

Though several countries including the United States and its allies have extended their support to Turkey in its relief and rescue work, they have refused to extend similar assistance to Syria. The U.S. State Department made it clear on Monday that it was only willing to support some work carried out in Syria by NGOs, but that it would have no dealings with the Bashar al-Assad government. "It would be quite ironic - if not even counterproductive - for us to reach out to a government that has brutalized its people over the course of a dozen years now," ^œ[State Department spokesperson Ned Price said](#), as quoted by Al Jazeera.

(^œ[Sanctions imposed by US and allies hamper relief and rescue work in earthquake-devastated Syria](#), *Peoples Dispatch*, February 07, 2023)

And three days later, with thousands dead and millions without shelter, food or medical aid:

"We, the three patriarchs with the heads of churches in Syria, demand from the United Nations and the countries imposing sanctions on Syria to lift the embargo and the unjust sanctions imposed on the Syrian people, and to take exceptional measures and immediate initiatives to secure the delivery of the much-needed relief and humanitarian aid," the church leaders said in a statement.

We appeal to governments, international organizations, NGOs, charities, and peace advocates everywhere to expedite the support of relief and rescue efforts, irrespective of any political consideration," the prelates said.

The three patriarchs based in Syria are Melkite Catholic Patriarch Joseph Absi; Syriac Orthodox Patriarch Ignatius Aphrem II and Greek Orthodox Patriarch John X.

"We also appeal to the conscience of all the people of goodwill to advocate on behalf of the Syrians in order to put an end to their misery and enable them to live in dignity as envisioned by the Universal Declaration of Human Rights," the prelates said.

"This natural disaster adds to the ordeal of the Syrian people," the Syrian church leaders stressed, adding that the people continue to suffer "from the tragedies of war, crises, disasters, epidemics, and the harsh economic hardships.":

(Doreen Abi Raad, ^œ[Patriarchs, Heads of Churches Call for Lifted Sanctions, Aid for Syria After Earthquake Kills Thousands](#), *The Tablet*, February 9, 2023)

As 2022 drew to a close the world had been conditioned to forget about the [ongoing United States' occupation and looting of Syrian farmlands and oil fields](#).

Surely, with this [display of callous disregard for others](#) in February 2023, the world will refocus on the plight of a nation and people who have been subjected to unrelenting persecution.

Liu Xin, Hu Yuwei and Chen Qingqing summed it up:

The UN Refugee Agency told the Global Times that they echo the sentiments expressed by UN Secretary General Antonio Guterres, who said on Thursday, "This is a moment in which everybody must make very clear that no sanctions of any kind should interfere with relief to the population of Syria in the present moment."

Mick Wallace, a member of the European Parliament, tweeted on Tuesday that if the EU really cares about these people, "could they show it by ending their illegal sanctions on Syria which have killed so many innocent people?"

Blinken, the US' top diplomat, boasted in a tweet that the US was the "leading humanitarian donor" and the aid will "go to Syrian people, not the regime," to which Chinese Foreign Ministry spokesperson Hua Chunying commented: "Then why are they struggling? You've been bombing, sanctioning, and stealing from them, and now you praise yourself for your charity?"

The US' hypocrisy has been fully exposed in Syria. On the one hand, it imposes unilateral sanctions to isolate the country and strangle its development opportunities, leaving helpless Syrians digging their loved ones buried in rubble with their bare hands; and on the other, the US continues to exploit Syrian resources, especially its oil, by either directly stealing it through smuggling tankers or "buying" at unreasonably low prices, Ding said.

The US' apathy toward the Syrian peoples' misery shows how hollow its touting of human rights or democracy is, said the expert.

(Liu Xin, Hu Yuwei and Chen Qingqing, [Calls mount urging US to lift sanctions on Syria to facilitate humanitarian aid](#), *Global Times*, February 10, 2023)

Until this disaster, the Russian invasion and occupation of the Donbass Region of Ukraine had absorbed our attention. How easy it is for malign aggressors to deflect attention from their own misdeeds by propagandizing the world to the 'horror' of the 'misdeeds' of others.

As *Islam Times* explained in 2021:

US occupation forces continue to steal Syrian resources and agricultural crops from the areas they have occupied in the Syrian al-Jazeera, as the occupation forces took out a convoy of vehicles loaded with stolen barley from Syrian lands to northern Iraq via the illegitimate al-Walid crossing in al-Yaroubia countryside.

Local sources told SANA reporter that the convoy includes 50 trucks and a number of refrigerated containers that left the city of al-Malikiyah to the illegitimate al-Walid crossing, heading to Iraqi lands."

The sources pointed out that the American occupation has carried out systematic theft of grains produced from the Syrian fields, as it looted the wheat stored in al-Tawiba silo and in the warehouses of Nama Company.

([US Occupation Continues to Loot Syrian Grain](#), Story Code: 909506, *Islam Times*, 11 January 2021)

One had hoped that on the first day of 2023 'the curtain would come down on the brutal 11-year old Syrian conflict'. Could it really be possible that the United States had given up on its regime change ambitions in Syria? As Bhadrakumar explained:

The curtain is coming down on the brutal 11-year old Syrian conflict, which former US President and Nobel Laureate Barack Obama initiated, as the Arab Spring swept through West Asia two decades ago. The United States has suffered yet another big setback in West Asia as the year 2022 draws to a close. The unfolding Turkish-Syrian reconciliation process under Russian mediation is to be seen as a saga of betrayal and vengeance.

Ankara came under immense pressure from the Obama Administration in 2011 to spearhead the regime change project in Syria. Obama blithely assumed that Türkiye would gleefully serve as the charioteer of "moderate" Islamism for the transformation in West Asia. But Ankara took its time to calibrate its foreign policies to adapt to the Arab Spring before responding to the shifting landscape in Syria....

The US State Department stated recently, "The US will not upgrade its diplomatic relations with the Assad regime and does not support other countries upgrading their relations. The US urges states in the region to consider carefully the atrocities inflicted by the Assad regime on the Syrian people over the last decade. The US believes that stability in Syria and the greater region can be achieved through a political process that represents the will of all Syrians."

(M. K. Bhadrakumar, [Russia consolidates in East Mediterranean](#), December 31, 2022)

They say that hope springs eternal but any realistic hope of a change of heart by The United States following their contemptible response to the Syrian earthquake tragedy of 6 February 2023 has been dispelled.

The US has yet again waded into a Middle Eastern propaganda driven quagmire. It will take more than the past decade of mindless support of 'moderate rebels' spearheading and justifying its regime change ambitions and looting of Syrian resources for it to find a face-saving way out of the brutal debacle it has created and sustained since 2012!

The US military, in 2022, employing the fig-leaf of 'presidential approval', engaged in clandestine military operations around the world and invaded and occupied sovereign nations, confident that 'Congress, which... has grown accustomed as a body to dodging its responsibility for matters of war and peace', would not attempt to rein it in. It no longer accepts that it is subject to US Congressional oversight and control and it no longer accepts the constraints of United Nations rulings and long-established international law.

In the first half of the 21st century the world needs to know [who controls the US](#) military juggernaut. Without that insight, foreign policy 'negotiations' with the US become extremely difficult - [what we see seems not to be what is!](#)

US priorities in dealing with other sovereign nations in 2020 were well demonstrated in its dealings with Indonesia⁹⁰⁵.

From the 1950s attacks on Vietnam and surrounding territories, US presidents have not only engaged in unauthorized presumptuous [warmongering](#), they have presumed the prerogative of 'regime change' in other sovereign nations.

As 2019 drew to a close, the latest victim of US hubris, artfully presented as 'concern' for the 'rights' of citizens and the wellbeing of the planet, was Bolivia. Another 'socialist' South American nation was in the throes of

learning that 'socialism' leads to 'dictatorship'; to 'authoritarian rule'; to social turmoil; and so, with the help of those who are [practiced in the art of making the economies of other sovereign nations 'scream'](#), to regime change.⁹⁰⁶
